2. These rates will be based on a minimum production which will assure the daily earnings of an average worker under normal conditions of work, it being understood that this minimum production is to be established by agreement between the workmen interested and the employers.

3. Rules governing the spinning of each article should be communicated to the workwoman; this applies also to the verifying of pieces already spun, if she so desire. The method of accomplishing this should be agreed to in each factory by the workers and the employer.

4. In all cases where the minimum production established by agreement is not reached, for causes beyond the control of the workers, a normal day's earnings will still be paid, on condition that the spare time be employed in the service of the factory.

In case of disagreement, the matter in controversy shall be investigated by both parties, and if they can not agree the question shall be submitted to arbitration by a mixed commission.

5. When articles exactly similar are spun in several factories under the same conditions of production the rates shall be identical.

6. For loom setters, capable of supervising the section to which they have been assigned, and for all skilled loom mounters the minimum wage is fixed at 500 francs per month.

If the above-mentioned loom setters and mounters are engaged by the day, the day's wage shall be 20 francs. In this case, all overtime work shall be paid for at the rate of one and one-third times the usual rate.

7. In the future no conflict should take place until the mixed arbitration commission shall have been called upon thoroughly to study and discuss the questions at issue, with a view to avoid further misunderstanding.

Return to Piecework Rates in Germany.

ONE of the first economic effects of the German revolution was the refusal of German workers to work at piecework rates, and the consequent general decrease in output. It seems, however, that a change of mind has taken place recently with respect to piecework. Soziale Praxis¹ states that Vorwärts, the organ of the Social-Democratic Party, advocates piecework and a bonus system in an article which has received much attention. Payment by results is regarded as being absolutely necessary in State-owned establishments. The output of the railway shops has dropped to such an extent that there are not enough cars to carry even the reduced coal output. The transport crisis can not, however, be regarded as the only or chief explanation of the coal crisis. It may be the reason for the acute shortage which has been experienced at different times and places, but it does not account for the chronic shortage which only increased output can remedy. Nothing could be worse at the present moment, the article states, than to tell the miners that increased output will not avail because of the transport crisis. On the other hand, it is time to put an end to the state of affairs which now prevails in the railway shops. A large proportion of workers would welcome the declaration that in the railway shops some work shall be done in return for good wages. "Vorwärts is right," however, says Soziale Praxis, "when it refrains from confining the question of piecework wages to the railway shop workers but examines it in principle as the present situation demands, and rejects the old saying 'piecework is murder' (*Akkordarbeit ist Mordarbeit*)."¹ Vorwärts states:

Piecework, if reasonably applied, is the most just method for determining wages. The trade-unions have adapted their activities in past years accordingly: they never have waged a fight against piecework as such, but against the abuses to which it is subject. * * * Sensible workers will regard piecework as desirable inasmuch as it will enable diligent workers to earn a much higher wage than under the present time wages system.

In addition to the piecework system, consideration should also be given to the bonus system, which has been opposed in Germany while in Russia it has been advantageously adopted. The current wage rates were retained and standardized in Russia. They constituted the payment for the latest recorded output. Any output over and above this was awarded a bonus in addition to the standard wage. The bonuses were increased progressively. According to the reports received from the Soviet Government on the situation of the labor market, the bonus system has exercised an exceedingly favorable influence on production. In some factories output has increased 25 to 40 per cent in a short period.

The effect of the piecework and bonus systems would be increased if special coupons were given to the workers who exceeded a fixed minimum of work. This would

¹ Soziale Praxis und Archiv für Volkswohlfahrt, Berlin, Sept. 4, 1919, p. 879.

enable the workers to obtain the extra rations allowed to workers in the heavy and most fatiguing industries. In this way a worker who had applied himself with diligence and industry to his task in the interest of the community would be entitled to receive not only a larger number of paper money notes but also a larger supply of necessary foodstuffs, and thus be enabled to renew his strength.

The social-democratic publication is right, says *Soziale Praxis*, when it asserts that the German nation is so sick that it does not hear the doctor's advice to do more work. It needs a daring operation to force the process of recovery. The revolution, which led to the collapse of authority in the management of production, removed many barriers. At first the abolition of piecework was warmly welcomed, as it was thought that in a State in which all the people were imbued with a sense of duty there would be no necessity for any other incentive to work. Now the disappointment is great when it is realized that the sense of duty is not equal in all sections of the community.

Piecework Rates as an Incentive to Work.

IN AN article on piecework rates as an incentive to work,¹ *Soziale Praxis* says:

The introduction of piecework as a means of increasing the zest for work is being vigorously discussed among railwaymen. The reason for this is to be found in the orders issued by the minister of railways. These recommend the strict observance of the eight-hour day and the reintroduction of piecework as a means of combating the prevailing aversion to work in the railway workshops. Discussions have taken place in the Ministry of Labor between representatives of the Government and of the railwaymen's unions on ways and means of increasing the output of the railway shops. The General Union of Railwaymen has called a conference of the executive committee and expert officials to discuss the same problem. The Central League of Officials has also taken up the matter.

The representatives of the workers admit that there is some aversion to work, but the blame does not lie on workers only. To some extent railwaymen are exhausted after the arduous work during the war, and they should have had some rest. Bad materials and unpractical methods of manufacture and work are other causes of diminished output. Attention must therefore not be exclusively centered on the wage system, but an effort should be made to provide good materials and tools. Otherwise the workers would suffer if the piecework system were introduced, and would energetically protest against it. The system could be introduced for new work, but not for repair work.

In spite of this rejection of the piecework principle, the General Union of Railwaymen has declared itself in favor of the piecework system in certain works for a three months' test. The workers maintain that only far-reaching rights of participation in management can be effective in increasing the zest for work.

The right to participate in management should be granted as soon as possible. The minister of railways has issued instructions to the railway administrations that all preparations should be made for elections for the railway works councils to be held as soon as the works council law is promulgated.

¹ *Soziale Praxis* und Archiv für Volkswohlfahrt, Berlin, Sept. 18, 1919, p. 920.

It is not only among railwaymen, but also among other workers, that the value of the piecework system is being realized. In this connection the following award made by the State arbitration board at Brunswick on the occasion of the closing down of an automobile factory is worthy of attention:

The firm shall be entitled to close down its works as long as the economical operation of the works is endangered by the refusal to perform suitable piecework. As soon as the workers declare their willingness to undertake piecework the firm shall reinstate all its former staff. There shall be negotiations between the two parties as to the system of piecework, whether team or individual piecework or the bonus system, which should be adopted.

In some instances workers are returning voluntarily to the piecework system. One firm, Bergmann in Suhl, had given notice of dismissal to all its salaried employees and workers because the diminution of output had made it questionable whether operation could be carried on at a profit. The notices were, however, withdrawn because the workers declared that they were prepared to accept the piecework system. In the Zeiss Optical Works at Jena two votes were taken on the question. The first ballot showed no great inclination on the part of the workers to adopt piecework, but a big majority in favor was obtained on a second ballot.

Production Committees in Railway Workshops.

VORWÄRTS¹ reports that as a result of many complaints of lack of material and tools and against old-fashioned methods in the railway workshops, which, the railwaymen say, have greatly hindered production, the German Ministry of Railways has decided to reorganize the engine and carriage repair shops on a modern basis. The new system secures for the workers a large measure of the desired share in control. In November, 1919, the article states, "production committees" will be introduced in every workshop with the object of increasing output and organizing the work on modern lines.

The production committees will be invested with extensive powers. In each occupational group, for instance, locksmiths, turners, wheelwrights, smiths, clerks, etc., two employees will be appointed to supervise production in collaboration with the existing workers' committee or works council and to suggest reforms. Their duties will be to determine whether each worker is suitably employed and able to perform the required minimum of work; to consult the engineers and directors in individual works with regard to better methods of work and desirable innovations; to keep the stores well supplied so that repairs may not be unnecessarily delayed; and to act as liaison officers between the workshops and factories and the managing directors.

¹ Vorwärts, Berlin, Oct. 30, 1919.

A New Piecework System.

A NEW piecework system in operation in a Government railway repair shop is described in Vorwärts¹ as follows:

The former system of piecework must be considered as a thing of the past. This method, while securing a higher wage to the specially industrious or capable worker, failed to stimulate production as a whole.

A new system, which is of the nature of profit sharing, has led to increased production in the Government's railway repair shops at Golm-Mark. A commission, composed of a works manager, a delegate of the workers, and a railway official, calculates the number of hours necessary for the performance of a certain piece of work, on the basis of actual experience and average production.

While aiming at the highest possible technical perfection, the workers try to carry out the prescribed task in the shortest possible time. By a special scheme the saving in cost resulting from the difference between the actual number of hours worked and the calculated number is shared between workers and employers. Each individual worker is paid according to output and capacity on a scale arranged between the management and the workers. The resulting average of hours and wage rates is that for which payment is agreed upon in the repair contract. If, for instance, the agreed average price per hour is 2.30 marks² plus 180 per cent for general expenses (some such percentage is usually allowed to every firm of contractors as compensation for expenses) the following result will obtain:

A railway freight car, according to the standard calculated, requires 500 hours for repair. The work is actually performed in 408 hours, so that a saving of 92 hours is effected. Ninety-two, the number of hours saved, multiplied by 2.30 marks gives 211.60 marks. The 180 per cent for expenses amounts to 380.88 marks; the sum of the two is 592.48 marks. Half of this sum, or 296.24 marks, goes to the gang of 10 workers employed on the job. The combined wages of these 10 workers for the job in question were 947.90 marks. The extra compensation of 296.24 marks paid to them for the saving in time amounts, therefore, to somewhat over 31 per cent.

Newly employed workers are paid a share of the profits after 12 days' work with their gang. The standard number of hours fixed by the commission is not reduced when the worker receives higher wages.

This system has already been in use in the workshops for four months. As a result production has increased 100 per cent. Another advantage is that the employment of supervisors has become unnecessary. Further, if any member of a gang shows a lazy disposition, the other members refuse to incur the loss of profit involved, and demand his dismissal.

¹ Vorwärts, Berlin, Oct. 4, 1919.

² Owing to fluctuations in exchange value conversions into United States money are not made. The normal par value of the mark is 23.8 cents.

Shorter Working Day in German Coal Mines.¹

ACCORDING to the *Kölnische Zeitung*,² certain representatives of the miners' unions are now opposing the early introduction of the six-hour shift in the coal mines. The *Bergarbeiterzeitung*, the journal of the Free (Social-Democratic) Miners' Union, demands that there shall be an international agreement with regard to the six-hour shift, and calls attention to England, which provides for this shift in 1921 only if the industrial situation allows it. At a meeting of the commission appointed to inquire into the working hours in the Ruhr district the workers demanded that the six-hour shift should be introduced on February 1, 1920, and it was clearly pointed out that if this demand were not acceded to by that date the workers would take by force what was not accorded them as an act of grace. The increasing coal shortage makes it plain that a serious danger lurks in any further curtailment of the working hours. At the beginning of February the shortage will be still more serious, and the necessity of increased output makes the curtailment of working hours out of the question.

The *Bergarbeiterzeitung* examines the question as to which is the country in which the shortest working hours for miners prevail. In France the eight-hour shift, "bank to bank," was made legal from July, 1919; but if national requirements demand it, the Government may, after hearing the views of the employers' and workers' organizations, lengthen the working hours. In Austria the eight-hour shift was introduced in July, 1919, while in Belgium, although no new regulations for the mines have yet been issued, the eight-hour shift also prevails. In Poland the shift below ground is between eight and eight and one-half hours, "bank to bank," while in Russia the eight-hour shift has been introduced by the Soviet Government, though in the Moscow and Don districts the shift is seven and one-half hours.

*Soziale Praxis*³ reports that the commission appointed to examine the question of working hours in coal mines in the Ruhr district met in Essen on December 8 and 9, 1919, and while there seems a prospect of an agreement between the employers and workers as regards certain questions, e. g., the housing problem, the transport system, food and clothing grants for miners, as regards working hours the views of the employers and workers are diametrically opposed.

With regard to the housing problem it was stated that, owing to difficulties that are well known, it will take between three and four

¹ See MONTHLY LABOR REVIEW, January, 1920, pp. 173-177, for an article on the same subject.

² *Kölnische Zeitung* Cologne, Dec. 21, 1919. Morning edition.

³ *Soziale Praxis und Archiv für Volkswohlfahrt*, Berlin, Dec. 18, 1919.

years to provide 70,000 homes for about 100,000 miners. With regard to transport, conditions are comparatively satisfactory, for about 15,000 cars are now available, which are sufficient for the transport of 150,000 metric tons of newly mined coal and 10,000 tons from the dumps, so that by the end of February all the dumps should have been removed.

In the matter of working hours the chairman of the commission, Prof. Gothein of Heidelberg, gave an alarming account of the grave consequences of the coal shortage. Many branches of industry in South Germany, he said, had been obliged to close down and many others would shortly have to follow suit. Electricity and gas works could provide only half their normal output, and many had closed temporarily, with the result that factories had closed and the workers were starving. In Heidelberg gas was being produced from wood, whose acid content injured the gas pipes. The Berlin metal workers had sent a deputation to Essen to beg the miners to produce more coal.

In view of this situation the employers are unconditionally opposed to any curtailment of the shifts, and actually demand their temporary prolongation from seven hours to eight. But the workers cling obstinately to their demand that from February 1, 1920, the six-hour shift must be introduced. Under the old conditions the average life of a miner was only 45 years, and miners now claim that they can not be blamed for desiring to prolong their lives. Justifiable as their claims may be, at the present juncture the country's requirements should take first place. Prof. Francke appealed to the workers to recognize this, and pointed out that should the Ruhr district be occupied by the Entente by reason of nonfulfillment of the treaty terms the miners would probably be compelled to work eight or nine hours, as in the Saar district. Attempts to arrive at a compromise between the two opposed views failed.

MINIMUM WAGE.

Minimum Wage for Women in Hotels and Restaurants in District of Columbia.

By CLARA E. MORTENSON.

THE conference called by the Minimum Wage Board of the District of Columbia to recommend a minimum wage for women employed in hotels, restaurants, apartment houses, clubs, and hospitals on February 3, 1920, reported that \$16.50 a week is the least sum with which a self-supporting woman in the occupations under inquiry can maintain herself according to proper standards. This is the same figure unanimously voted by the mercantile conference¹ on July 12, 1919, as the minimum living wage for women in that industry. The conference on the printing, publishing, and allied industries,² the first conference called by the Minimum Wage Board, on April 8, 1919, unanimously recommended a minimum wage of \$15.50 for women employed in the industries under consideration.

In the conference on the hotel, restaurant, and allied industries unanimity was not obtained. The employers' representatives voted against the recommendations submitted to the board.

The conference held nine meetings before a basis of agreement could be reached. The ordinary difficulties attending a just wage determination were augmented in the industries under consideration by the prevalence of the system of providing employees with room or board, or both, as part of their compensation. Should the existence of this system be recognized? If so, in what way? Three possible methods of solution were advanced during the conference: (1) That the conference should recommend a minimum wage, coupled with the stipulation that whatever accommodations were provided by the employer must be provided in addition to this wage. (2) That the conference should recommend a minimum wage, with the provision that if the employer furnished room or board the amount which he might charge for these accommodations should be agreed upon by the employer and employee in each specific case. (3) That the conference should recommend a minimum wage and also the maximum amounts which an employer who provided room or board might charge for these accommodations.

¹ See MONTHLY LABOR REVIEW August, 1919, pp. 199, 200; October, 1919, pp. 163, 164; November, 1919, pp. 217, 218.

² See MONTHLY LABOR REVIEW, May, 1919, pp. 217-219; July, 1919, pp. 165-167.

The representatives of the employees stated from the beginning that they preferred an all-cash wage. With this wage they would be in a position to eat and live wherever they chose. If an employer provided room and meals for his employees, such accommodations should be in addition to the minimum wage. The employers protested against such an arrangement, their main argument being that it would be practically impossible to prevent the employees who were handling food from eating what they wanted. This large group of workers would thus get their meals at the expense of the employer and have the money allowed for food in the minimum wage rate for other purposes.

The employers, however, were willing to pay an all-cash wage, provided that they could charge their employees for food and room, such charge to be a matter of individual bargaining between the employer and the employee. The workers objected to this scheme on the ground that the superior bargaining power of the employer would leave the actual determination of the charge largely in his hands. The employee would either have to accept his terms or look elsewhere for work.

Determining the Charge for Accommodations.

THE remaining proposition was that a minimum wage rate should be determined and also the maximum amounts which an employer who furnished room or board, or both, to his employees should be allowed to charge for these accommodations. This scheme was generally accepted as the best method of protecting the interests of all parties concerned. But the question at issue was, upon what basis should the fixed charge be determined—cost to the employer or value to the employee.

The representatives of the woman workers contended that the basis should be cost to the employer. They argued that generally speaking it was of advantage to the employer to have his employees live in the establishment. The "living in" system has been opposed for years by the workers and is gradually being broken down, but if in addition to the natural advantage of having the employees on the premises an employer was allowed to make profits on the accommodations provided them, the "living in" system with all its evils would be given a new lease of life. Theoretically, the employee would have the option of taking or leaving the job, but practically the person who controlled the job, the employer, would hold the option. The applicant for work would be told that a certain wage would be paid, from which would be deducted the legal allowance for room and board. Among an unorganized group of workers the tendency would be to accept for the time being the terms offered,

no matter how unsatisfactory they might be, rather than take a chance at finding other work.

The representatives of the employers, on the other hand, held that the basis of determination should be the prevailing rates for similar accommodations in the community. If \$3.50 a week was the least sum for which a woman could secure respectable lodgings, and the conference agreed that it was, then the employer who provided rooms for his employees should be allowed to deduct \$3.50 from the minimum wage. In the same way if \$1 a day, \$7 a week, was the least sum for which palatable and nutritious food could be obtained, and the conference was of the opinion that this was true, then the employer who furnished food to his employees should be allowed to deduct that sum from the minimum wage. In other words, the representatives of the employers held that if in the determination of the cash minimum wage a certain allowance was made for room and board, then that sum should be fixed as the charge which an employer who furnished his woman workers with these items could make.

Real difficulties were presented by the inequalities in food served employees in the different types of establishments and by the inadequacy of some of the rooming facilities provided. It was pointed out that three grades of food were served in the larger hotels, the rank and file of the employees getting the third or poorest grade. The women contended that this food was often unpalatable and even inedible, and they felt that an employer should not be allowed to charge the price of a wholesome meal for food which did not come up to standard. On the other hand, in the small restaurants, tea rooms, and cafeterias only one grade of food was served. In these establishments the employees probably ate more than one dollar's worth of food a day. Therefore a fixed price for a meal served employees would in some instances work a hardship on the employee and in other instances on the employer. Where could the line be drawn so as to secure a maximum of benefit with a minimum of hardship? Final agreement was reached on \$0.30 a meal, \$6.30 for 21 meals a week, and \$2 a week for rent. These figures represent a compromise between the cost to the employer and the value to the employee as measured by prices for which standard accommodations could be secured outside of the establishment.

The mercantile conference reporting in July, 1919, allowed \$4 a week for clothing. It was generally conceded that clothing prices had risen appreciably since that time and with little discussion the employees' estimate of \$4.50 was accepted. The clothing budget was as follows:

1 suit every two years.....	\$17.50
1 coat every two years.....	19.75
8 waists, at \$2.....	16.00
1 dress waist.....	7.00
1 wool dress every two years.....	12.50
1 wool skirt.....	10.00
2 summer skirts.....	5.00
1 dress-up dress every two years.....	15.00
3 hats—summer and winter work hats and dress hat every two years..	14.00
2 wash dresses, at \$8.....	16.00
4 pairs shoes, 2 pairs, at \$8, and 2 pairs, at \$4.....	24.00
3 pairs gloves—1 kid, at \$2.50, and 2 cotton, at \$1.05.....	4.60
12 pairs stockings, at 65 cents.....	7.80
2 corsets, at \$2.50.....	5.00
4 summer union suits, at \$1.25.....	5.00
3 winter union suits, at \$1.75.....	5.25
6 corset covers, at 80 cents.....	4.80
4 nightgowns, at \$1.50.....	6.00
2 white petticoats, at \$1.50.....	3.00
1 dark underskirt.....	3.60
2 dozen handkerchiefs, at 15 cents.....	3.60
8 aprons, at \$1.50.....	12.00
1 kimono.....	2.00
1 purse.....	1.50
1 umbrella every two years.....	1.50
1 pair rubbers.....	1.50
Repairs to clothing (suit, skirt, etc.).....	2.50
Repairing shoes.....	4.00
Neckwear—4 sets, at 50 cents.....	2.00
Miscellaneous.....	2.00
Total per year.....	234.40
Total per week.....	4.51

The two previous conferences had each allowed \$3.20 for sundries. The representatives of the employees asked for a material increase in this allowance, but 50 cents additional was all that was granted. This 50 cents was to cover increased laundry expenses and car fare rates.

Report of the Conference.

THE report of the conference, dated February 3, 1920, is as follows:

To the Minimum Wage Board of the District of Columbia:

The conference on the hotel, restaurant, apartment house, club, and hospital industries having completed its consideration of and inquiry into the subject submitted to it by the board reports its findings and recommendations as follows:

1. The conference finds that the minimum wage for women workers in the occupations under inquiry should be \$16.50 per week, and that any lesser wage is inadequate to supply the necessary cost of living to women workers in such occupations and to maintain them in health and to protect their morals. The figures upon which this wage is based are: Room, \$2; board, \$6.30; clothing, \$4.50; sundries, \$3.70.

2. The conference recommends:

(a) That the wage to be paid to any woman worker in a hotel, restaurant, apartment house, club, or hospital shall be not less than \$16.50 per week.

(b) That where the employer furnishes room or board, or both, to his employees he may make a charge for room of not more than \$2 per week, for board at not more than the rate of \$0.30 per meal or \$6.30 for 21 meals per week.

This report has been unanimously accepted by the Minimum Wage Board. In accordance with the law a public hearing must be held at which any person in favor of or opposed to the recommendations may be heard. The hotel men's section of the Merchants and Manufacturers' Association has signified its intention of protesting against the rates. The representative of the restaurant owners in the conference has refused to join with the hotel men in such protest. With sentiment divided the hearing promises to be a lively one. If, when the hearing is over, the board is still in favor of the recommended rates it will embody them in the form of an order which will become effective 60 days from date. Approximately 3,000 women will come within the scope of such an order.

Minimum Wage Law of Massachusetts.

BY AN act of the legislature of 1919 (chap. 350) the Minimum Wage Commission of Massachusetts went out of existence on November 30 of that year. The act named creates a department of labor and industries into which are consolidated the various State boards and commissions interested in industrial matters.¹ There is to be a commissioner of labor and industries who is the administrative and executive head of the new department. Three associate commissioners take over the functions of the minimum wage commission, and are charged with the executive duties formerly devolving upon the commission.

The commission in its final report expresses the hope that the essential features of the minimum wage work will be continued intact, and that its identity and individuality will be maintained. It says: "The work is distinctly different from that of the other labor boards and commissions with which it is joined. It is concerned directly with a special group—the unskilled, unorganized women and child workers in the State. The wage boards through which it functions involve distinct problems requiring a certain specialization in their treatment."

The minimum wage commission was established in July, 1913. During the six years of its existence wage investigations have been

¹ See pp. 209 to 213 of this issue of the REVIEW for an account of the organization of the new department.

conducted in 23 occupations, in 4 of which a second investigation has been made. In 16 of these, wage boards have been authorized, and in 14 minimum wage rates have been fixed. Inspections during the year showed substantially full compliance with the recommendations of the commission, and also indicate a considerable number of increases in wages paid.

Inspections covered 1,030 establishments, employing 24,815 women. Only 196 cases of violations, or less than 1 per cent of the entire number for whom records were secured, were found. Satisfactory adjustments were secured in nearly every case without recourse to legal action. The difficulty of determining with exactness the advances made on account of the decrees is recognized. However, it is believed that they have been largely beneficial, while in a number of cases employers have anticipated action by the commission by increasing rates of wages immediately following an investigation of their industry, without waiting for a wage board to make recommendations. Indeed, satisfaction is expressed over a changed attitude on the part of employers toward the minimum wage work. The hostility of past years seems largely to have disappeared, and many employers recognize that a minimum wage is to their interest as well as that of their employees, since it is a minimum and not a standard rate, and protects representative employers from unfair competition.

COOPERATION.

The Cooperative Movement in the United States.

By FLORENCE E. PARKER.

THE cooperative movement, or the Rochdale movement, as it is often called, is one of great social significance. It tends to substitute for the present system of private profit taking a condition of society under which every need of life, social and economic, will be supplied by the united effort of all. Though this aim is revolutionary, the method of attainment is gradual and peaceful. The movement is not political but economic. The cooperator as such takes no part in politics. One writer states that "the cooperator exercises his power chiefly through his economic vote, as a consumer."¹

The immediate object of the movement is the reduction of the cost of living by a system of exchange, as nearly direct as possible, between producer and consumer, the middleman and his profits being eliminated. The cooperator may set about to accomplish this object either as a consumer or as a producer. As a consumer the medium through which he works is the cooperative buying club or the cooperative store; as a producer it is some such organization as a farmers' marketing association.

The Rochdale Principles.

CERTAIN features inaugurated by the Rochdale cooperators have been adopted by their successors as guiding principles and characterize the movement wherever it exists. The leaders in cooperative organization continually urge that all societies should rigidly adhere to them. One authority says that failure to conform to these principles "is to abandon the cooperative idea and to invite failure."²

The principles are as follows:

1. Unrestricted membership, with shares of low denomination which may be paid for in installments.
2. Limitation of the number of shares to be held by any one member, to prevent wide inequality in the financial status of members.
3. Democracy in government, and each member limited to one vote, irrespective of the number of shares held.
4. Sale of pure goods at prevailing market prices.
5. Cash sales to avoid the loss attendant upon extension of credit and to enable the society to make the best use of its capital.

¹ Albert Sonnichsen: *Consumers' Cooperation*. New York, Macmillan Co., 1919, p. 196.

² Emerson P. Harris: *Cooperation the Hope of the Consumer*. New York, Macmillan Co., 1918, p. 179.

6. Payment of not more than a legal rate of interest on share and loan capital, the remainder of the "profits" (the surplus over cost price plus expenses of management), after making provision for depreciation, reserve, and educational fund, to be returned as a dividend to members in proportion to their patronage.

History of Cooperation in the United States.¹

STARTED in Rochdale, England, in 1844 by 28 weavers as a means of relief from poverty, unemployment, adulterated food, and extortionate prices, the cooperative movement has remained a distinctly working-class movement, and as such has spread to every continent. The United States was one of the first countries to follow the lead of the Rochdale pioneers. Until recently, however, the cooperative movement has not been particularly successful here, though thousands of enterprises have been started which have had temporary success.

The cooperative spirit in the United States has manifested itself in various ways. Probably the first instance of cooperative purchase was the buying club established in Boston in 1844, out of which grew the powerful New England Protective Union. This organization flourished for a while, but internal quarrels disrupted it, and its place was taken by the American Protective Union. Through the latter, as many as 700 stores are said to have been established in New England.

During the early seventies the Patrons of Husbandry, a farmers' order, established a number of cooperative stores, some of which still exist.

The establishment of communistic colonies was another form taken by cooperative effort. This phase, beginning early in the first half of the century has continued, in sporadic instances, up to the present. Some of these colonies, such as the Amana community in Iowa, the Separatist community at Zoar, Ohio, and the various Shaker communities, were primarily religious. Others, such as the Anaheim and Kaweah cooperative colonies in California were economic in origin. Some of these communities are still in existence. The Oneida community in New York, which began as a communistic religious colony, still survives, but has taken on the character of a joint stock company.

Not all of the early ventures were strictly cooperative in principle and in many cases the cooperative idea was subordinated to some other economic or social theory which caused the failure of the cooperative scheme. This was true of the movement supported by the Knights of Labor about 1884, in which the cooperative feature was incidental to their political program, the failure of which destroyed the stores.

¹ The data on which this section is based were secured from *Consumers' Cooperation*, by Albert Sonnichsen, *Cooperation in New England*, by Prof. James Ford, and U. S. Bureau of Labor Bulletin No. 35.

In 1874 there was established a purely cooperative organization, the Sovereigns of Industry. Stores established by this organization spread all through the North Atlantic coast States. This society failed in 1879 through bad business management.

Toward the end of the century the movement in the United States seemed to have died out. Only a few isolated independent stores remained. Of recent years interest in all lines of cooperative activity, particularly in farmers' marketing organizations and cooperative buying associations, has gradually revived. The most notable examples of the former type of cooperation are found in such associations as the California Fruit Growers' Exchange and the various live-stock shippers' organizations. A detailed discussion of farmers' distributive organizations was given in the MONTHLY LABOR REVIEW for March, 1919 (pp.133-136). The present article will be confined to cooperative buying or consumers' associations.

There are now certain well-defined centers of consumers' cooperative associations. The Pacific coast has a vigorous movement, strongly backed by labor unions, centering about San Francisco and Seattle. Illinois is another center of cooperative activity. In this section the miners have been largely instrumental in making the stores a success. In the Dakotas, the Nonpartisan League has established a chain of stores as a part of its program. The North Central States have a thriving movement centering in the Cooperative Wholesale Society of America, in St. Paul, which combines both the producer and consumer phases of the movement. A good deal of organization work is being done in the vicinity of New York City. The Finns have a large number of stores, all strongly centralized, with wholesale centers at Superior, Wis., and Fitchburg, Mass.

Extent and Character of Cooperative Movement in the United States.

WHILE there seem to be no statistical data relative to the extent of the cooperative movement in the United States, it is estimated that there are about 3,000 consumers' societies, having a combined business of approximately \$200,000,000 a year.¹

The Bureau of Labor Statistics has been making a tentative survey of the cooperative movement and now has data from about 85 consumers' cooperative societies. Though as yet the data are too scattered and incomplete and relate to too small a number of associations to be put into statistical form, they will serve to give a general idea of the character of the cooperative society. The survey includes associations dealing in one or several of the following lines: Groceries, meats, meat products, bakery goods, milk, dry goods, women's clothing, millinery, boots and shoes, students' school sup-

¹ Estimated by the National Cooperative Association, Chicago.

plies, feed, fuel, miners' supplies, grain, fertilizers, spraying materials, lumber, timber products, farm machinery, and hardware.

All except six of the societies reporting as to number of establishments operate only one establishment. Of these, four report that they operate a branch store in connection with a grocery or general mercantile business; one society which does a general mercantile business operates seven branch stores; a Finnish society in New England reports that it operates 12 grocery stores, 2 bakeries, 3 boarding places, and 4 milk stations.

Membership.

The membership of the societies which furnished information as to membership ranged from 35 to 1,700, the average being 427. Most of the societies reporting conform to the open-membership principle. Generally the only requirement—aside from the monetary one—is that the applicant be over 16, or over 18, years of age, or that he be indorsed by a member in good standing. One society makes a somewhat unusual restriction on membership. Its constitution provides that "members of commercial clubs, employers' organizations, manufacturers' associations, retailers' associations, and business men, private detectives, except should they be a member of some labor organization also," shall not be admitted to membership in the society.

Most societies charge a small membership fee ranging, among those reporting, from 25 cents to \$1. In one society this fee was \$5; two others charge \$10.

Number and Value of Shares.

The value of a share of stock ranges from \$5 to \$100, the greatest number reporting the former amount. The significance of this is altered somewhat by the fact that some societies require the purchase of more than one share of stock by each member. With this factor taken into account the capital investment required ranges from \$5 to \$300, the majority of societies requiring \$10. The average for all the societies reporting was \$41 per member. Of course, every factor which tends to increase the amount of money which must be advanced in order to secure membership limits the field from which the society may draw its members, since many persons, though interested in the project, might still be deterred by financial inability from joining. One society whose shares are \$100 each requires that each member hold three. To the average wage earner whom the cooperative movement should benefit this requirement acts as a very effective barrier. About one-fourth of the societies reporting stated that the shares may be paid for in installments.

The number of shares that may be held by one member range from 1 to 200, the greatest number of associations allowing each member

to own 5 shares. The maximum amount that may be invested by any one member ranges from \$10 to \$1,000. In the largest number of cases a member may invest \$100 in share capital. The number of shares per member is limited in some States by the cooperative law. Thus, in Illinois the law provides that no member may own more than five shares or \$500 worth of stock.

Democracy in Government.

Without exception, in the societies studied, the principle of "one member, one vote" is strictly adhered to. Voting by proxy is allowed in only one society. A number of associations allow a member unavoidably absent to vote by mail, provided he is informed as to the matter to be voted on. A great many allow the member's vote to be cast, in his absence, by a member of his family.

Since democracy in government is one of the chief principles of the cooperative society, it is important that as many members participate as possible, and cooperators lay stress on the importance of members' attendance at meetings. About one-third of the societies reporting levy a fine, ranging from 25 cents to \$1, for nonattendance, and one society provides that any member failing, for a whole year, to attend the meetings shall be expelled.

The affairs of each society are managed by a board of directors elected by and from the membership to serve, in the majority of cases, for one year. This board usually consists of five or seven members. In one case, where there are nine directors, the constitution provides that three shall be women. Another association provides that none of its directorships shall be filled by a "business man or profiteer."

Prices.

Of the associations which reported as to prices, all but three sell at prevailing prices. These three state that they sell at "reasonable rates," "operate on a small margin," or on as small a margin "as is consistent with safety."

Sales.

Though it is the policy of the stores reporting to sell only for cash, in practice members are allowed credit to the amount of from two-fifths to four-fifths of their paid-up capital stock. Three-fifths of the paid-up capital stock seems to be the usual amount of credit granted. Usually, in addition, credit is given to the full amount of the member's loan capital. One society, which allows credit up to four-fifths of stock, states that it does not recommend this as a safe course to pursue, although it has worked very well in their case. One association allows credit, amount unspecified, for six months; another allows it to the amount of \$40, and this must be paid by the tenth of the following month.

The average monthly sales of the societies reporting on this point range from \$2,359 in one small society which had at the time of reporting been in business less than a year to \$78,450 in a society having about 1,700 members, which has been established since 1890. The average sales of all the societies reporting amounted to \$13,315 per month. This average is probably too large to be representative of the typical small cooperative society, since the societies which reported on this point were, for the most part, societies with a large membership and some operated more than one store.

Rates of Interest, Provision for Reserve, etc., and Dividends on Purchases.

The rate of interest paid by the societies reporting ranged from nothing, in two cases, to 10, in one case. In only one instance, a Michigan society, was more than the legal rate of interest paid. In several of the societies, the first two or three shares of each member's stock are held as working capital and bear no interest, the legal rate being paid on all shares in excess of those numbers.

Practically every society provides for a reserve fund to meet unexpected losses. The amount annually set aside for this fund is based upon the surplus, and ranges from 1 to 50 per cent. In most of the societies the annual appropriation for reserve is 10 per cent or under. Many societies provide either that when the reserve reaches the sum of \$30,000, or when it amounts to 30 per cent of the capital stock, no further additions to the fund shall be made.

In the cooperative movement, emphasis is laid on the importance of educational and propaganda work, and many associations regularly appropriate a certain percentage of the surplus for this purpose. In the societies studied this percentage ranged from 2 to 50 per cent.

Cooperative societies generally sell to nonmembers as well as members, but they do not always include nonmembers in the return of dividends. Where dividends are returned on the purchases of nonmembers they are usually at one-half the rate received by members, though some of the societies state that they pay up to three-fourths of the members' rate. In some associations the nonmember's dividend is not paid to him but is applied on a share of stock so that in time he automatically becomes a member of the society and is entitled to the full rate of dividend.

Some societies also arrange with private stores for a discount on purchases made by their members.

Benefits of the Cooperative Society.

The cooperative stores probably have little, if any, effect in lowering prices in their community, since, as has been noted, most of them sell at prevailing market prices to avoid arousing the enmity of the private dealer. The practical effect of price reduction, however, is

obtained by means of dividends, which are declared quarterly or semiannually.

The dividend is the member's share of the "profits," that is, of the sum remaining after deduction from the surplus of the amounts to be set aside for education, reserve, and depreciation funds. The dividend is computed not upon the capital stock but upon the total sales, and is distributed in accordance with the amount purchased by each member. Thus the member whose purchases at the store have amounted to \$100 during the quarter would receive, on a 6 per cent dividend, \$6.

The dividends returned to members on purchases ranged from 3 to 10 per cent. One large society, mentioned above, states that it has never paid less than 8 per cent and has paid as high as 13 per cent. The average dividend for the stores reporting was a little over 7 per cent.

Only three of the stores reporting as to the amount of dividend deal exclusively in groceries. These reported dividend returns of 4, 6, and 9 per cent on purchases. In the investigation made by the Bureau of Labor Statistics in cooperation with the National War Labor Board of the cost of living in 92 industrial centers it was found that the average annual expenditure for food of 3,959 families with yearly incomes of \$1,200 and under \$1,500, amounted to \$515.55.¹ On such an expenditure the cooperator would receive as his yearly dividend \$20.62 from the store paying a 4 per cent dividend, \$30.33 from the one paying 6 per cent, and \$46.40 from the one paying 9 per cent. The expenditure for food of 2,730 families with yearly incomes of \$1,500 and under \$1,800 was found to be \$571.75.¹ On purchases to this amount the dividend received from the three stores would be \$22.87, \$34.30, and \$51.46.

It must be borne in mind, however, that probably in most cases members would not buy all of their food supplies from the cooperative store. The above dividends, therefore, are the maximum receivable, the amount actually received being determined by the proportion bought at the cooperative store.

The average dividend paid by the societies dealing in general merchandise ranged from 3 to 8 per cent, the average being 6 per cent. Assuming the term "general merchandise" to cover the items listed by the Bureau in its cost-of-living study as "food," "clothing," and "furniture and furnishings," the average expenditure for general merchandise of the industrial wage earners' families was found to be \$784 for those having an annual income of \$1,200 and under \$1,500 and \$907.44 for those having an income of \$1,500 and under \$1,800. At the rate of a 6 per cent return on this expenditure, assuming

¹ MONTHLY LABOR REVIEW, August, 1919, p. 118.

again that all purchases for merchandise were made at the society's store, the yearly dividend would amount to \$47.04 and \$54.45.

Besides this monetary benefit the cooperator receives other advantages through his membership in the society. Prof. Ford emphasizes¹ that the cooperative movement provides values not readily obtainable from other sources:

(1) It provides important practical education in business methods for adult wage earners. (2) It provides training for citizenship. Questions of broad policy are inevitably discussed in meetings of cooperative associations. This discussion develops knowledge, ability to understand and to handle men which renders the cooperator valuable in public service. (3) It discovers what Prof. Marshall calls "our greatest waste product," namely, the latent abilities of workingmen, and utilizes those latent abilities not only in the fields of business and citizenship, but throughout the entire range of social conduct. (4) It habituates men to altruistic modes of thought and of conduct. The motto "Each for all and all for each" finds daily expression in cooperative activities. The more a man buys from the cooperative shop the more he stabilizes the business and increases his profits and his neighbor's dividends. (5) It not only increases the income of individual members, but creates a collective capital which can be used on occasion to free the working classes from any form of exploitation.

¹ Distributive cooperation, by James Ford. Address delivered at National Conference of Social Work, 1917, Pittsburgh, Pa.

EMPLOYMENT AND UNEMPLOYMENT.

Employment in Selected Industries in January, 1920.

THE Bureau of Labor Statistics received and tabulated reports concerning the volume of employment in January, 1920, from representative establishments in 13 manufacturing industries. Comparing the figures of January, 1920, with those of identical establishments for January, 1919, it appears that in 10 industries there was an increase in the number of persons employed, while in 3 there was a decrease. The greatest increases—54.2 and 51 per cent—appear in men's ready-made clothing and woolen, respectively, and the largest decrease—24.9 per cent—is shown in car building and repairing.

Eleven of the 13 industries show an increase in the total amount of the pay roll for January, 1920, as compared with January, 1919, and 2 show a decrease. The most important percentage increases—149.5, 125.8, and 73—appear in men's ready-made clothing, woolen, and automobile manufacturing, respectively. A decrease of 21.5 per cent is found in car building and repairing.

The large increases over last year are due in part to the decline in the fall and winter of 1918-19 caused by the cancellation of Government contracts and uncertain industrial conditions following the signing of the armistice in November, 1918. In men's ready-made clothing in November, 1918, there was a falling off of 1.4 per cent in the number of employees and 4.6 per cent in the amount of the pay roll as compared with October, 1918. The comparison of December, 1918, with November, 1918, shows a decrease of 2.7 per cent in the number of employees and an increase of 5.8 per cent in earnings. In January, 1919, as compared with December, 1918, there was a decrease of 8 per cent in the number on the pay roll and a decrease of 3.7 per cent in the amount of the pay roll. In woolen for January, 1919, as compared with December, 1918, there was a falling off of 18.1 per cent in the number on the pay roll and 25.2 per cent in the amount of the pay roll.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN JANUARY, 1919,
AND JANUARY, 1920.

Woolen.	49	1 week..	29,123	43,975	+51.0	507,706	1,146,242	+125.8

Comparative data for January, 1920, and December, 1919, appear in the following table. The figures show that in nine industries there was an increase in the number of persons on the pay roll in January as compared with December, and in four a decrease.

The largest increase in the number of people employed appears in iron and steel, 12.4 per cent. Decreases of 3.4 and 2.6 per cent are shown in cigar manufacturing and car building and repairing, respectively.

In comparing January, 1920, with December, 1919, nine industries show an increase in the amount of money paid to employees and four a decrease. The most important increases are 13.7 per cent in iron and steel and 12.4 per cent in automobile manufacturing. Cigar manufacturing and car building and repairing show respective percentage decreases of 7.8 and 6.4.

Woolen.	49	1 week..	45,553	47,407	+ 4.1	1,181,265	1,227,862	+ 3.7

In addition to the data presented in the above tables as to the number of employees on the pay roll 86 plants in the iron and steel industry reported 147,426 employees as actually working on the last full day of the pay period reported for January 1920, as against 156,327 for the reported pay-roll period in January, 1919, a decrease of 5.7 per cent. Figures given by 87 establishments in the iron and steel industry for January, 1920, and December, 1919, show that 147,893 employees were actually working on the last full day of the pay period reported for in January, 1920, as against 131,054 for the period in December, 1919, an increase of 12.8 per cent.

Changes in Wage Rates.

DURING the period December 15, 1919, to January 15, 1920, there were establishments in 11 of the 13 industries which reported increases in wage rates. Of the establishments reporting, many did not answer the inquiry relative to this item, but in such cases it is not likely that changes were made.

Automobile manufacturing: Twenty per cent of the employees in one establishment received an increase of 10 per cent, and 9.5 per cent of the men in another plant received an increase of 8.25 per cent. One concern granted a 4 per cent increase to 12½ per cent of their help. In one establishment 40.6 per cent of the employees received an increase of 2.48 per cent, while 5 per cent of the force in another shop were granted a wage increase of 2 per cent. Two establishments reported a few individual increases but made no further statement.

Boots and shoes: Ten per cent of the employees in one firm were granted a 12½ per cent increase. Three firms gave increases of 10 per cent affecting all of the force in two plants and 25 per cent of the men in the third establishment. An increase of 9¾ per cent, affecting 16⅔ per cent of the employees, was reported by one plant. One establishment gave an 8 per cent increase to 10 per cent of their help and paid 20 per cent of the men a bonus of 7½ per cent on wages earned the preceding three months. A few small individual increases were reported by one concern but no further data were given.

Cigar manufacturing: One factory reported a 12 per cent increase but made no further statement. One establishment gave increases ranging from 5 to 10 per cent to 98 per cent of the employees. All of the men in one concern received an increase of 7½ per cent. An increase of about 2 per cent, affecting 4½ per cent of the force, was reported by one concern.

Men's ready-made clothing: Five establishments granted a 20 per cent increase affecting all of the employees in three firms, 90 per cent of the force in the third plant and 75 per cent of the men in the

fourth concern. An increase of 17 per cent, affecting $82\frac{1}{2}$ per cent of the employees, was given by one establishment. All of the employees in one concern were given an increase of 15 per cent and the entire force of another establishment received increases ranging from 10 to 15 per cent. One firm reported an increase of 9.71 per cent but made no statement concerning the number of men affected.

Cotton finishing: An increase of $12\frac{1}{2}$ per cent, affecting all of the employees, was reported by one establishment while another concern gave a 2 per cent increase to all of their force.

Cotton manufacturing: One establishment reported a 16 per cent increase but made no statement as to the number of men affected. All of the employees in three plants received a 10 per cent increase and the entire force in another plant was granted an increase of 9.1 per cent. One concern reported an increase of $8\frac{1}{3}$ per cent, affecting 99 per cent of the help.

Hosiery and underwear: One establishment granted an increase of 15 per cent to all of the employees. Two firms gave a $12\frac{1}{2}$ per cent increase to the entire force, and two other mills reported a $12\frac{1}{2}$ per cent increase in wage rates but failed to give the proportion of the help affected. An increase of 11 per cent, affecting all of the men, was given by three concerns. All of the employees in one mill received an increase of about 10 per cent while six establishments granted 10 per cent increases, affecting all of the men in four plants, 90 per cent of the employees in the fifth mill, and 25 per cent of the force in the sixth establishment. One concern reported an increase in wage rates but made no further statement.

Iron and steel: One plant reported individual increases of about 10 per cent. Fifty per cent of the men in one establishment received increases ranging from 2 to 10 per cent, and all of the employees in another plant were granted a $6\frac{1}{4}$ per cent increase. One concern reported an increase of about 6 per cent affecting 60 per cent of the force and a $2\frac{1}{2}$ per cent increase to the other 40 per cent of the employees. The entire force in one mill was granted a 5 per cent increase. All of the men in one mill received an average wage increase of $4\frac{1}{2}$ per cent. Two plants reported a $2\frac{1}{2}$ per cent increase, affecting about 20 per cent of the employees in one concern and one-third of the force in the other. Forty-two per cent of the employees in one establishment received an increase, the puddle mill tonnage men receiving an increase of 2.2 per cent and the finishing mill tonnage men a 1.2 per cent increase. All of the force in one plant was granted an increase of 0.1428 per cent, and the wages of all the employees in another concern were increased 30 cents per day. One establishment reported an increase of 0.0233 per cent, affecting 75 per cent of the force, and 41 per cent of the men in another plant.

received an increase of 0.019 per cent. One establishment reported an increase but made no further statement.

Leather manufacturing: Six per cent of the men in one establishment received a 15 per cent increase. One firm gave a 10 per cent increase to all of the employees while the entire force in another plant was granted an increase of $7\frac{1}{2}$ per cent. A 5 per cent increase, affecting 50 per cent of the men, was reported by one concern. One establishment paid a bonus to all full-time workers.

Paper making: Eighty-five per cent of the employees in one establishment received an increase of $12\frac{1}{2}$ per cent. Two firms gave a 10 per cent increase affecting the entire force and all of the men in another concern were given an increase of approximately 10 per cent.

Silk: One establishment reported an increase of about 20 per cent affecting about one-half of the employees. All of the force in one mill was given a $12\frac{1}{2}$ per cent increase. Seven concerns granted an increase of 10 per cent, affecting all of the men in the first two plants, 90 per cent of the force in the third, 79 per cent in the fourth, 50 per cent in the fifth, 7 per cent in the sixth, and 3 per cent in the seventh. One concern gave a 5 per cent increase to 20 per cent of the employees, and another firm paid a 5 per cent bonus to the entire force. An increase was reported by one mill but no further information was given.

Employment and Unemployment in Great Britain in 1919.

A REVIEW of employment and unemployment conditions in Great Britain in 1919 is contained in the January issue of the British Labor Gazette. It is stated that in the early part of 1919 there was a large amount of transitional unemployment due to changing over from war to peace conditions, which was most severely felt by semiskilled and unskilled munition workers, large numbers of whom had been drawn from other industries, while many others—particularly women—have not previously been occupied in wage-earning employments. For most classes of skilled workers employment remained fairly good. While not an exact measure of the volume of unemployment, the out-of-work donation statistics give a fairly accurate index to conditions, showing the improvement which took place in the spring and summer. From the beginning of the year until early in March the number of those in receipt of out-of-work donations increased from 625,149 civilians and 53,554 ex-service men, to 753,982 civilians and 306,263 ex-service men. An improvement then set in among civilians, the number of policies

current decreasing to 137,637 on November 21, three days before the termination of the civilian donation. However, the number of ex-service men out of employment continued to increase until the maximum of 409,959 was reached on May 9. A steady decrease then set in continuing until September, when the number was 302,272. In October the number increased to 344,242 in November to 353,909, and on January 2, 1920 had reached 383,095.

The great amount of unemployment among women in the early months of the year may be illustrated by analyzing the figures for March 7, the date of maximum civilian unemployment. On that date the number of persons recorded as unemployed in connection with the donation scheme for civilians was 790,521, of whom 234,402 were men, 27,356 boys, 494,365 women, and 34,398 girls. The maximum of unemployment as regards ex-members of H. M. Forces was May 9, when the figures reached 409,959.

It is stated that the percentage of unemployment among members of trade-unions paying unemployment benefits was highest in December, being 3.2 per cent, the mean for the year being 2.4 per cent, and that this mean was the highest since 1914 when it was 3.3 per cent. It was, however, less than the average in prewar years—from 1905 to 1914. It is explained in this connection that skilled men permanently engaged in their trades form a relatively large proportion of the members of these trade-unions, and that the unemployment in the early part of 1919 was largely unemployment of semiskilled and unskilled workers who were discharged from industries which they had only entered for the purposes of the war. These figures, therefore, may not fully indicate the amount of unemployment occurring under such abnormal circumstances as prevailed in the first half of 1919. They also take no account of short time.

Employment and Unemployment Conditions in France.¹

THE first industrial census taken of the invaded districts of France was made by the Office of Industrial Rehabilitation as of July 1, 1919. Questionnaires were sent to establishments which under normal conditions employed 20 or more persons each. From two departments only (Nord and Ardennes) were returns received which furnished sufficient data for the purposes of the investigation. Of these questionnaires, 1,045 and 201 were returned from the two departments named, and 276 from other departments. Of the establishments returning these questionnaires, 706, or 46.3 per cent, have resumed operations. The number of persons employed in

¹ Bulletin du Ministère du Travail. Paris, June-July-August, 1919, pp. 273-278 and 310-313.

industrial labor in these establishments in 1914 was 397,140, and in 1919, 38,682, or 9.7 per cent. There were also 53,419 civilian workers and 13,276 war prisoners engaged in clearing away débris and in reconstruction work, making a total of 105,377 persons employed.

The following table shows the industrial situation as to employment, July 1, 1919, as compared with 1914:

NUMBER OF ESTABLISHMENTS EMPLOYING 20 OR MORE PERSONS, AND NUMBER OF CIVILIAN WORKERS EMPLOYED IN THEM, 1914 AND JULY 1, 1919.

Industry.	Establishments.			Number of civilian workers employed.				Per cent of employees in 1914 in industry on July 1, 1919.

Total.....	1,522	706	46.3	397,140	53,419	38,682	92,101	9.7

¹ Computed; not shown in original table taken from the report.

² Not shown in report.

Of the total civilian workers engaged in removing débris and in repair work 14,410 were foreign workmen, nearly all of whom were Belgians. These foreign workmen formed 15.6 per cent of the total number of workers employed in both reconstruction and industrial work. The number of wounded and invalided soldiers employed formed but a small portion, 1,036.

City of Paris.

BASED on a recent report on the operation of the municipal unemployment fund of Paris, published in the Bulletin of the French Ministry of Labor, unemployment in the city of Paris continues to decrease. The report states that the number of persons in receipt of benefits decreased from 67,370 during the period April 30 to May 15, 1919, to 29,629 in the two weeks ending August 19; that in the same periods, respectively, the amount of the unemployment benefits paid fell from 2,990,245 francs ¹ to 1,324,363 francs. The amount of State aid granted the fund was 1,828,127

¹ Owing to fluctuations in the value of the franc, conversions in this article are not made into United States money. Normally, the par value of the franc is 19.3 cents.

francs in the former period, but it was reduced to 808,962 francs in the two-week period ending August 19.

Comparing the average number of persons in receipt of benefits in the period April 27 to August 16, 1918, with the period April 30 to August 19, 1919, the report shows that there were more than four times as many in receipt of unemployment benefits in 1919 as in 1918 and that the disbursements increased from 1,315,386 francs in 1918 to 14,379,095 francs in 1919, or about 993 per cent.

The following table presents comparative figures for corresponding periods of 1918 and 1919:

NUMBER OF UNEMPLOYED PERSONS RECEIVING BENEFITS, TOTAL DISBURSEMENTS AND STATE AID TO UNEMPLOYMENT BENEFIT FUNDS, IN SPECIFIED PERIODS OF 1918 AND 1919.

Item.	Apr. 27 to Aug. 16, 1918.	Apr. 30 to Aug. 19, 1919.	Per cent of in- crease.
Average number of unemployed receiving benefits.....	11,258	46,025	308.81
Men.....	1,872	27,186	1,352.24
Women.....	9,386	18,839	100.71
	<i>Francs.</i>	<i>Francs.</i>	<i>Francs</i>
Total disbursements.....	1,315,386	14,379,095	993.14
State aid.....	433,374	8,777,749	1,925.44
Expense to city of Paris.....	882,012	5,601,346	535.06

During the first period the State paid 33 per cent of the total disbursements for unemployment grants. On January 15, 1919, the State assumed 75 per cent, which has considerably changed the ratio of distribution for the two periods.

The following table shows the extent of unemployment by industries for the two periods August 1 to 16, 1918, and August 4 to 19, 1919.

NUMBER OF PERSONS, BY INDUSTRY AND SEX, RECEIVING UNEMPLOYMENT BENEFITS, IN PARIS, AUGUST 1 TO 16, 1918, AND AUGUST 4 TO 19, 1919.

¹ Decrease.

² This total is taken from the original report. The total of the column is 8,803.

It is stated that the increase in 1919 was due to demobilization. It is shown that unemployment has been steadily growing less during the year.

The labor exchanges (*commissions paritaires*) have canceled the names of a large number of persons appearing on the roll as beneficiaries and have endeavored to find employment for them. Of the total receiving benefits—namely, 322,180—the number thus dropped by the commissions, in the period April 30 to August 19, 1919, was 63,424, and the number who secured employment was approximately one-half of the number dropped—36,093 or 56.9 per cent. The number of beneficiaries dropped from the roll by reason of their having secured employment was 11.2 per cent of the total number receiving benefits.

Unemployment in Germany.

ACCORDING to the *Kölnische Zeitung*¹ the *Reichs-Arbeitsblatt* reports that unemployment increased in Germany during November, 1919. Reports received by the German Statistical Office from 31 trade-union federations, with a membership of 4,538,921, show that in that month 131,193 members, or 2.9 per cent, were unemployed. In October, 1919, 32 federations reported 110,626 (2.6 per cent) members as out of work, and in November, 1918, 31 federations reported 26,144 (1.8 per cent) members unemployed. The greatest increase of unemployment was reported by the building trades unions, 4.7 per cent against 1.9 per cent in October. The textile workers' federation, on the other hand, reported a decrease of unemployment from 7.4 per cent in October to 6.5 per cent in November, and the transport workers' federation a decrease from 2.6 to 1.1 per cent, respectively. The number of persons receiving unemployment grants on December 1, 1919, was 388,300 (291,501 males and 96,799 females). Statistics of the employment offices show that for every 100 vacant situations there were 173 male and 129 female applicants, as against 150 and 115 in October, 1919, and 74 and 101 in November, 1918.

Conditions in the Baking Industry.

AN ARTICLE in *Soziale Praxis*² calls attention to the superabundance of apprentices in the German baking industry at the present time. In 28,745 baking establishments there are 19,625 journeymen and 21,831 apprentices, i. e., 111 of the latter to each 100 of the former, whereas in 1909 the respective proportion was 44 to 100. Employers are apt to encourage the taking on of apprentices, since they are able

¹ *Kölnische Zeitung*, Cologne, Dec. 29, 1919.

² *Soziale Praxis und Archiv für Volkswohlfahrt*, Berlin, Dec. 23, 1919.

to make a larger profit on their labor. The result has been a large increase of unemployment in the industry, which has caused many qualified bakers and confectioners to seek work in other industries. According to the *Reichs-Arbeitsblatt*, 12,543 bakers and confectioners were out of work in September last. This led to the workers' organizations insisting in the case of all wage scale agreements that clauses should be inserted limiting the number of apprentices. Employers who will not employ journeymen, but accept apprentices with a view to making increased profits are not to be allowed to take apprentices in future. The employers are, however, opposed to such clauses since they see in the apprentice system an opportunity of enriching themselves, for the employment of apprentices reduces their outlay for wages.

Unemployment in the Hotel and Restaurant Industry.

ACCORDING to *Soziale Praxis* (December 20, 1919), there is no industry in which unemployment is more rife than in the hotel and restaurant industry. Various measures are being adopted to combat this unsatisfactory state of affairs. In Berlin so-called compulsory holidays for hotel employees have been instituted, every employee who has occupied his present situation for six months being obliged to take a week's leave between July and December. In Nuremberg, with the assent of the conciliation board, it has been ordered that waiters and waitresses engaged during the war must be laid off for three months and replaced by unemployed and prisoners of war who have returned home. In Hamburg it has been ordered that every married waiter should receive 700 marks per month (basic wage and percentages), and every unmarried waiter 550 marks. In cases where the percentages exceed these amounts an extra waiter is to be employed for each 700 or 550 marks.

WOMEN IN INDUSTRY.

Annual Report of Women's Service Section, United States Railroad Administration.

AN ACCOUNT was given in the MONTHLY LABOR REVIEW, March, 1919 (pp. 209-212), of the establishment and work of the Women's Service Section, having charge of the wages and working conditions of women employed by the railroads of the country. The annual report of the Director General of Railroads devotes a section to the work of this division during the past year.¹

The work of the women's section has been particularly devoted to improving working conditions, especially in regard to health, comfort, and proper hours of work, and to insuring a fair application of the wage orders so that there should be no discrimination against the women.

The highest point in the employment of women was reached in October, 1918, when there were 101,785 employed by first-class roads, an increase of 66 per cent in the first nine months of 1918, and of 225 per cent from the beginning of the war. Although this number has decreased since that time, there are still many more employed than before the war. There are two causes which have operated to bring about the reduction in the number of women employees: First, the return of soldiers and sailors, who were reinstated according to seniority, and second, the general reduction in labor force on the railroads caused by the necessity for economy and which resulted in women being laid off in many cases because of their lower seniority rights. Recently, however, there has again been a slight increase in the number of women employed.

The eight-hour day has been put into effect in an increasing number of cases. Out of a total of 12,908 women covered by inspections of the women's service section, working in all classes of work, 90 per cent were working 48 hours or less in 1919, as against 70 per cent in 1918. Improvement in the number employed on night work, that is, employment on shifts beginning or ending between 6 p. m. and 6 a. m., is also noted, there being but 4.2 per cent of the total number working at night. These were mainly telephone switchboard operators in private exchanges and clerks. But 8 per cent of the total number scheduled, mainly car cleaners, were employed 7 days per week.

¹ Annual report of Walker D. Hines, Director General of Railroads, 1919, Division of Labor. Washington, 1920, 84 pp.

Beginning last October, however, seven days' work is allowed only every other week.

Much progress also is reported in improving working conditions, especially in the provision of rest rooms which can be used at need as lunch rooms, dressing rooms, or for first-aid. The best results, it is said, have been achieved where a special supervisor of women employees has been installed and during the past year and a half, nine of the roads, most of them large systems, have engaged women supervisors.

Wage increases have been effective for women as well as men. The following table shows the rates of pay for clerical workers:

RATES OF PAY PER MONTH FOR WOMEN EMPLOYED AS CLERICAL WORKERS.

Item.	Employees whose rates of pay per month are—										Total.
	\$45 and under \$50	\$50 and under \$60	\$60 and under \$70	\$70 and under \$87.50	\$87.50 and under \$95	\$95 and under \$105	\$105 and under \$115	\$115 and under \$125	\$125 and under \$135	\$135 and over

¹ At \$69.

The lowest rates of pay are found among the laundresses and seamstresses, whose rates correspond closely with commercial rates. In general, however, railroad work has been very popular with women because of the prevailingly high wages as compared with pay in other positions. The standardization of rates has been carried to such an

extent that the "rate is put on the position and not on the person," with the result that the women have been put to a real test of capacity. That they have not always measured up to the standard, it is stated, is because during the war emergency there was not time to make careful selection and many had to be taken in with insufficient training.

In regard to the future possibilities of advancement toward the more responsible positions in the railroad industry, the writer of the report says:

Testimony from their superiors indicates that women will undoubtedly progress further in all forms of work. While in some offices there is hesitation in encouraging them to advance into the more responsible positions, in other offices there is distinct effort to put no obstacle in their path, in fact they are being urged to bid on the higher positions. While some officials are still testing out the capacities of their women employees, others are emphasizing the need of training as the only requisite for further advancement.

INDUSTRIAL ACCIDENTS.

Accidents on Steam Railroads in the United States in 1918.¹

STATISTICS of accidents on steam railroads in the United States in 1918 are presented by the Interstate Commerce Commission in its Accident Bulletin No. 70, recently issued. The commission's rules governing monthly reports of railway accidents divide accidents into three primary groups, namely: Train accidents, train-service accidents, and nontrain accidents. The commission defines train accidents as those arising in connection with the operation of trains, locomotives, or cars in road, yard, or work service, resulting in damage to equipment or other railway property.

Train-service accidents are defined as those, incidental to the operation of trains, locomotives, or cars, which result in casualties to persons but not in damage to equipment or other railway property. They include casualties due to coupling or uncoupling cars or car connections; to getting on or off, falling from, being struck by, or doing work about trains, locomotives, or cars not in shops or engine houses; to coming in contact, while on or getting on or off moving cars or locomotives, with any fixed structure above or at the side of track; and other like accidents not causing damage to the train itself or to other railway property.

Nontrain accidents include those occurring in and around shops, on boats and wharves, at stations, freight houses, engine houses, coaling stations, water stations, tracks, etc.; also those occurring in connection with construction or with repair, painting, or other maintenance work on buildings and other structures, and with the construction and maintenance of equipment, except such running repairs as may be made by trainmen en route. They do not include accidents occurring directly in connection with the operation of trains, locomotives, and cars, on rails.

In reports of injuries to persons the commission prescribes the following distinctions:

1. Any person killed in an accident at the time of its occurrence, or so severely injured as to die within 24 hours thereafter, should be reported as "killed."

¹ United States. Interstate Commerce Commission. Bureau of Statistics. Collisions, derailments, and other accidents resulting in injury to persons, equipment, or roadbed, arising from the operation of railways used in interstate commerce. October, November, and December and year 1918. Washington, 1920. 64 pp. Accident Bulletin No. 70.

2. With regard to injuries not resulting in death within 24 hours after the occurrence of an accident, the following rules are to be observed: (a) Employees incapacitated from performing their ordinary duties for more than three days, in the aggregate, during the 10 days immediately following the accident, are to be reported as "injured;" those incapacitated for only three days or less are not to be reported; (b) persons other than employees are to be reported as "injured" if the injury is sufficient, in the opinion of the officer making the report, to incapacitate the injured person for a period of more than one day from following his customary vocation.

The rules further provide that only accidents arising from the operation of a railway which cause either the death or the injury of a person as limited above or cause damage to railway property in excess of \$150 (including cost of clearing wreck) are reportable.

In the interest of uniformity, it is unfortunate that the rules noted above do not conform to those laid down by the committee on insurance and compensation insurance cost of the International Association of Industrial Accident Boards and Commissions,¹ which prescribe certain standard definitions applicable to the reporting of industrial accidents. For example, any person who dies as the result of injuries should be reported as killed even though death occurred after an interval of 24 hours from the time of the accident. Also, the committee prescribes that all accidents and injuries arising out of the employment and resulting in death, permanent disability, or in the loss of time other than the remainder of the day, shift, or turn on which the injury was incurred, should be reported. In the definition above it will be noted that employees incapacitated three days or less are not to be reported. Section (b) in the definitions of the Interstate Commerce Commission is very indefinite, and increases the confusion by establishing a different standard for injuries to employees and to other persons.

The following table is a summary of the accidents reported for the calendar year 1918:

CASUALTIES TO PERSONS ON STEAM ROADS IN THE UNITED STATES FOR THE YEAR ENDED DECEMBER 31, 1918.

Class.	Passengers and persons carried under contract.		Employees, including those not on duty.		Other persons (trespassers and nontrespassers).		Total.	
	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.

¹ See MONTHLY REVIEW for October, 1917, for report of this committee.

INDUSTRIAL HYGIENE AND MEDICINE.

Health Hazards in Certain Industries of New York State.

Industries of Niagara Falls.

HEALTH hazards in the industries of Niagara Falls is the title given to the description by Paul M. Holmes, in a recent number of Public Health Reports,¹ of the results of an investigation conducted by the United States Public Health Service. The investigation was brought about by a letter from the secretary of the employers' association of Niagara Falls to the Commissioner of Labor Statistics, United States Department of Labor, dated June 27, 1918, asking permission of the Federal Government to introduce women into "shift work," which, as it involved working between the hours of 10 p. m. and 6 a. m., was prohibited by the New York State law. The request was referred by the Commissioner of Labor Statistics to the newly created Woman in Industry Service of the Department of Labor, and the Service decided to associate with it in the work other Federal agencies. A committee on hazardous occupations was formed, with a membership representing Federal agencies concerned with women in industry and with the health of the civilian population, federal departments having a direct or indirect interest in contracts in the chemical industries, and the New York State Department of Labor. This committee decided that a field investigation was necessary and appointed a subcommittee which supervised the field work and met at frequent intervals with a consultant staff, which was composed of Dr. Alice Hamilton, of the Bureau of Labor Statistics, Prof. C. E. A. Winslow, Dr. David Edsall, and Dr. W. Gilman Thompson, United States Public Health Service. The field staff was detailed by the Public Health Service to Niagara Falls to study and report upon (1) the hygiene and sanitation in the plants, making recommendations for correcting faulty conditions; and (2) the extent to which women might be employed if war conditions should necessitate their going into the plants in increasing numbers.

This report is limited to summarizing the field workers' findings on the hygiene and sanitation in the individual plants, the answers to the question raised as to the employment of women in the industries

¹ Health hazards in the industries of Niagara Falls, N. Y., by Paul M. Holmes. In Public Health Reports, issued by the United States Public Health Service, Washington, January 2, 1920. Pp. 1-20.

having been dealt with in a report of the Woman in Industry Service, entitled "Proposed employment of women during the war in industries of Niagara Falls."¹

The inquiry conducted by the field force extended from August 10 to September 10, 1918. The detailed written reports covered the following points for each department and process of each plant: The nature and construction of the buildings; the ventilation, humidity, dust, fumes, gases, illumination, infection hazards, specific poisons, extremes of heat or cold, noises, and odors; the personal service facilities, such as toilet, washroom, locker, eating, drinking, and rest-room accommodations; the medical and surgical care of employees, including physical examinations and first-aid practice; hours of work, fatigue, absenteeism, and labor turnover; transportation facilities to and from work; and the educational measures used to prevent occupational ailments among workers. It is explained that the individual plant reports, covering the above points and containing detailed and specific recommendations for removing health hazards, were sent to the respective plant executives.

The investigation covered the 21 plants represented in the employers' association. With the exception of a few plants, this number includes all the industrial establishments in Niagara Falls. The following table shows the number of employees in these plants, which are grouped by products manufactured:

NUMBER OF EMPLOYEES IN 21 INDUSTRIAL PLANTS OF NIAGARA FALLS,
GROUPED BY PRODUCTS MANUFACTURED.

Products manufactured.	Number of plants.	Number of employees.		
		Men.	Women.	Total.
Abrasives.....	3	1,734	490	2,224
Chemicals and gases.....	8	2,242	8	2,250
Electrodes and carbon.....	3	1,230	19	1,249
Metals and alloys.....	4	2,667	33	2,700
Miscellaneous.....	3	650	132	782
Total.....	21	8,523	682	9,205

Summary of Hazards Encountered.

The report contains a summary of the study of each of the five groups. In the abrasive industries the chief hazard is dust and this hazard, in the opinion of the writer, was "by far the most serious of any of the industrial health hazards in Niagara Falls." The three plants investigated cover the entire industry in Niagara Falls. Two manufacture crude abrasive material, which is shipped to other places to be made into commercial articles; the third makes

¹ This report was reviewed in an article published in the MONTHLY LABOR REVIEW for June, 1919, pp. 231-246.

both the crude material and the finished product. It was found that all employees are exposed to dust in varying amounts; not even the office force escapes. Tables are given showing nationalities of the workers of these three plants and the dust content of air in a lathe room, in a shaving room, in the grinding room, and in the plant offices and laboratories. Characteristics of the abrasive dust are that the particles are very hard, being second only to the diamond in this quality; and that they are insoluble in ordinary acids or fluids, and are from 95 to 100 per cent inorganic material. The particles are exceedingly jagged and sharp, according to photomicrographs of samples. This dust is very injurious to the lungs, as when once inhaled it is never removed. One to five years are required for the effects of it to develop. The main reason assigned by the report for workers not showing marked ill effects from this dust is that the labor turnover was so large that hardly any workers in the very dusty processes remained long enough to acquire serious damage to their lungs.

In the group of plants manufacturing chemicals and gases (90 per cent of their products being for war purposes), fumes and gases—particularly chlorine gas, hydrogen gas, and caustic fumes, nitrous oxide and benzol fumes—dusts, and caustic burns are the chief hazards, but on the whole the conditions regarding protection from these were comparatively good and were being improved.

In the manufacture of electrodes and carbon compounds a dust, "in no way comparable, as far as detrimental effects to the respiratory system are concerned, to the abrasive dusts" mentioned in connection with the abrasive industries, and heat from the furnaces, are the most objectionable conditions.

In the plants manufacturing metals and alloys the hazards are excessive heat, furnace gases, and dusts. "In none of the plants in the other groups are such large numbers of workers exposed to high temperatures as in this electrothermal industry." In no instance was any provision made to reduce the heat by water screens, heat chains, fans, or other devices. Carbon monoxide and carbon dioxide were hazards in two plants, and phosgene was not adequately removed in one plant.

In the miscellaneous group the hazards were chiefly lead and brass poisoning and sulphuric acid fumes.

Only 1 plant employed a full-time physician; 2 plants employed one physician each on part time; 18 called a physician in case of accident, sickness, or any emergency that the first-aid agent could not handle. Physical examinations were made in three plants, but not according to any set plan. Employees in the dusty processes of one abrasive plant were examined physically every three months by two

first-aid men, neither of whom was a physician. These examinations were supervised by the doctor. In no instances were employees examined before employment, and, with the one exception mentioned, none at regular intervals after employment.

The general average of labor turnover per month for the five-month period preceding the survey was found to be 25 per cent in the abrasive industry, 24 per cent in chemicals, 58 per cent in the electrical industry (1 plant for four weeks), 40 per cent in metals and alloys, and 53 per cent in one plant classed as miscellaneous.

It is an interesting and significant fact that one plant in the group manufacturing chemicals, having a grading of "good" with regard to hygienic conditions in the plant and excellent personal service facilities, had the lowest labor turnover—approximately 12 to 15 per cent per month—while another plant in the same group graded as "poor" had the highest turnover, or 33 per cent per month.

The prevailing hours of work were found to be 10 in the abrasive industry (75 per cent of the employees); 9 in chemical plants (60 per cent of the employees); 9 and 10 in the electrode plants (52 per cent of the employees); 8 and 12 hour shifts in the metals and alloys group (60 per cent of the employees); and 9 and 10 hours per day in the miscellaneous group (85 per cent of the employees).

Results of the Survey and Recommendations.

In April, 1919, two officers of the Public Health Service were detailed to Niagara Falls to see what action had been taken concerning the recommendations for improvement of plant hygiene and sanitation which had been made several months before to each plant executive. They found that a number of the recommendations had been put into effect, including the following: In abrasive plants, marked changes and extensions in the dust-collecting system; in the carbon and electrode plants, dust-collecting apparatus and drinking fountains; and in the other plants, varying improvements.

The following excerpt from the report summarizes the recommendations suggested by the survey:

In view of the great number and the seriousness of the health hazards in the industries of Niagara Falls, it is imperative that permanent and full-time supervision of the physical condition of the workers and work places be instituted. This, in the opinion of the writer, can be best accomplished by an industrial hygiene unit, located in Niagara Falls.

The following is a tentative outline of the organization and functions of such a unit:

At the head of the unit is the advisory board consisting of two representatives each from the employers, the employees, the medical society, and the chamber of commerce, together with the local health commissioner and the local factory inspectors. As executive head and directly under the advisory board comes the director, a physician, preferably trained or experienced in industrial hygiene, and emphatically of executive ability. The director's force should consist of one physician, two industrial nurses, one industrial hygienist (nonmedical), and one mechanical engineer.

The functions of the organization may be briefly set forth as follows:

1. To make physical examinations of the workers engaged in the hazardous occupations;
2. To make plant inspection, to carry on research work, and to make specific recommendations for removing hazards;
3. To work cooperatively with the hospitals; to have charge of the occupational disease clinic;
4. To carry on educational work for the prevention of occupational diseases; and
5. To cooperate in work with the United States Public Health Service, the New York Department of Labor, the New York Department of Health, the local department of health, the local medical staff, employment departments, the local medical societies, etc.

To meet the expenses of a unit of this kind it is suggested that the most satisfactory plan would be to have it financed on a pro rata basis by the manufacturers of Niagara Falls. The size of the unit could be definitely fixed and it is recommended that the members of the organization should be selected for permanent and full-time duty. Most of the Niagara Falls plants are too small to consider the employment of a full-time physician, and, in some instances, even a nurse, declares the report.

A medical organization with engineering personnel that will direct physical examinations of employees to note physical defects, analyze jobs, and place workers where they are best fitted to do a full day's work without injury to themselves, study the occupational hazards, give care to those injured or made ill by such hazards, and adopt engineering plans for their elimination, will find the monetary outlay insignificant as compared with the reduced cost in production and the increased output.

The Chemical Industry.

AN ACCOUNT of the health hazards of the chemical industry in New York State, with recommendations for remedying the various conditions which have been found to be dangerous to employees and employers alike, are set forth in a bulletin¹ recently issued by the New York Industrial Commission. A brief historical survey of the industry is given, and reference is made to the fact that 89 per cent of all the electrochemical products made in the United States are manufactured along the banks of the Niagara River, where power from the Niagara Falls is available. The chemical industry, however, is carried on quite extensively in other parts of the State. The products of this industry "are so vast and numerous and involve so many processes that it would be an impossibility in this bulletin to point out and describe all operations in which risks occur, it being the intention to show some of the most commonly occurring accidents for which remedies to prevent their occurrence may be applied." It is suggested that in some of the

¹ Health hazards of the chemical industry, New York Industrial Commission Special Bulletin No. 96. Albany, November, 1919, 69 pp. Illustrated.

plants the average workman knows little or nothing of the nature or effect of the substances which he constantly handles, "this ignorance being fostered by some manufacturers for the purpose of protecting their secrets from their competitors or keeping the men at work in positions which they would refuse to hold if they realized the dangers of their occupations. Many of the materials are referred to only as 'dope,' 'stuff,' 'liquor,' or by initials which have no relation to the name or real composition of the material."

The report notes first the danger arising from the use of artificial lights, particularly open gas lights, although electric lights also cause explosions under certain conditions.

Heating constitutes another hazard, some factories being found in which salamander stoves are used without any means being provided to convey to the outer air the products of combustion. In a majority of cases, however, steam is used as the heating medium and here the danger lies in the possibility of volatile and inflammable material coming into contact with the heated pipes. To avoid this the use of screens is suggested.

In the course of the survey made by the industrial commission it was found that many cases of occupational poisoning were definitely traceable to the lack of adequate ventilation of factory work-rooms, the employees being compelled constantly to inhale deleterious materials arising from machines or mixing and packing processes. It is regarded as most important that a proper system of ventilation be provided to eliminate health and fire hazards by removing dust, gases, vapors, and fumes arising in the various processes used in the particular industry.

It was pointed out that workers in chemical factories are subjected to the danger of accidents from the same general causes as workmen in other classes of manufacture, but in addition they are subject to the danger of burns from acids or molten metal, the corrosive effect on the body tissues of caustic alkalis, alkaline earths, and chromium salts, and the poisonous effects of the inhalation of certain dusts, gases, fumes, and vapors. The breaking up, by means of sledge hammers, of hard, heavy, or tenacious material presents a serious eye hazard. There is also danger to the eye where caustic soda, metallic sodium, sodium peroxide, oxide of lime, ammonia, and chlorinated lime are handled or used. Dermatitis, especially of the hands and arms, is mentioned as a common malady among the employees in color works. Here also droppings from trays on which the workers carry material become dried and are soon reduced to a powder, thus constituting a serious dust hazard.

Toxic Effect of TNT Due to Inhalation of Fumes.

The bulletin states that one important fact brought out by the investigation is the repudiation of the statement made by many writers both in America and England that the toxic effects of TNT are due solely to absorption of the finished product through the skin or to the inhalation of the material in dust form. It was found that the majority of cases of illness from this substance was due to inhalation of the fumes generated through the nitration of the toluol, the fumes of the first nitration (mononitrotoluol) apparently being the most dangerous.

The report gives a brief statistical summary of 7,139 accidents in three factories employing 3,607 workers. Of the total injuries 1,245, or 17.4 per cent, were eye injuries, and 1,081, or 15.1 per cent, were caused by burns. About 36 per cent of the injuries are classed as lacerations.

Brief attention is given to the hazard caused by handling carboys. The fire hazard is an important one in chemical industries. Chemical reaction—changes which take place when certain substances are brought together—furnishes a long list of materials which may produce fire. Friction, shock, static sparks, and the carrying of matches may be the causes of fire. The report gives a list of materials which should not be stored together indiscriminately lest a fire result.

Reference is made to unsafe practices—carelessness on the part of employees. This applies to any industry, “but in the manufacture of chemicals the workers are exposed not alone to the hazards met with in ordinary manufacturing lines, but to the additional ones created by the handling of acids, poisonous materials, and hot liquids, and here above all other places short cuts and the game of chance (the unsafe way) usually fail.”

The report concludes with nearly four pages devoted to 33 recommendations for remedying the hazards to which chemical workers are exposed. Generally speaking these recommendations pertain to the installation of safety valves on devices in which pressure is carried, and of a lighting system of such a type as to prevent ignition of any gas, vapor, or dust which is present or may be generated or produced; prohibition of practice of lowering electric light globes into tanks, etc., in which vapors, fumes, gases or dust are present; prohibition of the use of salamander stoves unless adequate means is provided for conveying the products of combustion out of the factory; installation of radiators or steam pipes used for artificial heating purposes so that a space of not less than 2 inches shall be left between the wall and the radiator or steam pipe; the wearing of suitable goggles by all employees engaged in breaking, chipping, crushing, or grinding hard or tenacious material, and the wearing of

masks or goggles when acids, alkalies, or dangerous or poisonous chemicals are used; the provision of drowning tanks containing plain water, or a solution of bicarbonate of soda in all places where acids are handled or used; the provision of shower baths in the ratio of one for every 20 employees where substances which have an irritating or corrosive effect on the skin are made, handled, or used; the tagging of all valves; provision of powder shoes or shoes with rubber soles, and of wooden shovels and sieves, in all factories manufacturing or handling explosives; prohibition of the carrying of matches, etc., into any factory where explosives, oxidizing agents, or inflammable gases or liquors are made or handled. The recommendations further provide that all employees shall be made acquainted with the nature of the materials with which they work; that explosives or substances having powerful oxidizing qualities or substances in which chemical combination may generate heat, flame, or gas, shall not be stored in rooms or closets in such manner that they may fall or become combined and create a fire or explosion; that suitable protection from the glare of the arc shall be provided for those required to look into furnaces in the electro-chemical industry; the prohibition of fires or furnaces, except under certain restrictions, within the same building with inflammable liquids; the installation of suitable and effective sprinkler systems in all plants engaged in the manufacture of TNT or certain other explosives; the maintenance of suitable and approved first-aid kits; the prohibition of smoking in any building, or on any premises connected therewith, in which explosives or inflammable liquids or gases are manufactured, handled, used, or stored.

The report contains a brief bibliography, though not complete, of works consulted in connection with the investigation.

WORKMEN'S COMPENSATION.

Investigation of Oregon Industrial Accident Commission.

THE interference by industrial accident commissions with the business of damage-suit lawyers continues to bear fruit in complaints against accident funds and investigations of them. The latest report to come to hand is one on the industrial accident commission of Oregon. It appears that an attorney had gone to the widow of a workman killed by accident and secured from her a contract based on a considerable percentage of the compensation award to be sought from the accident commission. When this came to the knowledge of the commission it took pains to see that the payment should reach the beneficiary and not the attorney, which was in accordance with the intention of the legislature in enacting the law. The attorney thereupon set about finding causes of complaint and publishing charges against the commission. This, with perhaps other incidents, led to the appointment of a committee representing employers, employees, and the public to make an investigation of the affairs of the commission.

The report of this committee, bearing date of January 10, 1920, describes the efforts made by it to run down all complaints and charges in an effort to determine their merits. The active aid and assistance of the commission was rendered freely. It was found that there were some technical violations of the law, not going to the merits of its administration, but really attaining more satisfactorily the desired ends. The case that furnished the largest amount of criticism was given special attention. It was found to be quite difficult from a legal standpoint, and it was concluded that "the commission used its best judgment at the time, and acted with proper intent, and that no serious criticism is justified." Quite the same conclusion was reached in other cases which were given considerable newspaper notoriety, and the recommendation concerning them was that further effort be made to ascertain the final results of the injuries with a view to a possible reopening of the cases.

Although wide notice was given of the purpose of the committee to consider all complaints, "less than a dozen requests all told have been made by those who wanted to appear before it with either complaints or suggestions." The attorney most active in presenting complaints submitted "some specific and a good many general

charges," but upon detailed investigation so many of these were found to be "without substantial foundation that the committee was inclined to attach very little importance to either the complaints or the suggestions."

Recommendations were made for an improved accounting system and a closer following up of accounts. However, the funds are reported as in a healthy condition, with reasonable surplus. Means of securing early payments to injured men were also recommended, as well as legislative action looking toward higher compensation awards. The commission was found not to be guilty of any misconduct, and the charges against it were in the main declared to be groundless. Suggestions for educational work to make the provisions of the law better understood, for some improvement in administrative methods, and for a periodical review of the administration of the fund by an independent commission, which should hear complaints and make recommendations for improvements, conclude the committee's report.

The fund showed assets amounting to \$2,878,484 on July 1, 1919, and premium receipts from employers up to December 31 of \$1,271,564. Employees contributed \$96,194. Oregon is the only State in which employees contribute to the regular compensation funds, the rate being 1 cent for each day worked. Interest, a State appropriation of \$207,428, and some other items bring the total assets and receipts for the half-year up to \$4,545,248. From this were paid benefits amounting to \$504,551, medical aid, \$201,460, and funeral expenses, \$8,700. Administrative expense during the six months amounted to \$91,780.

On December 31 the ledger assets were \$3,858,542, with a net surplus of \$668,808, a gain of \$426,996 in surplus during the six months.

New Chairman of California Industrial Accident Commission.

AT A meeting of the California Industrial Accident Commission, held on January 24, 1920, Will J. French, second member of the commission, was elected chairman to succeed A. J. Pillsbury, who retired from that position following an agreement that the chairmanship should rotate. Mr. Pillsbury remains a member of the commission. These gentlemen have been associated in connection with the administration of the Workmen's Compensation, Insurance, and Safety Act of California since the date the act became effective on September 1, 1911, and in assuming the duties of the office the new chairman paid high tribute to the faithful services rendered by Mr. Pillsbury.

Comparison of Canadian Workmen's Compensation Laws.¹

By CARL HOOKSTADT.

WITH the single exception of Prince Edward Island, all of the Provinces of Canada, including the Dominion Government, have enacted workmen's compensation legislation. The law of Saskatchewan, however, although designated in its title as a workmen's compensation law, is merely an employer's liability act, and is therefore not included in the following discussion. The Dominion act provides that if a Federal employee (Government railroads excepted) sustains an injury he shall receive the same compensation as any other person would under similar circumstances receive under the law of the Province in which the accident occurred. Administration of the Dominion act is placed in the hands of the provincial boards, and any compensation awarded may be paid by the Dominion Minister of Finance.

Chronologically, Canadian legislation practically parallels that of the United States. The first law was enacted by British Columbia in 1902, followed by Alberta in 1908, Quebec in 1909, and Manitoba and Nova Scotia in 1910.² These early laws were patterned after the British act and were really modified employers' liability laws. No administrative commissions were provided, and usually suits for damages were permitted. A radical departure from the British type of law, however, took place in 1914, when Ontario enacted the first of the collective-liability compensation acts prevailing in most of the Provinces at the present time. These laws were patterned upon the mutual liability idea of the German workmen's compensation system and upon the exclusive State fund plan of the Washington act. Nova Scotia enacted a similar law in 1915, followed by British Columbia in 1916 and by Alberta and New Brunswick in 1918.

Canadian and American Laws Compared.

AN ANALYSIS of the Canadian laws shows a number of striking characteristics and of deviations from the American type of compensation act. Some of the more important of these are the following:

1. In Canada there is a remarkable uniformity among the several compensation laws. This uniformity applies to the scope of the acts, benefits, injuries covered, administration, and procedure. In

¹ Section of a forthcoming bulletin on Comparison of workmen's compensation laws in the United States and Canada. This comparison includes 1919 legislation.

² In the United States the Federal compensation act was passed in 1903, while Montana enacted a compensation law in 1909 and New York in 1910, though these early State laws were later declared unconstitutional.

the United States compensation acts are distinguished more for their dissimilarity than for their uniformity.

2. In Canada all of the laws are compulsory upon the employers coming within the scope of the act. In the United States only 13 are compulsory while 32 are elective.

3. In Canada the scope of the law in each Province (Yukon excepted) is limited to enumerated hazardous employments. There is some diversity in the number of such employments, but the principal hazardous industries are covered, including manufacturing, mining, construction, and transportation. In the United States only 13 States limit their scope to the so-called hazardous industries, while 32 States cover the "nonhazardous" as well as the "hazardous" industries.

4. In Canada occupational diseases are compensable in every Province except Quebec and Yukon. Such diseases, however, are limited to those enumerated in the statutory schedule. In the United States only 6 of the 45 State laws include occupational diseases, but in these 6 States all occupational diseases are covered.

5. In Canada all of the Provinces except Manitoba, Quebec, and Yukon have exclusive State insurance funds. In Ontario, however, employers under schedule 2 (municipalities, railroad, express, telephone, telegraph, and navigation) are permitted self-insurance. In the United States only 8 of the 45 States have exclusive State funds, while 9 have competitive State funds.

6. In Canada probably the most significant characteristic of compensation legislation is the assumption of liability on the part of the Province. Injured workmen are paid direct by the workmen's compensation board out of the accident fund. This is true, irrespective of whether or not the employer has contributed his premiums to the fund and even if the employer is insured or carries his own risk. Failure on the part of the employer to meet his compensation obligations does not deprive the injured workman or his dependents of compensation benefits. This obligation is assumed by the accident fund, which in turn has redress against the defaulting employer through an action at law. Under none of the laws in the United States does the State assume liability. In case of insolvency of the employer and insurance carrier the injured employee loses his compensation benefits.

7. In Canada the workmen's compensation boards have exclusive and final jurisdiction over all compensation matters, no appeal to the courts being permitted except in New Brunswick and Nova Scotia. In these two Provinces appeal may be had to the Supreme Court upon questions of law, but only with the permission of the judge of said court. In none of the States of America does the administrative commission have final jurisdiction. In every State appeal may be had to the courts upon questions of law and in many of the States upon questions of fact.

8. In Canada members of the workmen's compensation boards hold office during good behavior, except that in British Columbia the term of office is 10 years. In most of the Provinces, however, they are subject to compulsory retirement at the age of 75. Each board is authorized to appoint its officers and employees and to fix their salaries. The term of office of such employees is subject to the pleasure of the board. In the United States the term of office of compensation commissioners is usually 3, 4, or 5 years.

9. As regards liberality, the benefits of the Canadian laws are about on a par with the more liberal of the American acts. The scale of benefits is considerably lower, but on the other hand the periods for which benefits are paid are much longer. In Canada compensation is usually paid during disability or until death or remarriage of the widow, while in most of the States the compensation periods terminate at the end of 300, 400, or 500 weeks. In none of the Provinces (Yukon excepted) is the waiting period over 1 week, and in most of the laws compensation when payable begins from the date of the injury, whereas in the United States 7 States have a waiting period of 10 days and 13 States of 2 weeks. In all of the Canadian laws the amount of compensation in case of disability is 55 per cent of the employee's earnings, except that in Quebec the percentage is 50; in the United States 20 States have a percentage of 60 or greater. The early Canadian laws did not provide for medical benefits, but some of the Provinces have recently made provision therefor; in the United States 42 of the 45 States provide medical service. All but five of these States, however, place some limitation upon the amount of the medical service which the employer is required to furnish.

Compensation and Insurance Systems.

ALL of the Canadian laws are compulsory upon employers coming within the scope of the act. In the five Provinces of Alberta, British Columbia, New Brunswick, Nova Scotia, and Ontario¹ all employers must contribute to the accident fund. Quebec and Yukon Territory have no State fund nor are employers in these jurisdictions required to insure. Manitoba has a hybrid system. Employers are required to insure in private casualty companies or provide self-insurance. Such insurance companies or self-insurers, however, must contribute to the accident fund. They must also contribute 7½ per cent of their premiums to the administration fund.

Out of these accident funds, which are managed by the workmen's compensation boards, are paid all compensation claims. The board

¹ Except employers enumerated in schedule 2, which includes municipalities, and railroad, express, telephone, telegraph, and navigation companies. Employers in these industries are individually liable, though they must deposit funds with the board, which pays the compensation direct to the injured employee.

classifies the industries according to the hazard, fixes and collects premiums, receives and investigates claims, grants awards, and pays the compensation benefits. As already noted, the workmen's compensation board assumes liability. Injured workmen are always paid direct by the board from the accident fund irrespective of whether or not the employer is insured or carries his own risk. Failure on the part of the employer to meet his compensation obligations does not deprive the employee of his compensation benefits. This obligation is assumed by the accident fund, which in turn has redress against the defaulting employer through an action at law.

Scope or Coverage.

THE scope or coverage of the Canadian laws is more restricted than that of most of the American acts. In all of the Provinces (Yukon excepted) the employments covered are limited to enumerated hazardous industries. Agriculture and domestic service are universally excluded. Most of the laws also exclude outworkers, traveling salesmen, nonhazardous clerical occupations, nonhazardous public employments, and casual employees employed otherwise than for the purpose of the employer's business. Alberta also excludes railroads. Moreover the workmen's compensation boards have been given discretionary power both to increase and to decrease the scope of the acts by adding to or subtracting from the industries enumerated in the statute. Under this authority the original statutory scope of the acts has been considerably changed. Many new classes of industries have been added; others have been excluded. In addition, the Ontario board has exempted certain classes of employers having less than a stipulated number of employees. The policy of the boards in including and excluding certain industries is apparently determined by the hazard of the particular industry and by the administrative difficulty of collecting premiums in the case of small employers. Exempted employments usually are given the privilege of coming under the act if either the employer or employee so desires.

Under all of the Canadian laws employees injured without the Province are entitled to compensation benefits if the place of business of the employer and the usual place of employment of the workmen are in the Province. The following provision found in the Alberta law is typical of that in the laws of practically all the Provinces:

(1) Where an accident happens while the workman is employed elsewhere than in the Province which would entitle him or his dependents to compensation under this act if it had happened in the Province, the workman or his dependents shall be entitled to compensation under this act—

(a) If the place or chief place of business of the employer is situate in the Province and the residence and the usual place of employment of the workman are in the Province and his employment out of the Province has immediately followed his employment by the same employer within the Province and has lasted less than six months; or

(b) If an accident happens to a workman who is a resident of the Province and the nature of the employment is such that in the course of the work or service which the workman performs it is required to be performed both within and without the Province.

(2) Except as provided by subsection 1, no compensation shall be payable under this act where the accident to the workman happens elsewhere than in the Province.

The following table shows more in detail the scope of the several Canadian compensation acts:

SCOPE OF CANADIAN COMPENSATION LAWS.

Inclusions: Enumerated hazardous employ- ments.	Exclusions. ¹				
	Outworkers.	Traveling salesmen.	Nonhazard- ous clerical occupations.	Casual-em- ployees not in usual course of employer's business.	Public and other employments.
Alberta.....	Alberta.....	Alberta.....	Alberta.....	Alberta.....	Alberta (nonhazardous municipal; railroads; itinerant employees).
British Columbia.....	British Columbia.....	British Columbia.....	British Columbia.....	British Columbia.....	British Columbia (nonhazardous public).
Manitoba.....	Manitoba.....	Manitoba.....	Manitoba.....	Manitoba.....	Manitoba (nonhazardous public).
New Brunswick.....	New Brunswick.....	New Brunswick.....	New Brunswick.....	New Brunswick.....	New Brunswick (provincial).
Nova Scotia.....	Nova Scotia.....	Nova Scotia.....	Nova Scotia.....	Nova Scotia.....	Nova Scotia (nonhazardous public).
Ontario.....	Ontario.....			Ontario.....	Ontario (provincial and nonhazardous municipal).
Quebec.....					Quebec (public employees; sailing vessels; employees receiving over \$1,200 a year and those working alone).
	Yukon.....			Yukon.....	Yukon (employers having less than 5 employees).

¹ Agriculture and domestic service are universally excluded.

Accidents and Occupational Diseases.

CANADIAN compensation laws cover both accidents and occupational diseases. The provisions of the British act, both as to content and phraseology, have been adopted practically without change in nearly all of the Provinces. Every law except Quebec uses the phrase "personal injury by accident arising out of and in the course of the employment, unless it is attributable solely to the serious and willful misconduct of the workman." In four Provinces,¹ however, injuries due to willful and serious misconduct are compensable if they result in death or serious disability. In addition, New Brunswick excludes injuries if intentionally self-inflicted, due to intoxication, or caused by a fortuitous event not connected with the industry. Quebec also excludes intentionally self-inflicted injuries, while Yukon excludes those caused by intoxication.

As regards occupational diseases the Canadian Provinces followed the compensation law of Great Britain which originally included the following diseases and processes:

¹ Alberta, British Columbia, Manitoba, and Nova Scotia.

OCCUPATIONAL DISEASE SCHEDULE OF BRITISH WORKMEN'S COMPENSATION
LAW OF 1906.

Disease.	Process.
Anthrax.....	Handling of wool, hair, bristles, hides, and skins.
Lead poisoning or its sequelae.....	Any process involving the use of lead or its preparations or compounds.
Mercury poisoning or its sequelae.....	Any process involving the use of mercury or its preparations or compounds.
Phosphorus poisoning or its sequelae.....	Any process involving the use of phosphorus or its preparations or compounds.
Arsenic poisoning or its sequelae.....	Any process involving the use of arsenic or its preparations or compounds.
Ankylostomiasis.....	Mining.

Manitoba and British Columbia adopted verbatim the British act of 1906; Alberta and Ontario added miners' phthisis to the original list; while Nova Scotia added the three following diseases: Subcutaneous cellulitis of the hand (miners' beat hand), subcutaneous cellulitis over the patella (miners' beat knee), and acute bursitis over the elbow (miners' beat elbow). New Brunswick did not adopt the British schedule, but grants compensation benefits for all occupational diseases, as determined by the board, contracted in industries within the scope of the act. Quebec and Yukon do not compensate for occupational diseases.

However, the foregoing diseases are compensable only if they are due to the nature of any employment in which the workman was employed at any time within one year previous to the date of disability. Compensation shall be payable in the first instance by the last employer. The latter, however, may recover from other employers whose employment had within the year contributed to the contraction of the disease.

Waiting Period.

WITH the exception of Yukon Territory none of the Canadian compensation laws have a waiting period of over one week. In two Provinces the waiting time is only three days. Furthermore, in most of the Provinces compensation when payable begins from the date of the injury. The following table shows the waiting period for each Province:

WAITING PERIOD OF CANADIAN COMPENSATION LAWS.

Province.	Waiting period.
Alberta.....	3 days. None if disability lasts 10 days or more.
British Columbia.....	3 days.
Manitoba.....	6 days. None if disability is permanent or lasts over 6 days.
New Brunswick.....	1 week.
Nova Scotia.....	6 days. None if disability lasts over 6 days.
Ontario.....	6 days. None if disability lasts over 6 days.
Quebec.....	1 week. None if totally and permanently disabled.
Yukon.....	13 days. None if disability lasts over 13 days.

Compensation Benefits.

THE compensation benefits of the Canadian laws are about on a par with the more liberal American acts. The scale of benefits is considerably lower, but on the other hand, the periods for which benefits are paid are much longer, compensation usually being paid during disability or until death or remarriage of the widow. In case of death the usual provision is a fixed monthly pension of \$20 to the widow, with an additional \$5 a month for each child, but not over \$40 in all. In case of disability the usual compensation is 55 per cent of the employee's earnings, to be paid during disability. The following table shows the per cent of wages paid as compensation, maximum weekly or monthly payments, and maximum period and amount of compensation payable in case of death, permanent total disability, and partial disability.

PER CENT OF WAGES PAID AS COMPENSATION, MAXIMUM WEEKLY OR MONTHLY PAYMENTS, AND MAXIMUM PERIOD AND AMOUNT OF COMPENSATION PAYABLE IN CASE OF DEATH, PERMANENT TOTAL DISABILITY, AND PARTIAL DISABILITY.

Province.	Per cent of wages.	Monthly or weekly maximum.	Maximum period and amount of compensation.		
			Death.	Permanent total disability.	Partial disability.
Alberta	Not based on wages	\$40 monthly pension (death); \$16 weekly pension (total disability).	Probable industrial life of deceased (\$2,500).	L i f e (\$2,500)	\$1,000.
British Columbia..	55 (disability).	\$40 monthly pension (death); \$22 weekly (total disability).	Probable industrial life of deceased.	Life.....	During disability.
Manitoba	55 (disability).	\$40 monthly pension (death); \$22 weekly (total disability).	Probable industrial life of deceased.	Life.....	During disability.
New Brunswick...	55 (disability).	\$40 monthly pension (death); \$15.86 weekly disability).	Probable industrial life of deceased (\$3,500).	L i f e (\$3,500).	During disability (\$1,500).
Nova Scotia.....	55 (disability).	\$40 monthly pension (death); \$13.20 weekly (total disability).	Probable industrial life of deceased.	Life.....	During disability.
Ontario	55 (disability).	\$60 monthly pension (death); \$22 weekly (total disability).	Probable industrial life of deceased.	Life.....	During disability.
Quebec	50 (disability).		4 years' earnings (\$2,500).	L i f e (\$2,500).	During disability.
Yukon	50 (temporary total).		\$2,500.....	\$3,000.....	\$3,000.

Weekly or Monthly Maximum.

The provisions relative to weekly or monthly maximums differ widely as between death and disability. In case of death the monthly maximum is usually \$40 (Ontario, \$60) but not over 55 per cent of the employee's wages. In case of total disability the weekly maximum amounts range from \$13.20 in Nova Scotia to \$22 in British Columbia, Manitoba, and Ontario. The Quebec and Yukon laws make no provision in this regard.

Death.

Compensation benefits in case of death are not based upon wages. Instead, all of the Provinces except Quebec and Yukon provide a fixed monthly pension of \$20 for the widow (\$30 in Ontario) with an additional \$5 for each child (\$7.50 in Ontario). Payments to the widow continue for a period equal to the probable industrial life of the deceased husband, or to quote the law, "the payments shall continue only so long as in the opinion of the board it might reasonably have been expected had the workman lived he would have contributed to the support of the dependents." Payments to the children cease at 16 years and to the widow upon remarriage, except that in the latter event she is paid a lump sum equal to two years' compensation. Two of the above Provinces have a maximum limit; in Alberta this limit is \$2,500 and in New Brunswick \$3,500. Under the Quebec law the death benefits are four years' earnings of the deceased employee (maximum, \$2,500), while the Yukon law provides a flat sum of \$2,500. In addition to the compensation benefits most of the Provinces provide also for burial expenses, the maximum allowance usually being \$75.

Total Disability.

In all of the Provinces (except Yukon) compensation for total disability accidents continue during disability and in case of permanent disability during the life of the injured workman. Three Provinces, however, provide a maximum limit--Alberta and Quebec \$2,500 and New Brunswick \$3,500. In five Provinces (British Columbia, Manitoba, New Brunswick, Nova Scotia, and Ontario) the amount of compensation is 55 per cent of the employee's wages, subject to weekly maximum and minimum limits. In Quebec the percentage is 50, while in Alberta the amount is not based upon wages, a weekly pension (maximum \$16, minimum \$10) being provided instead.

Partial Disability.

The Canadian method of compensating partial disability accidents differs widely from the popular American method. Most of the laws in the United States contain a schedule of specified partial disabilities for which benefits are awarded for stated periods, the weekly payments being based upon a percentage of wages earned at the time of the injury. In Canada all of the Provinces except Alberta and Yukon base the amount of compensation upon the wage loss or impairment of earning capacity, payments continuing during disability. The workmen's compensation boards have authority to formulate partial disability schedules in which the loss of earning capacity of the various disabilities is expressed in percentages of total disability. The age and occupation of the injured workman is usually taken into con-

sideration in determining his impairment of earning capacity. One of these Provinces, however, has a maximum limit—New Brunswick \$1,500. Alberta and Yukon have adopted the Washington method and provide fixed amounts for certain specified injuries.

Medical Service.

ALTHOUGH none of the early Canadian acts provided medical or surgical service in the present acceptation of the term, some of the Provinces have recently made provision therefor. The following table shows for each Province the amount of medical and surgical aid and the conditions under which it is furnished:

MEDICAL SERVICE PROVIDED UNDER CANADIAN COMPENSATION LAWS.

Province.	Maximum amount, and other qualifications.
Alberta.....	Reasonable expenses of last sickness in fatal cases involving no dependents; in other cases employees furnished medical aid from employer's hospital fund or State accident fund to which employees must contribute.
British Columbia....	Such service as reasonably necessary; transportation included; special provision for seamen; employer's hospital-fund permitted.
Manitoba.....	Such medical attendance as board deems reasonable; maximum \$100; additional special treatment in permanent disability cases if compensation costs can be reduced.
New Brunswick.....	Such special medical and surgical treatment as will conserve the accident fund and such first-aid and hospital treatment as the board may require.
Nova Scotia.....	Reasonable service for 30 days in compensable injury cases; additional treatment if necessary to reduce disability; special provision for seamen; approved establishment benefit schemes permitted.
Ontario.....	Necessary service in compensable injury cases; transportation included; approved establishment benefit schemes permitted.
Quebec.....	No provision.
Yukon.....	No provision.

Nonresident Alien Dependents.

WITH the exception of Quebec all of the Provinces grant compensation to nonresident alien dependents but with certain qualifications and restrictions. In Alberta, the law provides that it shall be conclusively presumed that a workman, two years after his arrival in Canada, has no nonresident dependents other than his parents—one year after his arrival in case the workman is not of British nationality. In British Columbia nonresident alien dependents are entitled to compensation, but the board may award such lesser sum as will, according to the conditions and cost of living in the place of residence of such dependents, maintain them in a like degree of comfort as dependents of the same class, residing in Canada and receiving the full amount of compensation, would enjoy. In the other five Provinces (Manitoba, New Brunswick, Nova Scotia, Ontario, and Yukon) a nonresident alien dependent shall not be entitled to compensation unless by the law of the country in which he resides the dependents of a workman to whom an accident happens in such country if resident in Canada would be entitled to compensation.

Moreover, the amount of compensation shall not be greater than that granted under the foreign law. Furthermore, in Manitoba and Ontario, nonresident enemy aliens are excluded entirely from the benefits of the act. Ontario also denies compensation to a resident of a country "voluntarily withdrawn from alliance with the British Empire during the Great War, or of a country in default of establishing peaceful and harmonious relations with the British Empire." The Quebec law does not grant compensation to nonresident alien dependents.

Administration.

IN ALL of the Provinces except Quebec and Yukon, which have the court type of law, the administration of the compensation acts is under workmen's compensation boards. The members of the boards are appointed by the lieutenant governor and hold office during good behavior, except that in British Columbia the term of office is 10 years. In four¹ of the Provinces, however, the commissioners are subject to compulsory retirement at the age of 75. Each board is authorized to appoint its officers and employees and to fix their salaries. The term of office of such employees is subject to the pleasure of the board.

The boards have final and exclusive jurisdiction over all compensation matters, no appeal to the courts being permitted except in New Brunswick and Nova Scotia. In these two Provinces appeal may be had to the supreme court upon questions of law, but only with the permission of the judge of said court.

Accident Prevention.

OF THE six Canadian Provinces having administrative compensation boards, the British Columbia board is the only one which has statutory jurisdiction over accident prevention work. In all of the other Provinces this function is performed by other State or private agencies. The Alberta and Manitoba compensation laws made no provision for accident prevention at all, while the laws of New Brunswick, Nova Scotia, and Ontario authorize employers' associations to undertake this work, with a rather loose supervision by the workmen's compensation board.

¹ Manitoba, New Brunswick, Nova Scotia, and Ontario.

SOCIAL INSURANCE.

Increase in Statutory Benefits Under British Laws.

INCREASES in cost of living are notably burdensome in the case of persons whose income is fixed by law, as in the case of public employees, and more especially of persons whose income is derived from pensions or other fixed awards.

Amendment of Workmen's Compensation Law.

TO MEET the needs of persons in one of these latter classes, i. e., injured workmen, the British compensation law was amended in 1917 by adding 25 per cent to current and accruing awards payable during total incapacity on the basis of the original act. This addition was to be effective during the period of the war and for six months thereafter. On December 30, 1919, royal assent was given to a "war addition" amendment, 1919, changing the 25 per cent increase to one of 75 per cent, effective January 1, 1920. This is an amendment to the Workmen Compensation (War Addition) Act, 1917, but contains no limitation as to term.

Old-Age Pensions Act, 1919.¹

ANOTHER liberalizing enactment is one affecting the Old-Age Pension Acts, 1908, 1911. Perhaps the first change to attract attention is the increase of the maximum pension allowance from 5s.² per week to 10s. Pensions vary in accordance with the amount of income derived from other sources, being so graduated that the maximum receipts from property owned or other resources, combined with the pension allowance, shall give a weekly support amounting to 20s. This is the result of the 1919 amendment, and contrasts with the maximum of 13s. provided for by the law of 1908.

The original act allowed no benefits where the claimant had yearly means in excess of £31, 10s. but the amendment advanced this sum to £49, 17s. 6d. This enlargement of course brings an additional number of persons within the purview of the act, estimated to be 220,000.

A third change of importance is one striking out the provision that the receipt of poor relief would bar the recipient from pensions.

¹ Source: Local Government Journal, London, Dec. 27, 1919.

² Owing to fluctuations in exchange value conversions into United States money are not made. The normal par value of the pound is \$4.87, of the shilling 24.3 cents, and of the penny 2 cents.

It was held that this was an artificial disqualification, laying an unwarranted social slight on the recipient of poor relief. It also led to inadequate standards of living; while now if the pensioner is found in need of outdoor relief, it is recognized as merely another form of assistance of the same general nature.

Other changes relate to term of residence, prison sentences, the status of wives of aliens, etc., the changes generally being in the direction of liberality.

Civil-Service Pensions.¹

A THIRD item of like nature to the foregoing relates to the amounts of retirement pensions for civil servants. Due to a war bonus award, the Treasury agrees to add 40 per cent to the retiring salary, where it does not exceed £300, and 30 per cent to higher salaries, instead of 25 per cent and 20 per cent, as formerly. Thus a man drawing £100 annual salary would be rated £140 for retirement purposes, making his "half-pay" on retirement £70 instead of £63 as before.

Restriction of Unemployment Benefits in Austria.²

IN VIEW of the serious financial situation in Austria, the Government has decided to proceed energetically with the abolition of unemployment benefits. The industrial district commission in Vienna has announced that it will cease to pay unemployment benefits to the following classes of workers:

1. Furniture makers, wheelwrights, shoemakers, brickmakers, clay workers, and women tailors.

2. Single and married unemployed manual workers and salaried employees with no children who before August 1, 1914, were not employed at work which involved compulsory sickness insurance or have not received suitable training in any trade in so far as in the opinion of the unemployment bureau they are unfitted for housework or agriculture.

3. Married women workers and employees (with the exception of those who before their husbands were called into military service were employed at work which made sickness insurance obligatory) whose husbands have returned from the war and are earning wages.

This limitation of unemployment relief is regarded by *Soziale Praxis* as a sound idea, which should be imitated in Germany, where the workers have turned the right to work into a right not to work.

LABOR LAWS.

Suspended Sentences in Labor Law Cases in New York State.

A PAMPHLET of 20 pages prepared by Bernard L. Shientag, chief counsel to the New York State Industrial Commission, considers the matter of suspended sentences in labor law cases. The purpose of the pamphlet is to give publicity to a practice that is largely prevalent in the State of New York with regard to violations of the labor laws. The State is divided into two inspection districts, one including New York City, and the other, known as the second inspection district, the rest of the State. The study covers a period of two and one-half years, from July 1, 1917, to December 31, 1919. The policy of the commission as set forth is to secure compliance with the provisions of the labor law with as little friction and hardship for the employers as possible. In most cases notice is first sent, and time allowed for remedying the practice concerning which complaint is made. If this is not done, a warning letter is sent by the counsel, and if that does not produce results, prosecution is begun. Even then if the owner or employer complies with the law, the department asks that proceedings be dismissed, and "it is only in exceptional cases where the employer uses improper or obstructive tactics that this procedure is not followed." Naturally, after this forbearance, and exclusion of cases in which there is compliance, even though tardy, the commission feels that there should be an actual enforcement of penalties.

There are two principal classes of cases noted, one class consisting of those under the factory law, and the other of those under the mercantile law. Factory law cases relate to fire protection and to child labor. Under the mercantile law the chief difficulty is with the illegal employment of children, hours of labor of women, and the allowance of a day of rest. During the year ended June 30, 1918, there were 967 convictions under the factory law, resulting in 529 fines, aggregating \$11,930; while in 438 cases, or about 45 per cent, sentence was suspended. In the second inspection district, fines were assessed in but 59 cases out of 221 convictions, sentences being suspended in 73 per cent of the cases. There was a higher degree of strictness with regard to offenses against the fire protection law in New York City, the percentage of suspended sentences being 9; the up-State courts, however, were more lenient, suspending sentences in 70 per cent of the cases,

though here the class of cases considered was more inclusive. Of the convictions in mercantile cases 70 per cent were granted suspended sentences in New York City and 80 per cent up-State.

Effort is being constantly made to secure better cooperation between the courts and the commission, and that some success in this connection is being achieved is shown by the following brief table:

PER CENT OF SUSPENDED SENTENCES DURING EACH SPECIFIED PERIOD, IN NEW YORK CITY AND UP-STATE.

Period.	New York City.	Up-State.
	<i>Per cent.</i>	<i>Per cent.</i>
July, 1917, to June, 1918.....	58	75
July, 1918, to June, 1919.....	50	70
July, 1919, to December, 1919.....	47	69

The point is made that while the courts as a rule reach a conclusion as to the guilt of the defendant which is satisfactory to the commission, there is a serious weakening of the laws by a too general failure to enforce the penalties. While most employers comply with the statutes, there are those who disregard them, and for whom a penalty is the only persuasive argument. This is particularly the case where children are illegally employed or women are worked prohibited hours. An exit once constructed or a building otherwise altered remains the same, while a child may be reemployed after dismissal or a door be locked again when the fear of inspection is absent. Since inspection can not be constant, the imposition of a penalty is an indispensable aid to the enforcement of the law, and for this the aid of the judges is essential.

All we can do is to call public attention to these matters, and to plead for a closer and more sympathetic cooperation between the commission and the courts, in order that the purpose and intent of these beneficent laws, so important to the safety and welfare of the people, may be fully carried out.

Comparison of Foreign Eight-Hour Laws.¹

By LEIFUR MAGNUSSON.

TWENTY countries had embodied in their legislation, and one in its constitution, the principle of the 8-hour day or 48-hour week before the International Labor Conference, under the League of Nations, drafted its convention recommending the 8-hour day and the 48-hour week for incorporation into national legislation. Thus, as pointed out in effect by various speakers among Government and labor delegates, the conference

¹ See also, Report on the 8-hour day or 48-hour week, prepared by the Organizing Committee for the International Labor Conference, Washington, 1919 [London, 1919], page 156.

was merely engaged in registering accepted principles, or at the very most, in harmonizing divergences of practice in respect to the application of the 8-hour day. It was insisted upon by the workers and the Government delegates that the committee appointed to study the matter and to draft a convention should consider only the practical aspects of the matter, that the principle had already been agreed upon. To appoint a committee to discuss the principle of the 8-hour day and the 48-hour week, would be, as one Government delegate wittily put it, like appointing a committee for the discovery of America.

Aside, however, from the fact that the principle of the shorter workday has already been agreed upon in the legislation of the major civilized countries, there remains much to be accomplished in harmonizing that legislation, stopping up loopholes in it, and making it effective in practice. Probably the most valuable result of the international convention will be the effect it has as a standard for legislation of the kind in question. The convention raises the standards set up in some of the national legislation by broadening the scope of the legislation, specifying exceptions more explicitly, and defining the rate of overtime and the circumstances justifying overtime.

In this article a comparison is made of the provisions of the various 8-hour laws and the international 8-hour convention. The State laws of the United States and those of the States comprising the Federal unions of some of the South American countries have been omitted. No attempt has been made to cover those 8-hour laws of certain countries which are applicable to public employments, nor those already applying to mines. While some of these newer laws include mining, yet before the war and before the springing up of these general 8-hour laws, mining was already practically an 8-hour industry the world over, and is now moving in the direction of a seven or six hour day.

The following statement shows the countries included and the date of enactment of the 8-hour laws:

GENERAL EIGHT-HOUR LAWS IN FOREIGN COUNTRIES.

Country.	Date.	Country.	Date.
Austria.....	Dec. 19, 1918.	Panama.....	Not ascertained.
Czecho-Slovakia.....	Dec. 9, 1918.	Peru.....	Jan. 15, 1919.
Denmark.....	Feb. 12, 1919.	Poland.....	Nov. 23, 1918.
Ecuador.....	Sept. 11, 1916.	Portugal.....	May 7, 1919.
Finland.....	Nov. 27, 1917 (amended Aug. 14, 19, 1918).	Russia.....	Oct. 26 (Nov. 11), 1917.
France.....	Apr. 23, 1919.	Serbs, Croats, and Slo- venes (Jugo-Slavia).	Sept. 12, 1919.
Germany.....	Nov. 23, 1918.	Spain.....	Apr. 3, 1919.
Luxemburg.....	Dec. 14, 1918.	Sweden.....	Oct. 17, 1919.
Mexico.....	Jan. 31, 1917. ¹	Switzerland.....	June 27, 1919.
Netherlands.....	Nov. 1, 1919. ²	Uruguay.....	Nov. 17, 1915.
Norway.....	Aug. 14, 1918.		

¹ Constitution.² Date in effect.

Types of Laws.

THERE are two general types of 8-hour laws:¹ (1) Those in which the coverage is specific; and (2) those in which it is general. In the first instance, the laws specify the industries in which the principle shall be applied or abated; and in the second instance, the principle is stated as a general rule, to be applied in industries as may be determined by administrative order, or by the action of arbitration courts. This classification is very general, and in both types of laws administrative orders defining and permitting exceptions of the principle play some part. The draft convention of the International Labor Conference is an example of the use both of specifications in the general law and of administrative authority.

The Australian and New Zealand systems are the only examples of standardization and enforcement through arbitration courts. The 8-hour day in these countries has been quite universal for several years, and is mainly the result of collective agreements between employers and workers and of awards of the arbitration courts and trade boards. Aside from these observations concerning them, the Australian and New Zealand laws are not covered in this article.

The laws of the other countries are grouped as follows according to the general type of legislation in practice: Laws in which industries covered are specified are those of Austria, Czecho-Slovakia, Denmark, Ecuador, Finland, Luxemburg, Netherlands, Poland, Portugal, Russia, the Kingdom of the Serbs, Croats, and Slovenes; Sweden, Switzerland, and Uruguay. Laws in which industries covered are determined in detail by administrative orders are those of France, Norway, and Spain.

Hours of Work Defined.

ALL the laws define the hours of work as the actual hours of work excluding rest periods.

The Peace Treaty, in Part XIII, defining labor standards, declared for the 8-hour day *or* 48-hour week as alternatives. The international convention drafted by the International Labor Conference used the term "8-hour day *and* 48-hour week," thus defining the working period in terms of both daily and weekly hours. The twofold method of definition, as against the alternative one, is obviously better calculated to prevent abuses in the application of the principle such as might take place if employees could be required to compress the whole 48 hours of the week into a period of days less than the number in the week. On the other hand the employers pointed to the greater

¹ See also report on the 8-hour day or 48-hour week, prepared by the organizing committee for the International Labor Conference, Washington, 1919 [London 1919], p. 5. Three types of laws are distinguished by this report, namely, the two mentioned above and the Australian arbitration-court laws.

flexibility in adjusting hours obtained by taking the week as the unit. The convention accepted what was in effect a compromise of the hard-and-fast rule, namely, a fairly liberal policy in respect to exceptions, and permitted the hours not worked on any weekday—hours less than the 8 prescribed—to be distributed over the remaining days of the week. The laws of the following countries accept either the day, or the day *and* the week, as the unit: Austria, Denmark, Ecuador, France, Germany, Luxemburg, Netherlands, Poland, Russia, and Uruguay. The following have adopted the 8-hour day *or* 48-hour week with the alternative form of definition: Finland, Norway (allows $8\frac{1}{2}$ hours per day on 5 days of the week), Portugal, the Kingdom of the Serbs, Croats, and Slovenes, and Sweden (allows $8\frac{1}{2}$ hours per day on 5 days of the week). Switzerland makes the week the unit in determining the hours. No limit is apparently placed on the day, except that in shift work the day may not exceed 9 hours.

Employees Included.

MOST of the laws include all persons employed in the industries covered by the acts, other than the members of a family. The international convention is specific and includes all departments of an industry so as not to discriminate between those who perform clerical work and the industrial workers in the same establishment. The laws, as near as may be determined without first-hand knowledge of administrative orders interpreting them, which cover only industrial workers are those of Austria, Czecho-Slovakia, Denmark, Germany, Russia, and Sweden. The last named is the only country which anticipates the international convention by specifically excluding persons in a managerial capacity and in positions of confidence. Laws covering only industrial workers naturally exclude this class. The laws of Czecho-Slovakia, Denmark, Netherlands, and Norway, which are likewise factory inspection laws of a general nature, make distinctions as to the hours of women, children, and adult male workers. The details can not be gone into in this analysis, which aims to cover only the general hours of work of adult males.

Industries Excluded.

IT is not possible to determine exactly the coverage of the laws. Either by express mention or by implication, certain industries and employments are excluded. The acts usually cover those undertakings which are included in the factory legislation of the country, and only a detailed first-hand study could determine the exact scope of the terms "factory" or "industrial undertaking." Consequently, a negative form of definition is probably more helpful than a positive one in order to determine the scope of the laws. All the laws, with

the exception of those of Ecuador, France, Poland, Portugal, the Kingdom of the Serbs, Croats, and Slovenes; Sweden, and Uruguay, exclude commercial and office employments. In some respects these laws set a higher standard than the international convention. Homework is universally excluded, as are all undertakings where only members of the family are employed. Agriculture is also generally excluded, except in the Czecho-Slovakian law, and in the Dutch law during periods other than the harvest season. The Danish law applies only to work in continuous industries and of all the laws is therefore the most limited in scope. Seasonal industries are either excluded entirely or are given special treatment in the exceptions allowed. Except in Sweden, where special laws exist for that class of work, public employments are included along with private undertakings.

Exceptions Permitted.

EVEN within the scope of the various laws certain exceptions are permitted to be supplied by administrative order. In determining these exceptions, it is customary to consult the organizations of workers and employers. The customary exceptions are either temporary or permanent exclusions of an industry or certain departments thereof. All the laws make temporary exceptions in the case of seasonal industries; also in case of exceptional pressure of work, as well as in the case of emergencies created by unforeseen accidents or force majeure. The law of Czecho-Slovakia, while including agriculture, makes exception in the distribution of the hours of work, spreading them over a period of four weeks so as to attain an average of 48 per week. France has a provision which is found in no other law, namely, that exception may be made in the case of an industry if an international agreement is entered into providing for different hours in the industry in question. Switzerland has the only act which contains a provision that an exception from the application of the 8-hour rule may be granted to an industry to enable it to meet the competition of countries working longer hours.

Overtime.

THE international convention is the most explicit as respects the provisions affecting overtime. Here the rate of overtime is definitely fixed at time and a quarter; the amount of overtime is subject to determination by agreement between the employers' and workers' organizations. The international convention further requires special authorization for working overtime and provides for the registration of the amount of overtime worked. Few of the national laws are as specific on this point. Those which provide for an extra rate of compensation for overtime are the laws of Austria, Ecuador, Finland, France, Poland, Portugal, and the Serbs, Croats,

and Slovenes. The amount of overtime is limited by the laws of the following countries: Austria, Finland, Netherlands, Russia, Sweden, and Switzerland. The laws in which registration of the amount of overtime is required are those of Finland, Poland, Russia, and the Serbs, Croats, and Slovenes. Those countries which have laws laying down the principle of an 8-hour day and leaving its application to administrative order make no detailed provision respecting overtime.

Administration.

THE general administration of the 8-hour laws is confided to the factory inspection departments and related services. The ordinary police authority and inferior courts try all cases of contravention under the law. Only one country, Peru, provides for the settlement of disputes as to wages arising from the application of the law, by an arbitration board composed of three members, two representing the parties and the third an arbitrator chairman chosen by the supreme court. No provision, however, is made as to enforcement of the award, although the arbitrators are required to report within eight days after assuming jurisdiction of the dispute. However, in this connection it should be noted that the majority of the other countries have arbitration and conciliation boards for the settlement of ordinary labor disputes so that the provision of the Peruvian law is not necessarily an advance on the 8-hour legislation of the other countries as far as the settlement of disputes is concerned.

Conclusion.

THIS brief study of the 8-hour laws of various countries has served to show the great diversity in the provisions which the laws lay down respecting the application of the 8-hour principle. Some are obviously extremely vague and limited in scope, others are pious wishes at the most. None are as definite or as comprehensive as the international convention adopted at the International Labor Conference in Washington (October 29–Nov. 29, 1919), the acceptance of which would in most countries constitute a distinct advance over the existing 8-hour laws.

Topical summaries of the 8-hour laws now in force in various foreign countries and of the international convention on the 8-hour day follow:

Topical Summaries of Eight-Hour Laws.

International Convention.¹

Date of adoption.—Conference of October 29, 1919; effective as to members ratifying it, July 1, 1921.

Hours of work defined.—Working hours shall not exceed 8 per day and 48 per week.

Persons included.—All persons other than members of family and those engaged in homework employed in undertakings specified.

¹ Reproduced in full in February issue of the MONTHLY LABOR REVIEW, pp. 15 to 20.

Industries covered.—Industries whether public or private include particularly mines, quarries, and other works for the extraction of minerals from the earth; establishments engaged in the manufacture, alteration, cleaning, repairing, ornamenting, finishing, adapting for sale, breaking up or demolishing, or transformation of materials; shipbuilding; generation and transmission of electric or motive power; construction and maintenance work in general; transportation, handling, and warehousing.

Reduction in wages.—No provision.

Exceptions.—Persons in a supervisory or managerial position, or confidential capacity; shift work, provided the average weekly hours for a period of 3 weeks do not exceed 48; accident, actual or threatened, urgent work to machinery or plant, or in case of force majeure when necessary to maintain ordinary work; certain conditions, when authorized by the Government, in which cases the average per week shall not exceed 48; certain occupations preliminary to and subsequent to beginning and stopping of work; unexpected demands upon the capacity of an establishment; national emergency. Special exceptions made as to time when becoming effective in case of certain Governments.

Not exceeding 56 hours per week in processes carried on under continuous operation.

Overtime.—Rate of compensation for overtime fixed at time and a quarter. Amount of overtime to be determined by administrative regulation and after consultation with employers' and workers' organizations.

Special orders.—Permanent and temporary orders may be issued by the Government after consultation with the organizations of employers and workers concerned, if such exist.

Administration.—Left to national authority, which will determine the appropriate agencies of enforcement.

Austria.

Date of enactment.—December 19, 1918; effective January 3, 1919. Continues in force until conclusion of peace.

Hours of work defined.—Hours of work shall not exceed 8 in 24, excluding breaks in work. For young people and women, 44 per week, and no work on Saturdays after 12 noon.

Persons included.—Industrial workers.

Industries covered.—All undertakings conducted by a corporation, State, Province, or commune, if operated as factories subject to the Industrial Code.

Reduction in wages.—No provision.

Exceptions.—When necessary to make up for unforeseen interruption not periodically recurring; press of work, especially in seasonal industries; in cases of collective contracts calling for a maximum of 48 hours per week; subsidiary processes (heating boilers, cleaning, etc.), provided young people are not so employed.

Overtime.—Overtime work paid for at 150 per cent normal wages; limited to 2 hours per day and not exceeding 3 weeks.

Special orders.—May allow further exceptions, after consultation with an advisory board on which employers and workers are equally represented.

Administration.—Factory inspection service and police authorities connected therewith. Contraventions are subject to the penal provisions of the Industrial Code.

Czecho-Slovakia.¹

Date of enactment.—December 9, 1918.

Hours of work defined.—Actual hours of labor limited to 8 per day and 48 per week.

Persons included.—Workers.

¹ The Czecho-Slovakian law is also a general factory act and includes provisions affecting the employment of women and children, night work, rest periods, etc.

Industries covered.—Industrial undertakings, whether public or private, or conducted for profit, philanthropic or charitable purposes; mining, coke ovens, and blast furnaces, agriculture and lumbering, provided they are run as enterprises by hired labor; transportation.

These provisions may not be evaded by giving out homework.

Reduction in wages.—Prohibited if based on decrease in actual hours worked.

Exceptions.—In particular classes of undertakings, especially transport and agriculture, the hours may be spread differently over a period for 4 weeks, the total therein not to exceed 192 hours; one-half hour for ascent and descent allowed in mines; where work is by shifts; force majeure, accidents, extraordinary demand, when other means are not practical; emergency work or repair work when life, health, or public interests are in danger; fixing of boilers, cleaning of workrooms, feeding animals, etc.; public utility establishments not requiring over 6 hours of work per day.

Overtime.—All overtime work separately paid for, rate not stated. Excluding emergency work, the maximum amount of overtime is 2 hours per day within a period of 20 weeks or 240 hours per year.

Special orders.—Required for overtime work, except for emergency and preparatory work, work when life, health or public interest is at stake. In special cases, in railroad work extra hours may not be required unless the minister previously consults workers' representatives.

Administration.—Ministry of Social Welfare and its subordinate, factory and mine-inspection service, the railroad administration, and local and municipal police authorities.

Denmark.

Date of enactment.—February 12, 1919; in effect, August 12, 1919.

Hours of work defined.—No worker in continuous operation may have gross hours of labor in excess of 8 per day, or more than 160 hours in 3 weeks; 16 hours at change of shifts permissible.

Persons included.—Workers in establishments covered.

Industries covered.—Industries regularly operated continuously; seasonal industries with four months of continuous process work.

Reduction in wages.—No provision.

Exceptions.—On change of shift days hours may be extended to 16; seasonal industries for four months in any year; repair work, sickness, or for completion of a specific job.

Overtime.—No provision.

Special orders.—Required in case of seasonal industries covered and after consultation with employers' and workers' organizations.

Administration.—Minister of labor and subordinate factory inspection service; advisory labor council representing employers and workers equally and under chairmanship of State official.

Ecuador.

Date of enactment.—September 11, 1916.

Hours of work defined.—Not more than eight hours daily, six days a week.

Persons included.—Laborers, mechanics, employees.

Industries covered.—Commercial establishments, offices, industrial enterprises, and in general any business whatever the nature of the services rendered.

Reduction in wages.—No provision.

Exceptions.—Laborers, mechanics, clerks, etc., may work beyond the legal limit upon request.

Overtime.—Overtime, before 6 p. m. is paid 20 per cent extra; between 6 and 12 p. m., 50 per cent, and after the last-named hour 100 per cent.

Special orders.—No provision.

Administration.—Judges of police court and parish justices try suits under act.

Finland.

Date of enactment.—November 27, 1917, amended August 14, 1918; administrative orders, August 19, 1918.

Hours of work defined.—Actual work not to exceed 8 hours per day (bank to bank in mining), or 96 hours in 2 weeks.

Persons included.—All persons in industries and undertakings mentioned, other than owner and members of his family.

Industries covered.—Whether public or private or conducted for profit or philanthropic purposes, handicrafts, factory or other industrial occupations, building, repair, and upkeep of buildings, and construction of docks, railways, bridges, roads, etc., salvage, and diving; bathing establishments; clearing, cleaning, draining, and scavenging; rafting and lumbering; loading and unloading; commercial, office, or warehouse work; inns, hotels, cafés, and similar industries; railway and street traffic, except traffic and rail sections; postal, customs, telephonic service, canals, except traffic sections; automobile traffic and jobbing; industries and undertakings similar to the above.

Reduction in wages.—No provision.

Exceptions.—In case of accident, force majeure, or other occurrence threatening to interrupt work or cause damage, such extra work not included in the regularly allowed overtime; establishments where work requires to be carried on uninterruptedly day and night: (a) 156 hours in 3 weeks with suspension on Sunday; (b) 168 hours in 3 weeks without such suspension (Senate decree, Aug. 19, 1918); subsidiary work in cleaning, repairing, heating, etc.

Overtime.—Overtime rate of time and a half for the first 2 hours, and double time for subsequent hours; amount of overtime not to exceed 24 hours in 2 weeks, and over 350 hours per year. Consent of inspection authorities required for overtime beyond 200 hours a year; registration and account of all overtime required.

Special orders.—Defining in detail exemptions from the law if, owing to the technical nature of the work, the time of year, or the compelling circumstances, the act can not be applied in practice.

Administration.—Department of Social Welfare and the subordinate factory inspection service, together with local police authorities.

France.

Date of enactment.—April 23, 1919 (forms Title I of Book II of the Labor Code).

Hours of work defined.—Actual hours of work limited to 8 per day or 48 per week.

Persons included defined.—Any age or sex, whether wage earners or salaried persons.

Industries covered.—Industrial and commercial establishments, including all departments thereof; both private and public undertakings whether of a religious, educational, charitable or philanthropic nature.

Reduction in wages.—No reduction in wages allowed as result of shortening hours through law.

Exceptions.—Left to administrative order for determination in general. Subject to revision if contrary to international agreements entered into.

Overtime.—Left to administrative order for determination.

Special orders.—Terms of law applied through administrative orders which apply either to a trade or locality or both. These will determine distribution of hours within week or other period, temporary and permanent exceptions, rest periods. Consultation with employers and workers required in advance of promulgation of orders or decrees.

Administration.—Ministry of Labor and subordinate factory inspection service.

Germany.¹

Date of enactment.—November 23, 1918; effective upon publication.

Hours of work defined.—Regular daily hours of labor, exclusive of rest periods, must not exceed eight. Curtailment on days preceding Sundays and holidays may be made up on other working days.

Persons included.—Industrial workers.

Industries covered.—All industrial establishments, inclusive of mining; Federal, State, and communal establishments, and agricultural subsidiary establishments of an industrial nature.

Reduction in wages.—No provision.

Exceptions.—General exceptions in transportation and communication (railway, post and telegraph service) subject to agreements between managers and workmen's organization; shift changes (permitting a 16-hour day once in 3 weeks); temporary emergency work not permitting delay; if public interest or nature of work requires uninterrupted work, provided labor can not be secured.

Special orders.—Factory inspection may authorize exceptions. Any hours of labor differing from the above must be in consequence of agreements, subject to approval of administrative officials.

Administration.—Department of Labor, factory and mine inspection services, and local police authorities.

Luxemburg.

Date of enactment.—December 14, 1918, administrative decree, December 14, 1918; effective December 15, 1918. Temporary, duration not specified.

Hours of work defined.—Actual duration of hours of work shall not provisionally exceed eight per day.

Persons included.—All employees in the classes of establishments enumerated below.

Industries covered.—Mines, clay-pits, quarries; iron and steel works and factories, establishments classed as dangerous, unhealthful, or noxious; factories employing steam or other mechanical motive power; public and private establishments, including those established for the purpose of industrial education or philanthropic purposes.

Reduction in wages.—Reduction of wages because of a reduction in hours is prohibited.

Exceptions.—Railroad transportation; work under direction of family authority, when not classed as dangerous or unhealthful or as not requiring heavy manual labor, and if steam or other mechanical power is not employed; handicraft and small industries employing less than 20 persons.

Special orders.—Exemptions, whether in general or for a limited time, may be authorized on special grounds.

Administration.—Ministry of Agriculture, Industry, and Commerce and subordinate factory inspection service.

Netherlands.²

Date of enactment.—Not ascertained; effective November 1, 1919.

Hours of work defined.—Actual hours of work per day not to exceed 8 hours per day and 45 per week.

Persons included.—All persons employed in factories, workshops, and offices.

¹ Full translation of the text of the order was published in the MONTHLY LABOR REVIEW, May, 1919, pp. 214, 215.

² Summary made from report on 8-hour day and 48-hour week, prepared by the organizing committee of the International Labor Conference, Washington, 1919. [London, 1919.] This law is more than an hours-of-labor regulation and applies also to the employment of women and children, age of admission to industry, etc.

Industries covered.—All industries except domestic service, agriculture during other than harvest seasons, and those for which other laws are applicable—stonecutters, harbor workers, mine workers, tramway and railroad transportation employees.

Reduction in wages.—No provision.

Exceptions.—Work of preparation and of cleaning up in factories, etc., allowed up to 10 hours per day; caretakers permitted to work up to 13 hours per day and 78 hours per week; seasonal industries; general exception for certain factories and workshops specified by order.

Overtime.—Amount of overtime generally limited to 2 hours per day and 7 hours per week; special order may permit 1 hour daily for 5 days per week as a regular rule in designated factories; seasonal industries, maximum hours limited to 11 hours per day for adult males (10 for women) and 62 per week (55 for women). Instances of overtime in any establishment are not to exceed 24 each year except in case of seasonal industries and like pressure of work, and provided only part of factory was affected by previously granted permits.

Special orders.—Allow exceptions and relaxations of the law, for certain establishments or classes of establishments.

Administration.—Department of Labor and subordinate factory inspection service; police and local authorities of various kinds.

Norway.

Date of enactment.—August 14, 1918; in effect on publication; continues in force 12 months after declaration of peace.

Hours of work defined.—General hours of work shall not exceed 8½ per day and 48 per week.

Persons included.—All workers in establishments designated by Crown.

Industries covered.—All industries covered by Factory Act of 1915 as follows: Handicraft and industrial establishments having the character of a factory, employing other than hand power or steam boilers, and not employing motors of 1 horsepower or over; quarries, clay and chalk pits; stone dressing employing five or more persons regularly; mines, ore dressing, and smelting works; mining and smelting; works manufacturing or using explosives; handicraft or other industrial occupations employing five or more persons outside of the workman's home; ice cutting, warehousing, packing, stevedores, etc.; building trades, water, gas, and sewer constructions; bridge building; construction of roads, railways, harbors; telegraph and telephone installations, etc.

Reduction in wages.—No provision.

Exceptions.—Extraordinary circumstances, provided authorization is secured.

Overtime.—In extraordinary circumstances by authorization.

Special orders.—Designate establishments to be governed by act.

Administration.—Ministry of Labor and subordinate factory inspection service. Special wage board of five members selected by Crown to settle disputes as to wage changes arising under the law.

Panama.

Date of enactment.—Not ascertained.¹

Hours of work defined.—Eight hours of work constitute a day's work.

Persons included.—All workers and commercial employees.

Industries covered.—All private and public undertakings whether industrial or commercial in their nature.

Reduction in wages.—No provision.

Exceptions.—Cases of urgent necessity; continuous processes; interruption likely to cause injury to interests of the public and of health; natural occurrences.

¹ Summary made from report on the 8-hour day and the 48-hour week prepared by the organizing committee for the International Labor Conference, Washington, 1919. [London, 1919.]

Overtime.—All work beyond hours stipulated is overtime and to be "remunerated accordingly." Permitted by special agreements between workers and employers.

Administration.—No provision.

Peru.

Date of enactment.—January 15, 1919 (decree by president).

Hours of work defined.—A day's work is fixed at eight hours.

Persons included.—All persons employed in industries covered.

Industries covered.—State workshops, railways, agriculture and industrial establishments, and all public works undertaken by the State. Private establishments unless otherwise agreed upon by employers and workers.

Reduction in wages.—Present wages to continue without change through reduction in hours.

Exceptions.—No provision.

Special orders.—No provision.

Administration.—Disputes as to wages arising from the application of this law, adjusted by an arbitration board of three members, two representing the parties and the third an impartial chairman chosen by the supreme court. Arbitrators must report in eight days. No provision as to enforcement of an award.

Poland.

Date of enactment.—November 23, 1918; in effect upon publication.

Hours of work defined.—Hours of labor must be limited to 8 hours daily and on Saturdays to 6 hours, exclusive of rest periods. When daily hours necessarily exceed 8 not more than 46 per week permitted.

Persons included.—All workers and employees in industries covered.

Industries covered.—All industrial establishments, mines, furnaces, workplaces, transportation by land and by water, and commercial occupations.

Reduction in wages.—Reduction in wages as result of reduced hours prohibited.

Exceptions.—Permitted only upon special authority. The 6-hour day may be any week day when agreed to by the city or local council.

Overtime.—Compensated at a higher rate than normal. Voluntary overtime agreements must be ratified by the labor inspectors; authorization required for obligatory overtime.

Special orders.—Special regulations and explanations may be issued by minister of labor and public welfare.

Administration.—Ministry of Labor and Public Welfare and subordinate factory inspection service as soon as constituted; at present, police authorities.

Portugal.

Date of enactment.—May 7, 1919; in effect May 17, 1919.

Hours of work defined.—Maximum period of work limited to 8 hours per day or 48 per week; commercial and financial institutions 7 hours per day.

Persons included defined.—All classes of employees in undertakings covered.

Industries covered.—State employment, administrative, commercial and industrial undertakings; transportation.

Reduction of wages.—Reduction of wages as result of reduced hours prohibited.

Exceptions.—Agriculture and domestic service, including hotels, restaurants, etc.; national emergency, mobilization; accidents by fire, flood, explosion, grave disaster, force majeure; special cases when authorized. Barber shops and business houses may work four hours extra on Saturdays. In dangerous and unhealthful processes further reduction in hours permitted; and if impossible to arrange work in shifts.

Overtime.—Double pay, excepting when for the State and administrative bodies and paid for under existing regulations.

Special orders.—May regulate shift-work in transportation; fix the time of opening and closing industrial and commercial establishments, and time for recreation.

Administration.—Factory inspection service and police authorities.

Russia.¹

Date of enactment.—October 26 (Nov. 11), 1917.

Hours of work defined.—The working day not to exceed 8 hours a day and 48 hours a week, including the time necessary for cleaning machinery and clearing up the works.

Persons included.—All persons working as wage earners in industries covered.

Industries covered.—All commercial and productive establishments regardless of their size and legal status.

Reduction in wages.—No provision.

Exceptions.—Night or seasonal work to satisfy public needs; preparatory work and work after the regular hours of an establishment; preservation of raw materials; danger to persons or property: water and light supply plants, heating, canalization and important public means of communication; necessary repair work; prevention of injury to machines, apparatus, etc., which might cause cessation of work; repair of damage by flood or fire: watchmen, guards, etc.

Overtime.—Double time rate; limited to 50 days in the year and to 4 hours in any two consecutive days: authorization required in most instances, and record of amount kept in all instances.

Special orders.—Required in case of exceptions covering unavoidable necessity and in restricting hours in dangerous and unhealthful occupations.

Consultation with employers and workers necessary for designation of certain holidays and permitting suspension of the law during hostilities.

Administration.—General administration of factories and mines.

Serbs, Croats, and Slovenes (Jugo-Slavia).

Date of enactment.—September 12, 1919; in effect one month after publication.

Hours of work defined.—Regular hours of labor, exclusive of rest periods, may not exceed 8 hours per day or 48 hours per week.

Persons included.—All employees in the classes of establishments covered.

Industries covered.—All industrial and handicraft establishments, mines, mercantile and transportation enterprises, whether privately or State owned, and establishments of an industrial character in agriculture and forestry.

Reduction in wages.—No provision.

Exceptions.—(1) Home-working establishments in which only members of the family of the entrepreneur are employed; (2) establishments requiring continuous operation (16-hour day permitted for adult workers once in three weeks at shift change); (3) in case of unforeseen emergencies (with modification of the proper authorities); (4) on application, the proper authorities may issue permits for a 10-hour day or a 60-hour week for a duration of 4 weeks to individual establishments or individual departments of an establishment and to seasonal industrial and handicraft establishments (these permits may be renewed not more than 3 times in a calendar year and each time for a maximum of 4 weeks); (5) cases of force majeure; (6) auxiliary work on which the beginning or termination of operation is conditioned (cleaning, attendance of boilers, machines, etc.).

Overtime.—Overtime work paid at 150 per cent of normal wages. In case of piece-work wages the forty-eighth part of the weekly earnings to be considered as the normal hourly wage.

¹ The decree is more than an 8-hour regulation and is practically a comprehensive factory law covering also the employment of women and children and night work.

Special orders.—In transport and communication enterprises (railroads, mails, telegraph, telephone, traction and steamship companies, etc.) the law is to be applicable with such amendments as are required by the nature of these enterprises. Such amendments to be determined by the proper ministers in conjunction with the minister of social welfare.

Administration.—Ministry of social welfare, industrial and mining authorities or factory and mine inspection service or political authorities.

Spain.

Date of enactment.—April 3, 1919; in effect October 1, 1919.

Hours of work defined.—The legal maximum hours of labor shall not exceed 8 per day or 48 per week.

Persons included.—All persons employed in industries covered.

Industries covered.—All industries until exceptions have been determined by administrative order.

Reduction in wages.—No provision.

Exceptions.—Determined by administrative orders to be issued not later than January 1, 1920.

Special orders.—Determine scope of law; consultation with committee representing workers and employers provided for.

Administration.—Institute of Social Reform and subordinate factory inspection service and various police authorities; advisory committees of employers and workers.

Sweden.

Date of enactment.—October 17, 1919; in effect January 1, 1920 (July 1, 1920, in case of continuous processes); operative until December 31, 1923.

Hours of work defined.—Actual hours of work exclusive of rest periods generally limited to 8 per day or 48 per week; but without exceeding the weekly limit, 8½ hour permissible the first five days of the week.

Persons included.—All employees except (a) persons in managerial positions; (b) persons doing secretarial or clerical work; (c) watchmen and (d) office employees.

Industries covered.—(1) All establishments, industrial and nonindustrial, private or municipal, employing four or more persons or located in community of over 1,500 inhabitants; (2) building construction work of every kind, provided that four persons are employed. Industries or work excluded are (1) Homework and work by members of family; (2) work of irregular or casual nature; (3) State establishments; (4) care of sick; (5) seamen, etc.; (6) forestry and lumbering; (7) agriculture and related industries; (8) transportation by rail; (9) stores, barber shops, and related establishments; (10) hotels, restaurants, etc.

Reduction in wages.—No provision.

Exceptions.—Allowed by the advisory council representing employers and workers. National emergencies may occasion overtime; work in shifts may exceed the weekly limit of 48 hours, provided the average over a period of three weeks does not exceed 48 hours. In seasonal and other trades the average of 48 hours may be prorated over a period not exceeding four weeks. In case of industrial emergencies, such as work to prevent accidents and spoiling of perishable products, work in excess of the legal limits is permitted. Undertakings which may find it necessary to close down if compelled to accept the 8-hour day may be allowed to defer the introduction of the 8-hour day upon orders by the Crown after advice of the labor council created.

Overtime.—Amount of overtime limited to 25 hours per month, and 150 hours per year for adult workers (18 years and over) and 10 hours per month in the case of young persons. Further overtime of 10 hours per month and 75 hours per year permitted by

¹ Covered by special law October, 1919. See MONTHLY LABOR REVIEW, December, 1919, pp. 258-260.

authority of factory inspector. Details respecting overtime left to collective agreements.

Special orders.—Define and limit exceptions.

Administration.—Department of Labor and subordinate factory inspection service; police authorities, courts, etc. Special advisory council representing employers and workers set up for advice in drafting regulations, etc.

Switzerland.

Date of enactment.—June 27, 1919.

Hours of work defined.—Single-shift work not to exceed 48 hours per week; if hours on Saturday are less than 8, remaining hours may be distributed over the 5 days of the week, so long as the week does not exceed 48 hours. Work at night (permitted by competent authority) not to exceed 8 hours, but in shift work it may be 9 hours.

Persons included.—All employees in industries and occupations covered.

Industries covered.—All factories or industrial establishments operated by machine power employing at least 6 persons; those not having machine power but employing at least 11 persons; those employing any persons under 18 years of age if at least 6 persons altogether are employed; establishments involving injurious or unhealthful processes.

Reduction in wages.—No provision.

Exceptions.—Allowed by competent authority in case of duly ascertained need; in case of preparatory work and work of cleaning, etc., after hours; if necessary to enable an industry to meet competition of countries working longer hours. Maximum of exception allowed is 52 hours per week.

Overtime.—Not over 2 hours per day except in case of duly ascertained need; nor for a period exceeding 10 days by district or local authority and over 10 days but not exceeding 20 days by cantonal authority, and not exceeding 24 days in general during the year. This limit may be exceeded by agreement between employers and workers in very exceptional cases (seasonal work), and if any previously issued permits have applied only to part of factory or some of the workers; but prolongation of day preceding Sundays and holidays is permitted only in case of duly ascertained need which must not lie in nature of the industry.

Special orders.—Define amount of overtime and rest periods and extent of exceptions permitted.

Administration.—Department of Industry and Commerce and the subordinate factory inspection service.

Uruguay.¹

Date of enactment.—November 17, 1915; effective February 17, 1916.

Hours of work defined.—Actual work 8 hours per day and 48 hours per week.

Persons included.—All employees in industries covered.

Industries covered.—Any factory, workshop, shipyard, stoneyard, earthworks, harbors on coasts or rivers, industrial and commercial establishments, railroads, street railway service, loading or unloading ships, and on public works.

Reduction in wages.—No provision.

Exceptions.—Such as are granted by special authorization; affect only daily hours; weekly hours may exceed 48.

Overtime.—No provision as to rate, amount, or kind.

Special orders.—The executive authority may permit extension of the daily hours in exceptional cases.

Administration.—Treasury department, the factory inspection service, and police authorities.

¹ Law summarized in the MONTHLY REVIEW for April, 1916, pp. 84, 85.

Profiteering Act of Great Britain.

IN AUGUST last the British Parliament passed a measure to be cited as "the Profiteering Act, 1919." It provides for investigation of complaints by the Board of Trade, which may also establish local committees for the handling of matters arising in the locality. The subjects to be investigated are prices, costs, and profits at all stages, and also complaints as to unreasonable profits. The board or the local committee may either dismiss the complaint on hearing, or declare the price that would yield a reasonable profit and require the return of the excess charged above such price. Violations may be punished by fine and imprisonment; false and reckless complaints also entail liability of similar punishment.

Articles covered include those designated by the Board of Trade, "being an article or class of articles declared by the order to be one or one of a kind in common use by the public, or being material, machinery, or accessories used in the production thereof." Articles subjected to other regulations, known as "controlled articles," are exempt from the provisions of this act, as are also goods for export or sales at public auction or on competitive tender. The Board of Trade has power to make regulations for the carrying out of the purposes of the act and the government of local committees. These committees may exercise in general the powers of the board except as regards the fixing of prices. Appeals may be taken to tribunals to which the decisions of local committees may be referred, and either the local committee or the appeal tribunal may refer cases to the court of summary jurisdiction for the prosecution of offenders.

The Board of Trade may take action by way of investigation on its own initiative, and is directed to do so as regards trusts, combinations, etc., connected with the regulation of prices or the production of commodities. Local committees will proceed normally on complaints submitted to them, the regulations requiring such complaints to be made within 4 days after the transaction, though this period may be extended by the local committee to not later than 14 days. Proceedings are to be public and reports of the evidence and sentences are to be published in the local press. As a further means of reducing the cost of living the Board of Trade may authorize local authorities to purchase and sell any article or articles to which this act applies, subject to such conditions as the board may impose. This business is to be carried on on a commercial basis, however, and not at public expense.

It is reported that the Board of Trade has received a large number of replies from local authorities accepting their invitation to form local committees under the act; these committees are to consist of

not less than 7 nor more than 25 members, and the working classes must be adequately represented thereon. The act itself directs the inclusion of women on all local committees.

The first schedule issued by the board, of articles to be included, contains a list of all articles of wearing apparel, all household utensils and necessities, and all material required in building; the second schedule deals with all articles of food which are not controlled. At the end of about one month from date of the enactment of the law it was reported that 900 local committees had been formed, and that appeal tribunals were being organized at such a rate that the whole country would soon be covered.

Considerable criticism of the act has been expressed. It is regarded by some as an effort to deal with trivial offenders on the complaint of persons whose names will become known to the dealers, and who will thereby incur their dislike to an extent that may cause much inconvenience, particularly in small communities. On the other hand the fault may really lie back of the dealer complained of, who is only obtaining a reasonable profit based on the high price that he was compelled to pay. The machinery is felt to be poorly coordinated and unlikely to reach effectively the real seat of the trouble. However, it is admitted that a valuable effect may be produced by the fact that a penal provision is in existence, potentially available in case of discovered extortion. The life of the act is limited to six months unless specifically extended by provision of Parliament.

Summary of Labor Legislation in Great Britain in 1919.

THE British Labor Gazette for January, 1920, publishes the following summary of labor legislation enacted in that country during the year 1919. It should be noted that the provisions of some of these measures have been given in previous issues of the MONTHLY LABOR REVIEW.

Two acts dealt with questions of wages. The Wages (Temporary Regulation) Extension Act (May 29)¹ extended for six months, until November 21, 1919, the provisions of the Wages (Temporary Regulation) Act, 1918. Until that date, therefore, the statutory obligation was imposed upon employers of paying not less than the "prescribed" rates of wages, which, broadly speaking, were the standard district rates existing at the time of the armistice. Compulsory reference to the interim court of arbitration at the request of one of the parties was also maintained in case of difference as to the existence or the amount of a prescribed rate; and in the case of women's wages, where the rate could not be easily ascertained, the Minister of Labor retained power to fix a prescribed rate by order. In addition, a rate might be substituted for the pre-

¹ The dates given after the title of acts are those of the royal assent.

scribed rate by an award of the interim court of arbitration on compulsory reference, or by an agreement approved by the Minister of Labor; and these "substituted" rates might be extended by order to the whole of the industry concerned. The Industrial Courts Act¹ (November 20) extended until September 30, 1920, certain of the main provisions of the wages (temporary regulation) acts. Statutory sanction was given to the prescribed or substituted rate in existence at the expiration of the Wages (Temporary Regulation) Act, and to the decisions as to the existence and amount of such rates given by the industrial court established in place of the interim court of arbitration.

But, except in certain circumstances in the case of women, it is no longer possible to establish a new prescribed or substituted rate having statutory authority; and the power to extend by order substituted rates, fixed by agreement, to the whole of an industry has also ceased to exist.

The Industrial Courts Act provides also a permanent supplement to the existent machinery for conciliation and arbitration. Reference may be made to the industrial court, by agreement of both parties, in regard to any matter relating to or arising out of a dispute. This step may only be taken when other means of settlement have been brought into operation without success. Other forms of arbitration tribunals than the industrial court continue, and, if both parties to a dispute desire it, can still be utilized. The act also makes provision for the full information of the Government and the public as to the facts in a trade dispute, by authorizing the Minister of Labor to set up, in case of a dispute, actual or anticipated, a court of inquiry, with authority to demand evidence and to issue a report.

The problems of employment in the coal industry gave rise during the year to two acts. The Coal Industry Commission Act (February 26) provided that a commission² should be constituted to inquire into the position of and conditions prevailing in the industry, with special reference *inter alia* to wages, hours of work, cost of production and distribution, selling prices and profits, and the social conditions of colliery workers. The Coal Mines Act, 1919 (August 15), provided, in accordance with the interim report of the commission, for the reduction, from eight to seven, of hours of labor of coal mine workers below ground as from July 16, 1919, and makes provision, contingent upon the conditions of the industry, for a further reduction in 1921.

Two acts dealt with special problems arising from war conditions. The Restoration of Prewar Practices Act³ (August 15) redeems the pledges given to trade-unions in return for their withdrawal of restrictive practices during the war. It requires owners of establishments to which the act applies—mainly those engaged on munitions work—to restore or permit the restoration of any trade rules, practices, or customs obtaining before the war which had been departed from during and in consequence of the war, and to permit the continuance of such trade practices for one year. The Disabled Men (Facilities for Employment) Act (July 22) enables arrangements to be made to relieve or indemnify employers in respect of the whole or part of any increase of expenditure arising from his liability to pay compensation in respect of accidents or industrial disease, where such increase is attributable to the employment of men disabled in the war. The act, which is administered by the Home Office, is given effect, in general, by agreements entered into with the insurance companies, who accept disabled men at the ordinary rates, and are indemnified by the Government against extra expenditure.

Four acts amended previous legislation providing for social services. The National Health Insurance Act, 1919 (August 15), increases from £160 to £250 per annum the rate

¹ This act was published in the MONTHLY LABOR REVIEW for February, 1920 (pp. 41-45).

² Articles dealing with the appointment and reports of this commission were published in the MONTHLY LABOR REVIEW for May, 1919 (pp. 109-114), August, 1919 (pp. 78-86), and October, 1919 (pp. 23-30).

³ An account of the introduction of this bill, its important features, and the attitude of unskilled labor toward it, was given in the MONTHLY LABOR REVIEW for October, 1919 (pp. 30-35).

of remuneration for the purpose of exemption from insurance under the national health insurance acts. The National Insurance (Unemployment) Act (December 23) raises from 7s. to 11s. per week the rate of benefit payable to workpeople insured under the National Insurance (Unemployment) Acts, 1911-1918. The Workmen's Compensation (War Addition) Amendment Act¹ (December 23) increases the additional weekly sum from one-quarter to three-quarters of the amount of the weekly payment, and also extends the application of the act of 1917, as amended, to persons entitled to compensation under the acts of 1897 and 1900. The Old Age Pensions Act¹ (December 23) increases the weekly rates of old-age pensions, the new maximum being 10s. per week, and makes various other provisions and amendments to earlier acts.

The Checkweighing in Various Industries Act² (August 15) provides for "checking the weight or measurement of materials produced, handled, or gotten by workmen paid by weight or measure in certain industries," including the production or manufacture of iron or steel, the loading or unloading of goods into or from vessels, the getting of chalk or limestone from quarries, and the manufacture of cement and lime. Provision is made for the inclusion of other materials by regulation.

The Police Act (August 15) constituted the police federation, and prohibits members of police forces from being members of trade-unions.³

In addition to the acts mentioned above, bills have been introduced by the Minister of Labor providing for (a) the establishment of a maximum working week of 48 hours, subject to certain exceptions; (b) the constitution of a commission to inquire into and report on minimum time rates of wages; (c) the extension of the contributory scheme of unemployment insurance to substantially all persons falling within the health insurance scheme, except those engaged in agriculture and domestic service.⁴ These bills are to be dealt with in the next session of Parliament.

¹ This act is noted in this issue of the MONTHLY LABOR REVIEW (p. 181).

² This act was noted in the MONTHLY LABOR REVIEW for February, 1920 (pp. 238, 239).

³ This act applies to Great Britain only; a similar measure for Ireland was the Constabulary and Police (Ireland) Act, which received royal assent on November 20.

⁴ In Ireland the bill applies only to workmen in the trades now insured against unemployment.

LABOR ORGANIZATIONS.

Annual Convention of International Seamen's Union of America, January, 1920.

THE determination of the International Seamen's Union of America to defend and uphold the Seamen's Act against all attacks in Congress and in the courts, and to initiate an active counter propaganda against the campaign which the union alleges is being carried on to misrepresent and discredit the act, was strongly emphasized at the twenty-third annual convention of the union, which was held in San Francisco, January 12-22, of this year.¹ The convention went on record as being opposed to any and all amendments intended to bring about a repeal of the law and empowered its legislative committee to take any action it may deem necessary to preserve the law.

In his annual address to the convention, President Andrew Furuseth spoke of the struggles of the seamen to attain their present position and to defeat the campaign to nullify or repeal the Seamen's Act. Criticism was voiced of some of the rulings made by the Department of Commerce in the enforcement of the act, although Mr. Furuseth stated that "the trouble is more in the system that places the material of the merchant marine—the vessel—under the same department with the personnel—the seamen." He urged indorsement by the convention of the recommendation of the Secretary of Labor to Congress that jurisdiction of the personnel of the merchant marine be transferred to the Department of Labor, and also of the bill drafted by authority of the executive board of the union for submission to Congress providing for such transfer. The convention subsequently acted favorably upon a resolution to this effect and providing "that the legislative committee be instructed to consult with the Secretary of Labor, with the Masters, Mates, and Pilots of the United States, and the Marine Engineers' Benevolent Association to the end that we may, if possible, be united by the final form of the bill before it is introduced."

President Furuseth pointed out the potential danger to the seamen's act from the labor clause in the covenant of the League of Nations and to the hostile attitude of foreign shipowners. The friendly attitude of the organized seamen of Europe toward the act and the enactment of similar legislation in Scandinavian and other

¹ Report summarized from *The Seamen's Journal*, San Francisco, Jan. 14, 21, 28, 1920.

maritime nations were referred to in showing the need of close affiliation with the International Seafarers' Federation in order to advance the interests of all seamen. He said:

To accomplish our purpose we must be associated with the seamen of the world and send delegates to the gatherings of the representatives of the seamen from different countries. We need them. They need us. We all need the strength that comes from knowing each other, and the help that we can give to each other industrially and legislatively. We must all become free, or we shall again all become slaves.

The convention later decided to send three delegates to the next conference of the International Seafarers' Federation which will be held in Europe this summer, and "to cooperate with the organized seamen of all countries in securing for them the rights conferred to seamen under the American flag by the Seamen's Charter of Freedom, the Seamen's Act."

Work of the Convention.

MORE than two days of the convention's time was devoted to a thorough discussion of the problems confronting the seamen of America and at the conclusion of the deliberation a recommendation was made to all affiliated unions that, in view of the very unsettled industrial conditions, they give most careful and painstaking consideration to all movements either to advance or lower existing wages and working rules. Unqualified indorsement was given to the principle of the eight-hour working day for all seamen, and a resolution was passed approving the action of the Railroad Administration in recognizing the fundamental right of the 48-hour week and time and one-half as overtime for any work done in excess thereof, but protesting against the exclusion of that class of employees called "marine workers of floating equipment department." It was decided to work for the early enactment of the Federal seamen's compensation bill, now pending in the United States Senate, to urge Congress to abolish the present recruiting and training service of the Shipping Board and instead make every merchant ship a training vessel for American youths, and to favor private ownership and operation of merchant vessels "because Government ownership of ships has had the tendency to establish Government ownership of seamen." The convention disapproved of the Rowe bill which has passed the House and is now in the Senate and which would amend the law so that a person might become an able seaman after serving six weeks in a training vessel or by passing the examination required after six weeks of such training and serving nine months in a merchant vessel. The present law permits any person who has been at sea for one year to become an able seaman upon passing an examination proving his fitness for the rating. The proposed law was said to be "vicious," and in the resolution adopted it was held that "no man can learn an

able seaman's duties in such short time" and that "it is the real interest of the safety at sea and our ability to compete that the efficiency [of the seamen] be increased in place of being decreased."

The convention decided to establish permanent offices for the union at Washington, D. C., and to continue organizing work in the ports of the United States and Canada and particularly on the Great Lakes until every seaman and fisherman is a member of the union. The report of the secretary showed the membership of the union to have increased from 50,000 in 1918 to 75,000 in 1919.

By occupation groups the membership was reported as follows:

MEMBERSHIP OF INTERNATIONAL SEAMEN'S UNION, 1918 AND 1919, BY OCCUPATION GROUP.

Occupation group.	1918	1919
Cooks.....	7,200	9,400
Fishermen.....	9,600	8,600
Firemen.....	14,700	27,000
Sailors.....	18,500	30,000
Total.....	50,000	75,000

By districts, in 1919, 48,000 were credited to the Atlantic district, 18,000 to the Pacific district, and 9,000 to the Great Lakes district. Approximately 50 per cent of the membership at the beginning of 1920 was native born, while just prior to the war the native-born membership was only 20 per cent. Andrew Furuseth was reelected president and T. A. Hanson secretary-treasurer for the coming year. Philadelphia was selected as the place for holding the next convention.

Activities of German Trade-Unions.

Membership of General Trade-Union Federation.

IN SEPTEMBER, 1919, the German General Trade-Union Federation, the central organization of the Free (Social-Democratic) Trade-Unions, had a membership of approximately 6,400,000 organized in 54 federations.¹ Of these 5,327,000, or about five-sixth of the total, belong to 12 federations, each of which has 100,000 or more members.

FEDERATIONS OF THE GERMAN FREE TRADE-UNIONS WITH A MEMBERSHIP OF 100,000 OR OVER IN SEPTEMBER, 1919.

Federation.	Membership.	
	Before the war.	In September, 1919.
Metal workers.....	531,991	1,350,000
Factory workers.....	207,330	506,000
Transport workers.....	228,207	450,000
Mine workers.....	101,956	422,600
Railwaymen.....		420,000
Building trades.....	309,562	400,000
Agricultural workers.....	22,531	400,000
Textile workers.....	133,034	370,000
Salaried employees.....	35,219	350,000
Wood workers.....	192,465	310,000
Municipal workers.....	54,522	250,000
Tailors.....	49,145	100,000
Total.....	1,855,962	5,327,000

With respect to the membership figures given in the preceding table it should be noted that the railwaymen's federation was not established until July, 1916, and that the salaried employees' federation was formed in 1919 by the amalgamation of two other federations.

Commenting on the rapid growth of the membership of the Free Trade-Unions an article in *Correspondenzblatt*² says:

German Free Trade-Union membership is making rapid strides from the sixth into the seventh million. Considerably more than half of the members are persons who have joined a trade-union for the first time. These must be trained to be good trade-unionists. This training has for many years been the task of the trade-unions, but it has never been so big and difficult a task as it is now. Hitherto the old members were in the majority in the local unions, the district councils, federations, and conferences. Now the new members are in the majority. The minority has to teach the majority. The new members have been in the trenches for four years, and their experiences have left a mark. They are not shy and retiring as new members were in the old days. The characteristic of the masses of the workers to-day is a deep-seated feeling of bitterness and mistrust toward everything and everybody. All this must be taken into consideration. New members must not be called "November Socialists" and must not be referred to as "those who have just crept into the organization." The youthfulness of the new members must not constitute a cause of reproach.

² *Correspondenzblatt.* Berlin, Sept. 13, 1919.

Metal Workers' Federation.

THE proceedings at the general conference of the Metal Workers' Federation held at Stuttgart in October were of great importance for the development of industrial conditions in Germany.¹ For the first time in the history of the federation the delegates belonging to the Independent (radical) Socialist Party gained the upper hand in this, the largest German trade-union federation, and appointed its representatives as leaders. This majority has declared itself against joint industrial leagues (*Arbeitsgemeinschaften*) of representatives of trade-unions and employers' associations. Its manifesto states that "the general conference recognizes no form of negotiations with employers other than those rendered necessary by industrial disputes." An Industrial Workers' Federation (*Industrieverband*), composed of all manual and brain workers in the metal industry, is to be formed, to continue the fight for the possession of the means of production and the abolition of capitalism.

The passing of the leadership of the Metal Workers' Federation into the hands of the Independents means, it is stated, that the joint industrial league in the metal industry has broken up, and that if this process is repeated in other trade-union federations, the existence of the central industrial league of workers' and employers' organizations will be threatened. The movement which aims at industrial dictatorship through the works' councils is undermining the practical beginnings made by the joint industrial leagues toward giving the workers an effective share in the control of production. The manifesto recognizes only those conferences with employers which are necessitated by industrial disputes, and excludes cooperation in productive tasks. The fact of the continued existence of capitalistic enterprise is thus recognized, but organized workers are deprived of the measure of participation in the control of production which they had gained. These leaders, it is added, are evidently afraid of developing the joint industrial leagues and cooperating with the employers. But they will find, after some practical experience as leaders of the unions, that they are obliged to cooperate in the control of production. The idea of the industrial joint league will be resuscitated in one form or another by its present opponents.

The *Metallarbeiter-Zeitung*² publishes the following excerpts from the new by-laws of the Metal Workers' Federation operative as from October 13, 1919:

Strike benefit.—First-class members (men), 5 marks³ per diem, or 30 marks weekly; second class (women 16 years of age and over), 3 marks, or 18 marks weekly; third

¹ Vorwärts. Berlin, Oct. 25, 1919.

² *Metallarbeiter-Zeitung*. Stuttgart, Nov. 15, 1919.

³ Owing to fluctuations in exchange value conversions into United States money are not made. The normal par value of the mark is 23.8 cents, and of the pfennig 0.238 cent.

class (children under 16 years of age), 2 marks, or 12 marks weekly. For their wives married members of the first class are to receive in addition 1 mark per diem, or 6 marks weekly, and of the second class, 50 pfennigs, or 3 marks. For each child at home, 50 pfennigs daily, or 3 marks weekly, is to be paid. Should the person have been a member for less than 26 weeks the strike benefit is to be: First class, 18; second class, 15; third class, 9 marks weekly; and for wives and children at home, 3 marks weekly. Operative as from December 28, 1919.

Initiation fee and contributions.—The initiation fee has been fixed at 1 mark for adult male members and at 50 pfennigs for women and for boys under 16 years of age. The weekly contribution is to be 1.20 marks for men, 60 pfennigs for women of 16 years and over, and 30 pfennigs for boys and girls under 16 years of age.

Traveling and removal benefit.—The traveling benefit is to be 2 marks per day. The removal benefit varies according to length of membership. Membership of from 52 to 156 weeks and removal to a locality distant 25 to 150 kilometers (15.5 to 93.2 miles) is allowed 40 marks, and above 150 kilometers (93.2 miles) 60 marks in the first class; in the second class, 20 and 30 marks, respectively, are allowed. When the period of membership exceeds 11 years, the amounts allowed for the same distances rise to 120 and 180 marks in the first class and 60 and 90 marks in the second class.

Unemployment and sick benefit.—Unemployment and sick benefit is granted for 20 weeks at rates varying according to length and class of membership. In class 1 the weekly benefit varies between 7 and 12 marks, in class 2 between 4.75 and 8 marks, and in class 3 between 3.50 and 6 marks.

Death benefit.—Death benefit is paid according to class and length of membership, as follows: Fifty-two weeks' membership entitles to 60, 30, and 13 marks, respectively, and after 11 years' membership the benefit reaches a maximum of 200, 100, and 50 marks.

Notice for offensive action.—Notice of at least one month must be given before any offensive action is taken. No stoppage of work may take place until the matter in dispute has been laid before the conciliation authority and not unless three-fourths of the members affected have voted for such cessation of work.

LABOR BUREAUS.

Organization of Massachusetts Department of Labor and Industries.

THE so-called consolidation act (Mass. Gen. Acts, 1919, ch. 350) provided for the organization in 20 departments of all of the executive and administrative functions of the Commonwealth, except such as pertain to the governor and council and such as are exercised and performed by officers serving directly under the governor and council. The functions of the new department of labor and industries (one of the 20 departments established by the act) comprise those formerly vested in the board of labor and industries, the bureau of statistics (in part), the board of conciliation and arbitration, the minimum wage commission, the commissioner of standards, and the surveyor of lumber.

The act provides that the department shall be under the supervision and control of a commissioner, to be known as the "commissioner of labor and industries," an assistant commissioner, who may be a woman, and three associate commissioners, one of whom shall be a representative of labor, and one a representative of employers of labor, all of whom shall be appointed by the governor with the advice and consent of the council. The commissioner is the executive and administrative head of the department and has charge of the administration and enforcement of all laws, rules, and regulations which it is the duty of the department to administer and enforce. He is also required (among other duties) to prepare, for the consideration of the associate commissioners, rules and regulations, in accordance with existing law, for the carrying out of the provisions of this act relative to the department, which rules must first be approved by the associate commissioners before becoming effective. In addition to acting in an advisory capacity the associate commissioners constitute a board to be known as the "board of conciliation and arbitration," which has the authority and exercises the functions heretofore vested in the board of conciliation and in the minimum wage commission, except as to matters of an administrative nature.

The act authorizes the commissioner to organize the department in such divisions as he may from time to time determine and to assign the officers and employees of the department thereto, and authorizes the commissioner and associate commissioners, with the approval of the governor and council, to appoint and fix the salaries of not

more than five directors, each of whom shall be assigned to take charge of a division of the department. The plan of organization as at present in effect and its directing personnel are as follows:

Commissioner of Labor and Industries: Gen. E. Leroy Sweetser.

Assistant Commissioner: Miss Ethel M. Johnson.

Associate Commissioners: Mr. Herbert R. Wasgatt; Mr. Edward Fisher; Mr. Samuel Ross.

Directors:

Division of Industrial Safety: Mr. John P. Meade, director.

Division of Statistics: Mr. Roswell F. Phelps, director.

Division of Standards: Maj. Francis Meredith, director.

United States Employment Service: Gen. E. Leroy Sweetser, federal director; Roswell F. Phelps, assistant federal director.

In the process of consolidation the function of the several boards, etc., now vested in the department of labor and industries were transferred in toto to the new department, except in the case of the former bureau of statistics, whose functions were distributed among three departments, as follows:

1. The duties of collecting, arranging, and publishing statistical information relative to the commercial and industrial conditions of the people, and the productive industries of the Commonwealth usually designated as the statistics of labor and manufactures, and the establishment and maintenance of public employment offices and all other duties not otherwise provided for by the act, were transferred to the department of labor and industries (section 69) and are now performed by the division of statistics of that department.

2. The duty of taking the decennial census of the Commonwealth and of collecting, compiling, and publishing information in connection therewith, and the duty of making the enumeration of summer residents of certain towns were transferred to the secretary of the commonwealth (section 25).

3. The duties of compiling municipal statistics, of auditing of municipal accounts, and of certifying notes of towns and districts were transferred to the department of corporations and taxation (section 52).

Although the former minimum wage commission, as such, was abolished by the consolidation act, its functions are now vested in the associate commissioners of the new department of labor and industries, who are authorized to establish wage boards, enter decrees, and issue special licenses as formerly done by the commission. When acting in this capacity, the associate commissioners and the assistant commissioner, who is in immediate charge of minimum wage matters, direct the work of the division of minimum wage.

With reference to the division of standards, it should be stated that the term "standards" has reference to weights and measures

and not to the industrial code. The functions of this division now embrace those of the former commissioner of standards and surveyor general of lumber.

Under the consolidation act the industrial accident board, which administers the workmen's compensation act in Massachusetts, is continued without change as a department entirely separate from the department of labor and industries, and certain former joint functions of these two departments are now vested in the latter department. Thus the law provides that the duties of factory inspection and accident prevention shall be performed by the department of labor and industries. The reporting of accidents, however, is made to the department of industrial accidents, which takes over the functions of the industrial accident board, and this department is the only source from which accident experience is available.

The following sections of the consolidation act (Mass. Gen. Acts, 1919, chap. 350, secs. 69-78) refer specifically to the organization of the department of labor and industries:

SECTION 69. The board of labor and industries, existing under authority of chapter 726 of the Acts of 1912 and acts in amendment thereof and in addition thereto; the board of conciliation and arbitration, existing under authority of chapter 514 of the Acts of 1909, as amended by chapter 681 of the Acts of 1914, and acts in amendment thereof and in addition thereto; the minimum wage commission existing under authority of chapter 706 of the Acts of 1912, and acts in amendment thereof and in addition thereto; the office of commissioner of standards, existing under authority of chapter 534 of the Acts of 1907 and of chapter 218 of the General Acts of 1918; and the office of surveyor general of lumber, existing under authority of chapter 60 of the Revised Laws, are hereby abolished. All the rights, powers, duties and obligations of the said boards, commissions and offices, or of any member or official thereof, and those of the bureau of statistics, or the director thereof, with respect to collecting, arranging, and publishing statistical information relative to the commercial and industrial condition of the people, and the productive industries of the Commonwealth, usually designated as the statistics of labor and manufactures, and with respect to the establishment and maintenance of public employment offices and with respect to all other matters not otherwise provided for by this act, are hereby transferred to and shall hereafter be exercised and performed by the department of labor and industries, established by this act, which shall be the lawful successor of said boards, commissions, and offices and of said bureau of statistics, and the director thereof, with respect to the said rights, powers, duties, and obligations. The powers and duties conferred and imposed upon the industrial accident board by section 18 of Part IV of chapter 751 of the Acts of 1911 are also transferred to and shall hereafter be exercised and performed by said department.

SEC. 70. The department of labor and industries shall be under the supervision and control of a commissioner, to be known as the commissioner of labor and industries, an assistant commissioner, who may be a woman, and three associate commissioners, one of whom shall be a representative of labor and one of whom shall be a representative of employers of labor, all of whom shall be appointed by the governor, with the advice and consent of the council. The first appointment of the commissioner and assistant commissioner shall be for the term of three years, and of the associate commissioners for the terms of one, two and three years, respectively. Thereafter as the terms expire the governor shall in like manner appoint the said commissioners for terms of three

years, shall fill any vacancy for the unexpired term, and may, with the consent of the council, remove any commissioner. The commissioner shall receive such annual salary not exceeding \$7,500, and the assistant commissioner and associate commissioners such annual salary, not exceeding \$4,000 each, as the governor and council may determine.

SEC. 71. The commissioner shall be the executive and administrative head of the department. He shall have charge of the administration and enforcement of all laws, rules, and regulations which it is the duty of the department to administer and enforce, and shall direct all inspections and investigations except as is otherwise provided herein. He may organize the department in such divisions as he may from time to time determine, and may assign the officers and employees of the department thereto. He shall prepare for the consideration of the associate commissioners, rules and regulations, in accordance with existing law, to carry out the provisions of this act relative to the department. All rules and regulations so prepared shall take effect, subject to the provisions of chapter 307 of the General Acts of 1917 where applicable, when approved by the associate commissioners, or upon such date as they may determine. The commissioner may designate an associate commissioner to discharge the duties of the commissioner during his absence or disability.

SEC. 72. The associate commissioners shall constitute a board to be known as the board of conciliation and arbitration, which shall have the authority and exercise the functions heretofore vested in the board of conciliation and arbitration and in the minimum wage commission, except as to matters of an administrative nature, and in pursuance of the said authority shall, if they deem it necessary, investigate immediately the circumstances of any industrial dispute which arises, shall establish wage boards and review their reports, and may issue special licenses under the provisions of section 9 of chapter 706 of the Acts of 1912. In all investigations and proceedings conducted by said associate commissioners they shall have authority to summon witnesses, to administer oaths, to take testimony and to require the production of books and documents. In any controversy referred to the board on a joint application under any arbitration agreement they shall employ special experts at the request of either party. One such expert shall be selected from a list furnished by each party to the controversy. The expense of such experts shall be borne by the Commonwealth. They shall be assigned such assistants from the officers and employees of the department as the commissioner and they shall from time to time determine. The fees of witnesses before the associate commissioners for attendance and travel shall be the same as those of witnesses before the superior court, and shall be certified and paid in accordance with the provisions of section 15 of chapter 514 of the Acts of 1909, and acts in amendment thereof and in addition thereto.

SEC. 73. In all matters relating specifically to women and minors the assistant commissioner shall have and exercise such duties and authority as may be prescribed by the commissioner with the approval of the associate commissioners.

SEC. 74. The commissioner and associate commissioners may, with the approval of the governor and council, appoint, and fix the salaries of, not more than five directors, and may, with like approval, remove the directors. Each director shall be assigned to take charge of a division of the department. The commissioner may also, subject to the civil service law and rules, where they apply, employ and remove such experts, inspectors, investigators, clerks, and such other assistants as the work of the department may require, and, subject to the provisions of chapter 228 of the General Acts of 1918, and the rules and regulations established thereunder, and to the approval of the governor and council, where that is required by law, fix the compensation of the said persons. The commissioner may require that certain inspectors in the department, not more than seven in number, shall be persons qualified by training and experience in matters relating to health and sanitation.

SEC. 75. All directors, inspectors, and other permanent employees of the department shall devote their whole time to the affairs of the department, and all directors and inspectors, and such other employees as may be designated by the commissioner, shall, before entering upon their duties, be sworn to the faithful performance thereof. Inspectors shall have the police powers granted by existing law to the inspectors of the board of labor and industries, except that those assigned to exercise the functions now exercised by the commissioner of standards shall have the powers now possessed by inspectors appointed by the commissioner of standards.

The number of inspectors employed by the department shall not, at first, exceed the number of inspectors in the service of the boards, commissions, and bureaus hereby abolished, and shall not thereafter be increased without the approval of the governor and council. The commissioner and associate commissioners shall determine from time to time how many of the inspectors employed shall be women. Section 10 of chapter 726 of the Acts of 1912 shall apply to inspectors appointed under the provisions of this section.

SEC. 76. The commissioner and associate commissioners may appoint committees, on which employers and employees shall be represented, to investigate and recommend rules and regulations, and changes in existing rules and regulations, within the scope of the powers and duties of the department.

SEC. 77. All the rights, powers, duties, and obligations of the commissioner of standards and the surveyor general of lumber shall be assigned to a division of the department, and the director in charge of said division shall be known as the director of standards. He shall exercise the functions of the commissioner of standards and the surveyor general of lumber, and shall perform such other duties as may be assigned to him by the commissioner.

SEC. 78. Any person affected by an order, rule, or regulation of the department may, within such time as the associate commissioners by vote may fix, which shall not be less than 10 days after notice of the order, or the taking effect of the rule or regulation, appeal to the associate commissioners, who shall thereupon grant a hearing, and after the hearing may amend, suspend, or revoke such order, rule, or regulation. The commissioner may, pending such hearing, grant a temporary suspension of the order, rule, or regulation appealed from. Any person aggrieved by an order approved by the associate commissioners may appeal to the superior court: *Provided*, That the appeal is taken within 15 days after the date when the order is approved. The superior court shall have jurisdiction in equity upon such appeal, to annul the order, if it is found to exceed the authority of the department, and upon petition of the commissioner, to enforce all valid orders issued by the department. Nothing herein contained shall be construed to deprive any person of the right to pursue any other lawful remedy.

CONCILIATION AND ARBITRATION.

Adjustment of Industrial Disputes in Kansas and Colorado.

Kansas Court of Industrial Relations.

THE action of the Legislature of Kansas in January of this year in establishing a special tribunal as a court of industrial relations has attracted widespread attention. The court consists of three judges appointed by the governor, with the advice and consent of the senate, for three-year terms, and was immediately (Feb. 2) organized. This court is given the powers previously held by the State public utilities commission, which is abolished. However, its principal powers, from the standpoint of immediate interest, relate to the regulation of designated classes of employments, industries, etc., "declared to be affected with a public interest and therefore subject to supervision by the State." Included are the manufacturing of food products and clothing, and processes connected therewith; the mining or production of fuel; transportation, and all public utilities and common carriers as defined by existing statutes of the State.

The court has power to make investigations, serve process, take testimony, and adopt rules and regulations to govern its own proceedings. Appeal lies to the supreme court from its findings. The public welfare is declared to require continuity and efficiency in the operation of the industries, etc., named; the willful hindering, delay, limiting, or suspension of such operations are therefore declared to be contrary to the purpose of the act. The court may act on its own initiative, or upon the complaint of either party to a controversy, or of ten citizen taxpayers of the affected community, or of the attorney-general of the State. Investigation may extend to the conditions surrounding the workers, their wages, returns to capital, the rights and welfare of the public, "and all other matters affecting the conduct of said industries, employments, public utilities, or common carriers."

The court is authorized to order any changes necessary in the matter of working and living conditions, hours of labor, rules and practices, and a reasonable minimum wage or standard of wages. Appeal may be taken within 10 days to the supreme court. If after 60 days' compliance the order is found to be unjust, unreasonable, or impracticable, the aggrieved party may apply for a modification,

and a hearing shall thereupon be had and the court of industry may modify its orders for cause shown.

Enforcement is by process issuing from the supreme court on proceedings by the industrial court. Persons willfully violating the provisions of the act or any valid order of the court are liable to fine not exceeding \$100 or imprisonment not exceeding one year, or both. Officers of corporations or of labor unions who use their official positions willfully to influence or compel violations are guilty of a felony and may be punished, upon conviction thereof, by a fine not exceeding \$5,000, or imprisonment at hard labor for not exceeding two years, or both. In case production or operation is suspended, the court may take proceedings for the taking over and operation of the industries or work affected. In any case a fair wage is to be paid the workers and a fair return allowed the owners.

It is an offense to do or perform any forbidden act, or fail or refuse to perform any act enjoined or directed by the court, acting either singly or in confederation with others; or to induce or intimidate any employer or worker to violate the orders of the court whether negatively or positively. Picketing, threats, abuse, or other forms of intimidation are unlawful in connection with the employments, industries, etc., governed by the act.

Unions of workers are recognized, as is the right of collective bargaining. Individual workers are guaranteed freedom of action in making or terminating contracts, but it is unlawful for individuals to conspire with other persons to quit employment for the purpose of hindering, delaying, or interfering with the operation of industries covered by the act. Employees testifying as witnesses or otherwise active in securing the attention or action of the court may not be discharged or discriminated against because of such action.

This is the most comprehensive attempt yet made to protect the public in cases of industrial disputes likely to affect its interests. The act has attracted attention in other States and in Congress, but it is too soon to announce any definite results under it. One point of interest in connection therewith is the establishment of a minimum wage for men. Kansas, in common with a number of other States, chiefly western, has a commission charged with the fixing of a minimum wage for women and for minors; but no State has thus far sought to fix a minimum wage for adult males. An initiative act has been proposed and filed with the Secretary of State, in the State of Oregon, looking toward the fixing of a minimum wage for both men and women; but the house resolutions committee of the State legislature directed its chairman to draft a resolution expressing the opposition of the legislature to the proposed law.

Colorado Industrial Commission.

THE nearest approach to the Kansas statute is an act of the State of Colorado, enacted in 1915, creating an industrial commission, and conferring upon it certain powers as to the adjustment of industrial disputes. This act is patterned to some extent after the Canadian Industrial Disputes Acts, and makes it unlawful for employers to declare or cause a lockout, or for employees to go on a strike prior to or during an investigation or arbitration of a dispute. This act received its first test in this regard during the coal strike of November last, a restraining order against the proposed strike of November 21 being issued under it by the District Court of the City and County of Denver. In obedience thereto the district officers of the miner's union recalled their strike order, resulting, it is claimed, in a production of coal more nearly normal than in any other State of that section of the country. However, the union attacked the law on the ground of its claimed unconstitutionality, and some technical questions as to its enactment. The act limits its application, at least in the case of lockouts, to industries "affected with a public interest." In its later deliberations the district court, without suggestion from either party, injected the test of public interest into the case in hand, and ruled that underground mines are not affected with a public interest and fall outside the act. The case has been carried to the supreme court on a writ of error for a decision on this subject, as well as on the constitutional questions, and it will be of interest to know what conclusion shall be reached by the court on these points. However, it seems obvious enough that coal mines are affected with a public interest, so that the main concern is with the validity of the act that undertakes to prevent the cessation of industrial operations on grounds of the public concern until suitable time for investigation has elapsed.

Though this first legal process for enforcement has thus been opposed, the commission reports results of great value flowing from the operations of the law.¹ Since its enactment in 1915, "this State has been comparatively free from labor trouble, and has been absolutely free from any protracted strike; and bloodshed, violence, and the destruction of property have been unknown."

The law requires 30 days' notice before a strike or lockout is actually engaged in; and this provision, "against which violent criticism has been directed, has saved the situation innumerable times." This period permits opportunity for conciliatory efforts, which have many times been successful. If this fails, informal conferences often afford a means of arriving at an understanding; while in other cases, formal hearings and awards are resorted to. From March, 1917, when the

¹ Second Report of the Industrial Commission of Colorado, 1917-18, pp. 98-121.

present commission took office, up to November 1, 1918, the commission handled controversies involving 1,430 employers and 28,888 employees. There were 196 cases reported to the commission, of which 145 were reported with the statutory 30 days' notice; 32 resulted in strikes of from 1 to 65 days' duration, but all were settled, the men returning to work. The record is believed to show "ample justification for the enactment and continued existence of the law," which all interests "are coming to view as a step in the right direction."

IMMIGRATION.

Opinion of Secretary of Labor With Regard to Membership in Communist Party.

THE deportation of one Englebrert Preis, an Austrian, alleged to be a member of the Communist Party of America and liable to deportation under the act of October 16, 1918, having arisen, the Secretary of Labor, Hon. W. B. Wilson, rendered the following opinion approving the recommendation of the Commissioner General of Immigration that Preis be sent back to his native country:

In re Englebrert Preis.

Age, 31; native of Austria; entered the United States at Port Huron, Mich., on November 13, 1915, having arrived in Quebec by S. S. *Scotan*, June 14, 1914. This is a case arising under the provisions of the act of October 16, 1918.

It is alleged that the alien is a member of the Communist Party of America, which is affiliated with the Communist International. The alien admits membership in the Communist Party of America, and that it is affiliated with the Communist International. The sole question, therefore, to be determined by the Secretary of Labor is: Is the Communist Party of America such an organization as is described in the act of October 16, 1918, membership in which makes an alien liable to deportation. The language of the act applicable to this particular case is as follows:

SECTION 1. * * * aliens who are members of or affiliated with any organization that entertains a belief in, teaches, or advocates the overthrow by force or violence of the Government of the United States. * * *

SEC. 2. * * * shall, upon the warrant of the Secretary of Labor, be taken into custody and deported in the manner provided in the immigration act of February 5, 1917.

It will be observed that belief in, teaching, or advocating the overthrow of the Government of the United States is not alone sufficient to bring any organization within the scope of the act. There must in addition be a belief in, teaching, or advocacy of force or violence to accomplish the purpose. Bearing that in mind we may proceed to an examination of the facts.

The manifesto and program and constitution of the Communist Party of America and the manifesto of the Communist International are submitted in evidence and their authenticity admitted. The

constitution of the Communist Party (see p. 19 of the manifesto) requires that—

SEC. 2. Applicants for membership shall sign an application card reading as follows:

The undersigned after having read the constitution and program of the Communist Party, declares his adherence to the principles and tactics of the party and the Communist International; agrees to submit to the discipline of the party as stated in its constitution and pledges himself to engage actively in its work.

An examination of the documents submitted clearly demonstrates the fact that it is the purpose of the Communist Party to overthrow the Government of the United States. There are many statements that might be quoted showing that purpose. The two following are typical. On page 9 of the manifesto and program the statement is made:

Communism does not propose to "capture" the bourgeois parliamentary State, but to conquer and destroy it.

And again on the same page:

The proletarian class struggle is essentially a political struggle. * * * The objective is the conquest by the proletariat of the power of the State.

Many other statements of similar purport are to be found in the same document. After having found that it is the purpose of the Communist Party to conquer and destroy the Government of the United States the next point of inquiry is as to how the conquest is to take place.

It is apparent that the Communist Party does not seek to attain its objective through the parliamentary machinery of this Government, established by, and operated under, the Constitution. That is made sufficiently clear by the following excerpt from page 15 of the manifesto referred to:

(b) Participation in parliamentary campaigns, which in the general struggle of the proletariat is of secondary importance, is for the purpose of revolutionary propaganda only.

And again from pages 9 and 10 of the same document:

In those countries where the conditions for a workers' revolution are not yet ripe, the same process will go on. The use of parliamentarism, however, is only of secondary importance.

And further on page 10:

The parliamentarism of the Communist Party performs a service in mobilizing the proletariat against capitalism, emphasizing the political character of the class struggle.

Communist Party's Attitude Toward Strikes.

THE parliamentary processes established by our Government are to be discarded or used for propaganda purposes only and other means adopted for overthrowing the Government of the United States. These means are stated at considerable length and frequently reiterated, seemingly for purposes of emphasis. The conquest of the power of the State is to be accomplished by the mass power of the proletariat.

Strikes are to be broadened and deepened, making them general and militant, and efforts made to develop their revolutionary implications. The strike is to be used not simply as a means to secure redress of economic wrongs, but as a means through which the Government may be conquered and destroyed. A few excerpts from the Communist Party and Communist International manifestos will make these statements evident.

Thus on page 10 of the manifesto and program of the Communist Party of America is the following:

The conquest of the power of the State is accomplished by the mass power of the proletariat. Political mass strikes are a vital factor in developing this mass power, preparing the working class for the conquest of capitalism. The power of the proletariat lies fundamentally in its control of the industrial process. The mobilizing of this control against capitalism means the initial form of a revolutionary mass action that will conquer the power of the State.

And again, on page 11 of the same document:

Mass action is industrial in its origin, but it acquires political character as it develops fuller forms. Mass action, in the form of general political strikes and demonstrations, unites the energy and forces of the proletariat, brings proletarian mass pressure upon the bourgeois State. The more general and conscious mass action becomes, the more it antagonizes the bourgeois State, the more it becomes political mass action. Mass action is responsive to life itself, the form of aggressive proletarian struggle under imperialism. Out of this struggle develops revolutionary mass action, the means for the proletarian conquest of power.

And further, on page 12 of the same document:

Strikes of protest develop into general political strikes and then into revolutionary mass action for the conquest of the power of the State. Mass action becomes political in purpose while extra-parliamentary in form; it is equally a process of revolution and the revolution itself in operation.

Then, on page 16:

The Communist Party shall participate in mass strikes, not only to achieve the immediate purposes of the strike, but to develop the revolutionary implications of the mass strike.

And then making the purpose still more clear, we have the following from page 30 of the manifesto of the Communist International, with

SERIES OF BULLETINS PUBLISHED BY THE BUREAU OF LABOR STATISTICS.

[The publication of the annual and special reports and of the bimonthly bulletin was discontinued in July, 1912, and since that time a bulletin has been published at irregular intervals. Each number contains matter devoted to one of a series of general subjects. These bulletins are numbered consecutively, beginning with No. 101, and up to No. 236; they also carry consecutive numbers under each series. Beginning with No. 237 the serial numbering has been discontinued. A list of the series is given below. Under each is grouped all the bulletins which contain material relating to the subject matter of that series. A list of the reports and bulletins of the Bureau issued prior to July 1, 1912, will be furnished on application. The bulletins marked thus * are out of print.]

Wholesale Prices.

- * Bul. 114. Wholesale prices, 1890 to 1912.
- Bul. 149. Wholesale prices, 1890 to 1913.
- * Bul. 173. Index numbers of wholesale prices in the United States and foreign countries.
- Bul. 181. Wholesale prices, 1890 to 1914.
- Bul. 200. Wholesale prices, 1890 to 1915.
- Bul. 226. Wholesale prices, 1890 to 1916.
- Bul. 269. Wholesale prices, 1890 to 1919. [In press.]

Retail Prices and Cost of Living.

- * Bul. 105. Retail prices, 1890 to 1911: Part I.
Retail prices, 1890 to 1911: Part II—General tables.
- * Bul. 106. Retail prices, 1890 to June, 1912: Part I.
Retail prices, 1890 to June, 1912: Part II—General tables.
- Bul. 108. Retail prices, 1890 to August, 1912.
- Bul. 110. Retail prices, 1890 to October, 1912.
- Bul. 113. Retail prices, 1890 to December, 1912.
- Bul. 115. Retail prices, 1890 to February, 1913.
- * Bul. 121. Sugar prices, from refiner to consumer.
- Bul. 125. Retail prices, 1890 to April, 1913.
- Bul. 130. Wheat and flour prices, from farmer to consumer.
- Bul. 132. Retail prices, 1890 to June, 1913.
- Bul. 136. Retail prices, 1890 to August, 1913.
- * Bul. 138. Retail prices, 1890 to October, 1913.
- Bul. 140. Retail prices, 1890 to December, 1913.
- Bul. 156. Retail prices, 1907 to December, 1914.
- Bul. 164. Butter prices, from producer to consumer.
- Bul. 170. Foreign food prices as affected by the war.
- * Bul. 184. Retail prices, 1907 to June, 1915.
- Bul. 197. Retail prices, 1907 to December, 1915.
- Bul. 228. Retail prices, 1907 to December, 1916.
- Bul. 266. A study of family expenditures in the District of Columbia. [In press.]
- Bul. 270. Retail prices, 1913 to 1919. [In press.]

Wages and Hours of Labor.

- Bul. 116. Hours, earnings, and duration of employment of wage-earning women in selected industries in the District of Columbia.
- Bul. 118. Ten-hour maximum working-day for women and young persons.
- Bul. 119. Working hours of women in the pea canneries of Wisconsin.
- * Bul. 128. Wages and hours of labor in the cotton, woolen, and silk industries, 1890 to 1912.
- * Bul. 129. Wages and hours of labor in the lumber, millwork, and furniture industries, 1890 to 1912.
- * Bul. 131. Union scale of wages and hours of labor, 1907 to 1912.
- * Bul. 134. Wages and hours of labor in the boot and shoe and hosiery and knit goods industries, 1890 to 1912.
- * Bul. 135. Wages and hours of labor in the cigar and clothing industries, 1911 and 1912.
- Bul. 137. Wages and hours of labor in the building and repairing of steam railroad cars, 1890 to 1912.
- Bul. 143. Union scale of wages and hours of labor, May 15, 1913.
- Bul. 146. Wages and regularity of employment and standardization of piece rates in the dress and waist industry of New York City.

Wages and Hours of Labor—Concluded.

- Bul. 147. Wages and regularity of employment in the cloak, suit, and skirt industry.
- Bul. 150. Wages and hours of labor in the cotton, woolen, and silk industries, 1907 to 1913.
- Bul. 151. Wages and hours of labor in the iron and steel industry in the United States, 1907 to 1912.
- Bul. 153. Wages and hours of labor in the lumber, millwork, and furniture industries, 1907 to 1913.
- Bul. 154. Wages and hours of labor in the boot and shoe and hosiery and underwear industries, 1907 to 1913.
- Bul. 160. Hours, earnings, and conditions of labor of women in Indiana mercantile establishments and garment factories.
- Bul. 161. Wages and hours of labor in the clothing and cigar industries, 1911 to 1913.
- Bul. 163. Wages and hours of labor in the building and repairing of steam railroad cars, 1907 to 1913.
- Bul. 168. Wages and hours of labor in the iron and steel industry, 1907 to 1913.
- Bul. 171. Union scale of wages and hours of labor, May 1, 1914.
- Bul. 177. Wages and hours of labor in the hosiery and underwear industry, 1907 to 1914.
- Bul. 178. Wages and hours of labor in the boot and shoe industry, 1907 to 1914.
- Bul. 187. Wages and hours of labor in the men's clothing industry, 1911 to 1914.
- Bul. 190. Wages and hours of labor in the cotton, woolen, and silk industries, 1907 to 1914.
- Bul. 194. Union scale of wages and hours of labor, May 1, 1915.
- Bul. 204. Street railway employment in the United States.
- Bul. 214. Union scale of wages and hours of labor, May 15, 1916.
- Bul. 218. Wages and hours of labor in the iron and steel industry, 1907 to 1915.
- Bul. 221. Hours, fatigue, and health in British munition factories.
- Bul. 225. Wages and hours of labor in the lumber, millwork, and furniture industries, 1915.
- Bul. 232. Wages and hours of labor in the boot and shoe industry, 1907 to 1916.
- Bul. 238. Wages and hours of labor in woolen and worsted goods manufacturing, 1916.
- Bul. 239. Wages and hours of labor in cotton goods manufacturing and finishing, 1916.
- Bul. 245. Union scale of wages and hours of labor, May 15, 1917.
- Bul. 252. Wages and hours of labor in the slaughtering and meat-packing industry.
- Bul. 259. Union scale of wages and hours of labor, May 15, 1918.
- Bul. 260. Wages and hours of labor in the boot and shoe industry, 1907 to 1918.
- Bul. 261. Wages and hours of labor in woolen and worsted goods manufacturing, 1918.
- Bul. 262. Wages and hours of labor in cotton goods manufacturing and finishing, 1918.
- Bul. 265. Industrial survey in selected industries in the United States, 1919. Preliminary report. [In press.]
- Bul. 274. Union scale of wages and hours of labor, May 15, 1919. [In press.]

Employment and Unemployment.

- Bul. 109. Statistics of unemployment and the work of employment offices.
- Bul. 116. Hours, earnings, and duration of employment of wage-earning women in selected industries in the District of Columbia.
- Bul. 172. Unemployment in New York City, N. Y.

which the Communist Party of America is affiliated and whose manifesto is accepted as part of the policy of the party:

The revolutionary era compels the proletariat to make use of the means of battle which will concentrate its entire energies, namely, mass action, with its logical resultant, direct conflict with the governmental machinery in open combat. All other methods, such as revolutionary use of bourgeois parliamentarism, will be of only secondary significance.

From these quotations and numerous other statements in the manifesto, not here quoted, it is apparent that the Communist Party of America is not merely a political party seeking the control of affairs of State, but a revolutionary party seeking to conquer and destroy the State in open combat. And the only conclusion is that the Communist Party of America is an organization that believes in, teaches, and advocates the overthrow by force or violence of the Government of the United States.

It does not devolve upon the Secretary of Labor officially to determine whether Congress was wise in creating the law, or the Communist Party wise in creating the facts. It is his duty to apply the law to the facts as he finds them. It is mandatory upon him to take into custody aliens who are members of this organization and deport them in the manner provided for in the immigration act of February 5, 1917.

Your¹ memorandum of January 17, 1920, recommending that the Department issue its warrant for the deportation of Englebrert Preis, such deportation to be to Austria, at Government expense, is hereby approved.

¹ Refers to the Commissioner General of Immigration.

BOOK REVIEWS.

FISHER, IRVING. *Stabilizing the dollar. A plan to stabilize the general price level without fixing individual prices.* New York, The Macmillan Co., 1920. 324 pp.

This book is a most valuable contribution to the discussion of prices. The author presents the facts as to price fluctuations, discusses the causes of changing commodity prices and price levels, points out the evils resulting from unstable prices, and presents his remedy for fluctuating prices and the evils growing therefrom.

The facts as to changing prices of individual commodities and all commodities taken collectively are determined now with great accuracy by means of index numbers. The author mentions all important index numbers in use at present and pays the United States Bureau of Labor Statistics the compliment of citing its index numbers as the best now being published. By means of index numbers it is clearly demonstrable that price levels all over the world have been steadily rising since 1897.

In chapter 2 the author discusses the causes of fluctuating price levels in different countries, and after a careful examination of all the available evidence reaches the conclusion that the chief cause operating to change price levels is the instability in the value of the money unit. By plotting the price curves of several different commodities in terms of commodities in general, he determines that Brussels carpets and eggs are much more stable in value than gold, which is the measure of prices in all the important industrial and commercial countries of the world to-day. Of course, the author does not take account of the violent seasonal fluctuations in the prices of eggs. As a matter of fact, eggs would make a very much worse measure of prices than gold. On the other hand, if the world had used Brussels carpets as the basis of its monetary and banking systems, price fluctuations would have been less violent than they have been during the period from 1890 to the present time.

In chapter 3 the author points out the evils resulting from fluctuating price levels. He shows that increasing prices do not mean general impoverishment but do mean the impoverishment of some and the enrichment of others. Contracts, although guaranteed inviolability in the Constitution of the United States, are violated and upset every year because of changes in the value of money, the medium through which settlements are made. Lowered real wages, because of increased prices of the necessities of life, lead to industrial unrest and the advocacy of violent measures to remedy this condition. The falling prices which culminated in the panic of 1893 and the following depression continuing until 1897 produced perhaps an equal amount of discontent, but in different quarters and for different reasons. The discontent of the 1880's and 1890's was principally a farmer's discontent against the holders of mortgages on his farm and the "bloated bondholders." The discontent to-day is leveled chiefly at the profiteers who are accused of being responsible for high prices. As a matter of fact, the profiteer is a result rather than a cause of high prices. He has been able to make large profits because prices have risen so sharply and continuously.

Chapter 4 summarizes briefly some of the remedies that have been proposed to cope with the high and ever-rising prices of the present. These proposed remedies range from parcels post to Government ownership and from housekeepers' market clubs to the single tax. The author then points out that the dollar is the only unit as yet unstandardized. The dollar is supposed to be a standard of value. In reality, however, it is merely a standard of weight. Prof. Fisher then presents his well-known plan for converting our present monetary unit from a fixed weight of gold of fluctuating value to a standard of fixed value of fluctuating weight. Briefly, the plan is to

retire from circulation all gold coins and to issue for circulation gold certificates. If the prices of commodities collectively increase, as shown by the official index number, the weight of gold represented by each gold certificate in circulation is increased accordingly so that the prices are speedily brought down to approximately their former level. If, on the other hand, the prices of commodities in general should fall, the gold content of the uncoined gold dollars is decreased proportionately and automatically, thus bringing prices up again to approximately their former level. The technical details of the plan are given in Appendix I. Appendix II gives the objections that have been raised to the plan. Appendix III presents some alternative plans that have been suggested.

An excellent bibliography of the more important index numbers now extant and the principal writings on index numbers is given in Appendix VI.

The book is admirably arranged for ready reference or for use as a text book in college classes. A short table of contents is given followed by an analytical table of contents which gives all the more important points discussed in the volume. At the beginning a general summary is presented followed by a more detailed summary by sections. The man who is pressed for time can get a very accurate understanding of the arguments and conclusions by reading the 20 pages of this summary by sections.

PUBLICATIONS RELATING TO LABOR.

Official—United States.

ALABAMA.—*State Mine Inspectors. Annual report of coal mines, 1918. Birmingham, 1919. 87 pp.*

The coal production in 1918 was 19,521,840 short tons, a decrease of 891,971 tons as compared with 1917. The coke tonnage was 4,344,726 short tons, a decrease of 523,872 tons compared with 1917. In 1918, 26,341 men were employed in and around the mines as against 27,921 in 1917, the decrease representing approximately the industry's contribution to the Army. The coal produced per employee in 1918 was 741 tons as compared with 731 tons in 1917. There were 110 fatalities against 108 in 1917. During the year 932 regular inspections and 146 visits to investigate fatal and nonfatal accidents were made.

DISTRICT OF COLUMBIA.—*Minimum Wage Board. Wages of women in hotels and restaurants in the District of Columbia. [Washington, October 10, 1919.] 23 pp. Bulletin No. 3.*

For an account of the conference which resulted in recommendation of a minimum wage for women employed in hotels and restaurants see pages 131 to 136 of this issue of the MONTHLY LABOR REVIEW.

ILLINOIS.—*Department of Mines and Minerals. Thirty-seventh annual coal report, 1918. Springfield, 1918. 306 pp. Illustrated.*

Compared with 1917 the report shows an increased production of 10,995,942 tons, an increase of 157 in the number of mines, an increase of four days in working time, and an increase of 10,479 employees. The total number of fatalities was 259, an increase of 52, or more than 25 per cent. A loss of 30 or more days resulted from the injury of each of 2,161 workers—an increase of 527, or 32.25 per cent over the preceding year. Falling roof and sides were responsible for 100 deaths and 713 serious injuries, and pit cars for 46 fatal and 516 nonfatal injuries.

INDIANA.—*Employment Commission. Some explanations concerning junior section, Indiana free employment service. Suggested phases of vocational guidance for minors. Indianapolis, August 1, 1919. 16 pp. Bulletin No. 1.*

KANSAS.—*Court of Industrial Relations. An act creating the Court of Industrial Relations, defining its powers and duties. Topeka, 1920. 14 pp.*

This act is discussed in an article on pages 214 to 217 of this issue of the MONTHLY LABOR REVIEW.

LOUISIANA.—*Department of Education. Plan for vocational education (prepared 1919). Approved by the Federal Board for Vocational Education. Baton Rouge, 1919. 40 pp.*

The plan includes agricultural, trade and industrial, and home economics education, and teacher training.

MARYLAND.—*State Department of Education. Vocational education in Maryland, 1919. Baltimore, 1919. 63 pp.*

MASSACHUSETTS.—*Bureau of Statistics. Forty-seventh quarterly report on employment in Massachusetts, quarter ending September 30, 1919. Boston, 1919. 21 pp.*

According to returns received from 1,184 labor organizations in Massachusetts, representing an aggregate membership of 257,390, the number of members unemployed for all causes at the close of September, 1919, was 13,863, or 5.4 per cent of the total number. This percentage is slightly higher than the corresponding percentage (5.1) for the close of the preceding quarter, but is lower than the corresponding percentage for the close of September in each year of the past decade except 1912 and 1916. The

number of strikes reported as having occurred during the quarter was 188 as compared with 161 during the preceding quarter.

NEW YORK.—*Department of Health. The public health manual, containing the public health law, the sanitary code and the provisions in other general laws relating to public health. Albany, February 1, 1919. 658 pp.*

Includes the text of the labor laws relating to the reporting of industrial poisons, employment of minors, physical examination of children in factories, powers and duties of boards of health relative to tenement-made articles, lunch rooms, and the employment of women and children in basements.

—*Industrial Commission. Health hazards of the chemical industry. Albany, November, 1919. 69 pp. Illustrated. Special bulletin No. 96.*

This report is noted more fully on pages 165 to 168 of this issue of the REVIEW.

—*Reconstruction Commission. Report to Gov. Alfred E. Smith on retrenchment and reorganization in the State Government. Albany, October 10, 1919. 419 pp. Charts.*

This is the full report of the commission.

A digest of the summary of the report was published in the January, 1920, issue of the MONTHLY LABOR REVIEW, pages 266 to 269.

PANAMA CANAL.—*Washington Office. Manual of information concerning employments for the Panama Canal Service, revised November 15, 1919. Washington, 1919. 35 pp. Form 151.*

PENNSYLVANIA.—*Department of Mines. Report. 1917. Part II.—Bituminous. Harrisburg, 1919. 1470 pp. Chart.*

The output of the coal mines of the State in 1917 reached the unprecedented total of 271,519,710 net tons, of which 171,074,411 tons were bituminous and 100,445,299 anthracite. Coke production was 23,240,777 tons. There were 342,734 men employed in and about the mines. The number of fatalities among workers was 1,075, compared with 1,030 to a total of 246,797,774 tons produced in 1915 and 1,001 to a total production of 256,804,012 net tons in 1916.

SOUTH DAKOTA.—*State Inspector of Mines. Twenty-seventh, twenty-eighth, and twenty-ninth annual reports, 1916, 1917, 1918. Pierre, 1917-19. 32, 36, 38 pp.*

The reports for 1917 and 1918 show a decrease in the activity of the mining industry, owing to shortage of labor and increased cost of production, the inactivity being most marked in 1918, when materials and supplies necessary for the recovery of gold had increased in cost, in some instances, as much as 100 per cent. The report for that year states, however, that "conditions are returning to normal with respect to labor, and this coming year will see all plants operating at full capacity."

Fatal accidents reported are 6 in 1916, 7 in 1917, 1 in 1918; permanently and totally disabled, 1 each in 1916 and 1917; permanently and partially disabled, 3 in 1916, 11 in 1917, and 2 in 1918; seriously injured (more than 14 days lost time), 105 in 1916, 114 in 1917, and 102 in 1918; slightly injured (1 to 14 days lost time), 683 in 1916, 590 in 1917, and 429 in 1918.

VIRGINIA.—*State Board of Education. Vocational agriculture in the secondary schools of Virginia. Richmond, January, 1920. 71 pp.*

WASHINGTON.—*State Mine Inspector. Annual reports of coal mines for the years ending December 31, 1916, 1917, 1918. Seattle, 1917, 1918, 1919. 121, 53, 62 pp.*

The coal production for 1918 was 4,128,424 short tons, which was an increase of 125,665 tons over the previous year and the largest production the State has yet had. There were 5,847 persons employed in and about the coal mines of the State, of whom 4,172 worked inside and 1,675 outside the mines. This was an increase of 502 employees over 1917. There were 34 fatal accidents and 692 nonfatal accidents.

WEST VIRGINIA.—*Department of Mines. Annual report for the fiscal year ending June 30, 1917. Charleston, 1917. 376 pp.*

During the year 88,665 persons were employed at the mines and coke ovens, an increase of 8,607 over the previous year. The average annual earnings of pick miners

was \$1,137.81, an increase of \$254.33 over 1916, while the rate per ton of run-of-mine coal mined was 69 cents as against 52 cents in 1916. The report tabulates 394 fatal and 993 nonfatal accidents.

WISCONSIN.—*State Board of Vocational Education. Courses of study. Teacher training. Madison, 1919. 16 pp. Monograph No. 5.*

UNITED STATES.—*Department of Labor. National War Labor Board. Report of the secretary for the 12 months ending May 31, 1919. Washington, 1920. 149 pp.*

Practically the entire text of the report of the secretary was published in the MONTHLY LABOR REVIEW for August, 1919 (pp. 262-270). This volume, however, includes detailed reports of the heads of the various departments of the board, including the department of procedure, the department of files and information, the department of examination, and the department of administration of awards. Appendix 1 is a special report on public utility cases, many of which were noted in the REVIEW from time to time as the awards were made. These awards are classified in this report under the following heads: Right to organize; Collective bargaining; Representation of workers; Equal pay for equal work; Women as conductors; Hours of labor; and Individual contracts. In Appendix 2 is presented an analysis of all of the decisions of the board up to May 31, 1919, which it is believed will be very useful to all students of industrial conditions. In this analysis the decisions of the board are classified under the general heads: No strikes or lockouts during the war; Right to organize; Existing conditions; Women in industry; Hours of labor; Maximum production; Mobilization of labor; Custom of localities; and The living wage. The principles and rules of procedure of the board are set forth in full in Appendix 3. Appendix 4 gives an account of the organization and practice of the board as adopted and amended to December 10, 1918.

— *Woman in Industry Service. First annual report of the Director of the Woman in Industry Service, for the fiscal year ended June 30, 1919. Washington, 1919. 29 pp.*

This service was organized in July, 1918, a year and three months after the entrance of the United States into the war, and the appointment of its director and assistant director announced July 9, 1918.

Briefly stated the purpose of this service is—

1. To consider all general policies with respect to women in industry and to advise the Secretary of Labor as to the policies which should be pursued.
2. To keep informed of the work of the several divisions of the department in so far as they relate to women in industry and to advise with the divisions on all such work.
3. To secure information on all matters relating to women in industry and to collate such information into useful form.
4. To establish useful connections with all governmental departments and divisions on this subject and with voluntary agencies and societies.

— *Department of the Interior. Bureau of Mines. Miners' safety and health almanac for 1920. Published in cooperation with the United States Public Health Service. Washington, 1919. 51 pp. Illustrated. Miners' circular 26.*

The second of a series, the first of which, for the year 1919, was issued as Miners' circular 24. This almanac contains "information on different diseases that cause much sickness and death among miners and their families, and points out how such diseases can be kept from starting and spreading. Also, it describes some of the more common causes of accidents in mines and shows how the miner can lessen the risks of his work."

— *Employees' Compensation Commission. Regulations concerning duties of employees, official superiors, medical officers, and others under Federal Compensation Act of September 7, 1916. Revised October 15, 1919. Washington, 1919. 75 pp.*

— *Federal Board for Vocational Education. Rehabilitation Division. A year's work in vocational rehabilitation in the twelfth district comprising California, Arizona, and Nevada. San Francisco, Flood Bldg., 1919. 29 pp.*

— *Government Printing Office. Superintendent of Documents. Immigration, naturalization, citizenship, Chinese, Japanese, Negroes, enlistment of aliens. List of publications. Washington, 1919. 16 pp. Price list 67, 3d edition.*

UNITED STATES.—*Interstate Commerce Commission. Collisions, derailments, and other accidents resulting in injury to persons, equipment or roadbed arising from the operation of railways used in interstate commerce. October, November, and December, and year 1918. Washington, 1920. 64 pp. Accident bulletin No. 70.*

A brief statement of the accidents which occurred in the year 1918 is contained on pages 159 and 160 of this issue of the REVIEW.

— *Railroad Administration. Agreement between the Railroad Administration and the employees represented by the Railway Employees' Department of the American Federation of Labor, and its affiliated organizations of the mechanical section and divisions Nos. 1, 2, and 3 thereof. Washington, 1919. 77 pp.*

The affiliated divisions to which this agreement is applicable are the International Association of Machinists, International Brotherhood of Boilermakers, Iron Ship Builders and Helpers of America, International Brotherhood of Blacksmiths and Helpers, Amalgamated Sheet Metal Workers' International Alliance, International Brotherhood of Electrical Workers, and Brotherhood of Railway Carmen of America. The agreement, which is dated September 20, 1919, covers hours of service, overtime work, preferences in reduction of forces, grievances, apprentices, rates of pay, shop conditions, personal injuries, and assignment of work. Eight hours is made the basic work day, while the rates of pay are increased an average of 4 cents an hour, except for mechanics in the car department, who were receiving 58 cents an hour and who received an increase of 9 cents, the increases to be effective from May 1, 1919. Special rules are laid down for each of the affiliated divisions, the subjects covered including qualifications, classification of work, apprentices and helpers, running repair work, and differentials.

— *General order No. 27, with its supplements, addenda, amendments and interpretations to June 30, 1919. Wages of railroad employees. Washington, 1919. 212 pp.*

General order No. 27 was printed in full in the June, 1918, issue of the MONTHLY LABOR REVIEW, pages 1-21.

— *Safety section circular No. 7. Aims and purposes of the safety section. Address delivered by A. F. Duffy before the steam railroad section of the National Safety Congress, Cleveland, Ohio, October 2, 1919. Washington, 1919. 7 pp.*

— *Treasury Department. Public Health Service. Annual report of the surgeon general for the fiscal year 1919. Washington, 1919. 346 pp.*

Included in this report is an account of the organization of a division of industrial hygiene in cooperation with the Working Conditions Service of the Department of Labor, and a brief statement of certain investigations conducted by this division the results of which have, in several instances, been made public. One of these was the investigation of electro-chemical and abrasive plants at Niagara Falls, carried on in cooperation with the Woman in Industry Service of the Department of Labor, an account of which is given on pages 161 to 168 of this issue of the REVIEW. Another investigation was that conducted in conjunction with the Children's Bureau for the purpose of establishing standards of height and weight for Southern mill children. To determine the extent of the lead hazard in the pottery industry, an investigation was made of 116 potteries, chiefly in New Jersey, and physical examinations were made of over 1,700 men. The report also mentions investigations made in a number of plants at the request of the United States Employees' Compensation Commission that the service assume advisory and in some instances direct charge of the medical relief in plants whose employees were judged to come under the Federal compensation law.

— *War Department. Surgeon General's Office. Defects found in drafted men. Statistical information compiled from the draft records showing the physical condition of the men registered and examined in pursuance of the requirements of the selective service act. Prepared under the direction of the Surgeon General, by Albert G. Love. Washington, 1919. 359 pp. 66th Congress, 1st session.*

Official—Foreign Countries.

ARGENTINA.—*Departamento Nacional del Trabajo. Trabajo a Domicilio. Industria de la Ropería Salarios Mínimos. Buenos Aires, 1919. 19 pp. (Ley Num. 10,505.)*

Report of the president of the commission on minimum wages in home work in the clothing industry concerning piece wages on various articles of clothing.

CANADA.—*Bureau of Statistics. The Canadian Year Book, 1918. Ottawa, 1919. 686 pp. Map.*

— *Parliament. House of Commons. Cost of living. Proceedings of the special committee appointed for the purpose of inquiring forthwith as to the prices charged for foodstuffs, clothing, fuel, and other necessities of life, and as to the rates of profit made thereon by dealers and others concerned in their production, distribution, and sale, etc. Comprising the evidence taken and papers submitted in connection therewith. Nos. 1 to 23. Ottawa, 1919. 1008 pp. Parliamentary session, 1919.*

The conclusions of this investigation were published in an article in the September, 1919, issue of the MONTHLY LABOR REVIEW, pages 113–118.

GREAT BRITAIN.—*Home Office. Mines and quarries. General report, with statistics, for 1918, by the chief inspector of mines. Part II.—Labor. London, 1919. Pp. 91–142. Cmd. 490. Price, 6d. net.*

The total number of persons ordinarily employed at mines and at the quarries under the Quarries Act in the United Kingdom and the Isle of Man during 1918 was 1,072,903 (1,029,688 at mines and 43,215 at quarries), or a net decrease of 12,568 persons as compared with the preceding year—a decrease of 12,152 at mines and 416 at quarries. Of those employed at mines, 807,086 worked underground, and 222,602 above ground. Of the latter 11,761 were females. There were 1,284 separate fatal accidents in and about mines and quarries, causing the loss of 1,487 lives, an increase of 36 fatalities as compared with the previous year. Of these accidents 1,220, causing the loss of 1,420 lives, happened at mines, and 64, causing the loss of 67 lives, happened at quarries; or, expressed in terms of the number of persons employed, the death rate from accidents per 1,000 persons at all mines was 1.379 for surface and underground workers, and 1.603 for underground workers alone for 1918 as compared with 1.339 for surface and underground workers and 1.500 for underground workers alone for 1917. The death rate per million of tons raised at mines under the coal mines act during 1918 was 5.86, as compared with the average of 5.08 for the decennial period 1908–17.

— *Local Government Board. Forty-eighth annual report, 1918–1919. Part I.—Public health; Local administration; Local taxation and valuation. Part II.—Housing and town planning. Part III.—Administration of the poor law; Old age pensions. Part IV.—Special work arising out of the war. London, 1919. 197 pp. Cmd. 413. Price, 1s. net.*

— *Ministry of Health. Housing. New methods of construction. London, 1919. 4 pp. Cmd. 426. Price, 1d. net.*

Statement of proposals submitted to the Ministry of Health for the provision of houses of new methods of construction which the ministry has approved.

— *Housing, Town Planning, etc., Act, 1919; regulations. October 6, 1919. London, 1919. 24 pp.*

— *Ministry of Labor. Joint Industrial Council. A review of progress and achievements, December, 1919. [London], 1919. 20 pp. Bulletin No. 2.*

Gives a list of 51 Whitley councils set up between January 11, 1918, and October 21, 1919, with a summary of progress, since July, 1919, showing what the various councils have achieved as regards wages, hours, and holidays; disputes and conciliation; employment of disabled men; welfare; safety; and research, organization, statistics, etc. Progress in the organization of district councils and works committees is also noted.

GREAT BRITAIN.—*Ministry of Labor. National Insurance (Unemployment) Bill, 1919. Memorandum on the financial clauses. London, 1919. 3 pp. Cmd. 440. Price, 1d. net.*

Explains financial readjustments necessary if benefit payable to workpeople insured under the national insurance (unemployment) acts, 1911–1918, is increased from 7s. to 11s. per week, as is proposed in the bill.

— — — *Report by the Government actuary. London, 1919. Cmd. 439. 3 pp. Price, 1d. net.*

States that "owing to the lack of suitable data at the time the original calculation was made, the risk to be undertaken was overvalued, and the benefit fixed at a substantially lower rate than the contribution would have borne." It is recommended that the benefit be increased from 7s. (par value of shilling, 24.3 cents) to 11s. a week.

— *Ministry of Reconstruction. Adult Education Committee. Final report. London, 1919. 409 pp. Cmd. 321. 5 appendices.*

The final report of the Adult Education Committee is the fourth of a series of reports put out by this committee upon the subject of adult education. The first of these dealt with Industrial and Social Conditions in Relation to Adult Education; the second, with Education in the Army; while the third considered the question of Libraries and Museums.

From the nature of the material considered the final report may be divided into three parts. In the first part the past history of the movement for adult education is traced and its present status discussed. The second part deals with the demand for adult education and the intellectual standards achieved in the work which is being done. The third part is devoted to a discussion of the weaknesses and possibilities of adult education; the place of adult education in the work of universities; and the very apparent need of greater cooperation on the part of the universities in affording to workers opportunity for courses of study which will lift them above their daily routine and prepare them for a more intelligent participation in the duties of citizenship; the supply of teachers, with proposals for increasing it; methods of financing adult education classes; technical education in its relation to modern industry; and a generous number of conclusions and recommendations.

— *Oversea Settlement Committee. Report to the president of the committee of the delegates appointed to inquire as to openings in Canada for women from the United Kingdom. April–September, 1919. London, 1919. 35 pp. Cmd. 403. Price, 4d. net.*

This report is a result of a personal investigation by the committee in Canada over a period of four months. The purpose of the inquiry was to determine the opportunities of employment for women from Great Britain in industrial, commercial, and other kinds of employment and in land settlement and in positions as domestics. The social conditions the women would meet, as well as wages and housing conditions, form part of the study. The appendixes contain the list of authorities consulted during the study, suggestions as to the establishment of community houses for the benefit of girls coming over as servants, opportunities provided for special training in domestic service, and accounts of the experiences of individual women who have settled on farms.

ITALY.—*Ufficio Centrale di Statistica. Le fluttuazioni stagionali nella vita economica italiana, by Riccardo Bachi. 261 pp. Annali di Statistica, series V, vol. 9. Rome, 1919.*

A volume of the statistical annals published by the Italian Central Statistical Office, containing a study by Prof. Riccardo Bachi on the seasonal fluctuations in the economic life of Italy. The aspects of economic life covered by the study include internal and foreign commerce, prices, money in circulation, discount rates, the money market, credit movement, industrial activity, labor market, transportation, municipal administration, pawnshops, and State finances.

MEXICO.—*Secretaría de Industria, Comercio y Trabajo. Plan de estudios de la escuela superior de comercio y administración. Mexico, 1919. 131 pp.*

Regulations, requirements, and courses of study adopted for the reorganization of the superior school of commerce and administration.

NETHERLANDS.—*Centraal Bureau voor de Statistiek. Beknopt overzicht van den omvang der vakbeweging op Januari 1917. The Hague, 1917. 34, xvii pp. Bijdragen, new series, No. 245.*

The following table, taken from the report, sets forth the growth of trade-union membership in the Netherlands, 1913 to 1917. The figures for 1918 and 1919 were taken from *Maandschrift van het Centraal Bureau voor de Statistiek*, August, 1919 (p. 959).

TRADE-UNION MEMBERSHIP IN THE NETHERLANDS, 1913-1919.

Name of organization.	1913	1914	1915	1916	1917	1918	1919
National Labor Secretariat.....	8,097	9,697	9,242	10,510	14,309	23,068	33,626
National Federation of Trade Unions..	61,447	84,261	87,598	99,511	128,918	159,449	191,138

— — — *Overzicht betreffende de loonen en den arbeidsduur bij werken ten behoeve van het Rijk bij aanbesteding uitgevoerd in 1913. The Hague, 1917. xxix, 24 pp. Bijdragen, new series, No. 238.*

Presents a summary view of wages and hours of labor on public works (State and municipal) executed by contract in the Netherlands during 1913. Previous studies have covered the years 1894, 1899, 1902, 1903, 1905, and 1908.

— — — *Statistiek van de loonen en den arbeidsduur der volgens de Ongevallenwet 1901 verzekerde werklieden in de papier industrie, in 1911. The Hague, 1917. xv [2], 10 pp. Bijdragen, new series, No. 242.*

This report is a survey of the paper-making industry in the Netherlands and presents comprehensive data as to wages and hours of labor of persons employed in the industry as of 1911.

— — — *Werkstakingen en uitsluitingen in Nederland gedurende, 1915-1916. The Hague, 1917-18. 2 vols. Bijdragen, new series, Nos. 239, 250.*

The following table, contained in a French summary in the text, gives in brief form the official reported data respecting strikes and lockouts in the Netherlands since 1910:

Year.	Number of strikes.	Number of lockouts.	Number of persons affected.	
			Strikes.	Lockouts.
1910.....	1 133 (131)	13	4,507	8,731
1911.....	1 205 (197)	12	19,122	883
1912.....	1 265 (260)	18	19,620	2,052
1913.....	1 400 (383)	27	23,990	6,171
1914.....	1 250 (241)	21	13,953	1,706
1915.....	1 259 (244)	10	14,373	806
1916.....	1 356 (345)	21	17,146	2 981

¹ Number of strikes for which number of strikers was reported.

² Applies to only 20 lockouts, number affected not being reported in the case of one lockout.

NETHERLANDS.—*Departement van Arbeid. Arbeidsvoorwaarden van het personeel op handelskantoren. The Hague, 1919. 56 pp. Uitgaven, No. 24.*

A study by the department of labor of hours, wages, and working conditions of store, office, and petty shop employees, covering 3,035 shops in which 23,427 were employed. Classified wages, per month, of 10,956 workers in August, 1914, are reported, as follows:

NUMBER AND PER CENT RECEIVING CLASSIFIED AMOUNT OF WAGES PER MONTH,
AUGUST, 1914, BY SEX.

[Par value of florin=40.2 cents.]

SWEDEN.—*Socialstyrelsen. Levnadskostnaderna i Sverige 1913-14. Del III, Hushållsräkenskaper. Stockholm, 1919. 493 pp. Sveriges Officiella Statistik, Socialstatistik.*

Comprises part 3 of an extensive study of household budgets in Sweden in 1913-14. This volume contains a detailed statement of the sources of income and expenditures for various items of expenditure for each of the 908 families included in the investigation. These families were distributed throughout the 8 principal cities in the country, excluding Stockholm.

SWITZERLAND.—*Bureau Fédéral des Assurances. Rapport sur les entreprises privées en matière d'assurances en Suisse en 1917. Bern, 1919. 107* 193 pp.*

This volume is the annual report of the Swiss insurance bureau for the year 1917.

Unofficial.

ALLEN, FREDERICK J. *Advertising as a vocation. New York, The Macmillan Co., 1919. 178 pp.*

AMERICAN FEDERATION OF LABOR. *Arizona Branch. Proceedings of the eighth annual convention, held at Phoenix, Oct. 27-Nov. 1, 1919. Phoenix, 1919. 71 pp.*

— *Utah Branch. Proceedings of the fifteenth convention, held at Salt Lake City, September 9 to 12, 1919. Salt Lake City, 1919. 48 pp.*

AMERICAN WRITING PAPER CO. *Cost of living in Holyoke, Mass., July, 1919. An investigation made by John W. Scoville. Holyoke, 1919. 12 pp. 4 charts.*

Shows changes in the cost of the principal items of the family budget in Holyoke since 1913. The change in the cost of food was calculated from quotations of retail prices charged on January 1 of each year since 1913 furnished by local grocers, and

from advertised quotations in 1913 and 1919. In order "to get a composite food cost" the cost in 1913 and July, 1919, of specified amounts of each of 13 articles of food were calculated, and the results showed that the total cost had risen from \$54.97 in 1913 to \$102.88 in 1919, an increase of over 87 per cent. Figures for rents were based on those paid in 30 apartments in sections of the city where employees of the company live; it was found that rents had increased about 9 per cent. Fuel and light increased about 27 per cent. To obtain the increases in clothing and sundries the wholesale price index numbers of the United States Bureau of Labor Statistics were used; these items had increased 107 and 91 per cent, respectively.

Weighting the items according to their relative importance in the family budget, the company found that the increases since 1913 were as follows:

	Per cent.
Food.....	37.4
Rent.....	1.6
Fuel and light.....	1.4
Clothing.....	13.9
Sundries.....	18.2
All items.....	72.5

The company relates these figures to the changes in hourly wage rates paid to its employees. No figures are given as to wage rates but a chart is shown indicating changes in both wages and cost of living. The report states:

Since July, 1918, hourly wage rates have advanced more than the cost of living. The purchasing power in goods of an hour's labor was about 15 per cent higher in July, 1919, than in 1913, as shown by the curve on commodity wage rates. However, weekly earnings would deviate somewhat from the wage rate curve, on account of variations in the amount of employment.

ASSOCIATION OF LIFE INSURANCE PRESIDENTS. *Proceedings of the twelfth annual meeting, held in New York, December 5 and 6, 1918.* New York, 1919. 162 pp.

Papers of interest to labor were on Vocational retraining—a national conservation, by Dr. Charles A. Prosser; Group insurance as an influence in promoting stability in labor groups, by Eugenius H. Outerbridge; and Failure of German compulsory insurance—a war revelation, by Frederick L. Hoffman.

BABSON, ROGER W. *W. B. Wilson and the Department of Labor.* New York, Brentano's, 1919. 276 pp.

BLOOMFIELD, DANIEL (COMPILER). *Modern industrial movements.* New York, The H. W. Wilson Co., 1919. 377 pp. *The handbook series.*

This book contains a collection of articles which have appeared in periodicals and in reports and other publications on the following subjects: Cooperation; syndicalism, industrial unionism, and the I. W. W.; shop stewards; scientific management; guild socialism; management sharing; bolshevism; labor parties; and industrial reconstruction programs. A short bibliography on each subject is included.

BOSTON PUBLIC LIBRARY. *Industrial problems, chiefly American; selected references to books and magazines in the Public Library of the City of Boston.* Boston, December, 1919. 18 pp.

Contents: Collective bargaining and trade agreements; strikes and lockouts; boycotts and blacklists; injunctions in labor disputes; arbitration; open and closed shop; labor representation in industry.

BUREAU OF INDUSTRIAL RESEARCH, NEW YORK. *Selected list of references on trade and labor unions.* New York, 289 Fourth Avenue, December, 1919. 12 mimeographed pages.

BUREAU OF MUNICIPAL RESEARCH OF PHILADELPHIA. *Workingmen's standard of living in Philadelphia. A report, by William C. Beyer.* New York, The Macmillan Co., 1919. 125 pp.

BUREAU OF RAILWAY NEWS AND STATISTICS. *Railway statistics of the United States of America for the year ended December 31, 1918.* Chicago, 1919. 148 pp.

States that the average number of employees during 1918 was 1,897,741, as compared with 1,780,235 in 1917, and 1,703,577 in 1916. The total wages and salaries paid in 1918 was \$2,686,734,498, as compared with \$1,781,027,002 in 1917 and \$1,511,728,926 in 1916. The average compensation per employee in 1918 was \$1,416; in 1917, \$1,001; and in 1916, \$887. It is stated that nearly 60 of the 77 per cent, or over \$1,175,529,000 increase in the cost of labor between 1916 and 1918, went to the individual employee, and that only 17 per cent was due to the increase in the number employed.

Accident statistics show that for the first nine months of 1918, 7,056 persons were killed and 134,730 injured in railway accidents. In 1917 the number killed was 10,087 and the number injured 194,805. In 1916 the figures were 10,001 and 196,722, respectively. Of the persons killed in 1918, 394 were passengers on trains, 2,127 employees on duty, and 4,535 other persons, of whom 126 were employees not on duty, 2,442 were trespassers, 1,506 nontrespassers, and 461 persons killed in nontrain accidents.

BUREAU OF VOCATIONAL INFORMATION. *Vocations for business and professional women. Published in cooperation with the National Board of the Young Women's Christian Associations.* New York, 2 West 43rd Street, May, 1919. 48 pp. Bulletin No. 1.

Discusses "those occupations in which women have made a definite and permanent place for themselves and in which younger women, the workers of the future, may expect to find fields for service."

BURTON, THEODORE E., AND SELDEN, G. C. *A century of prices. An examination of economic and financial conditions as reflected in prices, money rates, etc., during the past 100 years.* New York, The Magazine of Wall Street, 1919. 118 pp. Graphs.

The text and graphs of this book first appeared in the Magazine of Wall Street. The aim is to "explain the great controlling principles of business and finance in the straightforward fashion of one business man talking to another." Chapters of special interest deal with Prices and an index of economic and investment conditions, Great economic forces since 1790, and What American commodity prices show.

ČAPEK, THOMAS. *The Čechs (Bohemians) in America. A study of their national, cultural, political, social, economic, and religious life.* Boston, Houghton Mifflin Co., 1920. 294 pp. Illustrated.

CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE. *Division of Economics and History. Preliminary economic studies of the war No. 14. British labor conditions and legislation during the war, by M. B. Hammond.* New York, Oxford University Press (American branch), 1919. 335 pp.

The social conditions in England prior to the war, particularly with relation to housing, drink, sickness, pauperism, and old age, and the effect which social legislation had upon problems of the war, are reviewed, as well as the condition of English industry and labor at the outbreak of the war. The author treats also of the effects of the munitions of war acts, the methods taken to secure an adequate supply of labor, changes in wages, cost of living, and hours of labor, measures taken for the relief of unemployment, and the problem of labor unrest. The final chapter is devoted to plans for industrial reconstruction, especially the Whitley councils, and the demands of the Labor Party for nationalization of public utilities.

CHELLEW, HENRY. *Human and industrial efficiency.* London, University of London Press, 1919. 170 pp.

An argument for the reconstruction of the relationships between employees and employed along the lines of scientific management. The author believes that housing and working conditions must be satisfactory, that every effort must be made to eliminate excessive fatigue, and that the psychology of the workers must be studied; also that the workers must be animated by "the right spirit," and that the greatest factor in efficiency, and therefore in success, is that the individual shall feel an interest in his work.

CLINIC FOR FUNCTIONAL REEDUCATION OF DISABLED SOLDIERS, SAILORS AND CIVILIANS. *First annual report, 1918-1919.* New York, 5 Livingston Place, 1919. 52 pp.

DOUGLAS, DOROTHY W. *American minimum wage laws at work.* Reprinted from the *American Economic Review*. December, 1919. Pp. 701-733.

A digest of this paper was published in the January, 1920, issue of the MONTHLY LABOR REVIEW, page 180.

ELMER, MANUEL C. *Armourdale, a city within a city.* The report of a social survey of Armourdale, a community of 12,000 people living in the industrial district of Kansas City, Kansas. Topeka, June 15, 1919. 91 pp. Illustrated. *Bulletin of the University of Kansas*. Vol. XX, No. 12.

GILBRETH, FRANK B. AND LILLIAN M. *Fatigue study.* The elimination of humanity's greatest unnecessary waste a first step in motion study. Second edition, revised. New York, The Macmillan Co., 1919. 175 pp. Illustrated.

HOLLANDER, JACOB H. *American citizenship and economic welfare.* The Weil lectures, 1919, delivered at the University of North Carolina. Baltimore, The Johns Hopkins Press, 1919. 122 pp.

Three lectures on The weal of the Nation, The laborer's hire, and The sinews of peace. In discussing wages the author holds that a progressive standard of life should form the basis upon which the final arbitral award is reached in the arbitration of all industrial disputes involving wage demands. He believes that "In the matter of collective bargaining, in the arbitral determination of labor disputes and in the validation of the standard of life as a wage principle—the industrial experience of the war years have resulted in notable progress," and agrees that the device of the local shop committee has been planted "so well and so broadly throughout industry—as hardly to seem eradicable."

HOLTZ, MAX L. *Review of the accomplishments of the Rochester clothing industry for the year 1919.* A report presented at the twenty-ninth annual meeting of the Clothiers' Exchange, December 20, 1919, by the president. [Rochester, 1919.] 24 pp.

The achievements of the Rochester market for the year 1919 are said to have been (1) the establishment of a definite labor policy, with the machinery for its administration, based on a system of collective bargaining that now has been adopted practically by the industry as a whole, and which has brought about a better understanding between employer and employee than exists in any other industry in the country; (2) the establishment of a definite market policy toward the retailer, based on the square deal; and (3) the development of the spirit of cooperation.

LABOR PARTY (BRITISH). *The capital levy (How the Labor Party would settle the war debt),* by F. W. Pethick Lawrence. London, 33 Eccleston Square, 1919. 8pp. Price, 2d.; post free, 2½d.

— *International economic policy,* by L. S. Woolf. London, 33 Eccleston Square, 1919. 10 pp. Price, 2d.; post free, 2½d.

— *Memoranda: Continued education under the new education act; The juvenile worker at the end of the war; Nursery schools.* London, 33 Eccleston Square, 1919. 24 pp.

These memoranda, prepared by the advisory committee on education, emphasize the points to be watched in the carrying out of the new education act; measures to be taken for coping with the problem of juvenile employment and unemployment; and the necessity for the early establishment of nursery schools, provided for in the act.

LLOYD, JOHN WILLIAM. *Cooperative and other organized methods of marketing California horticultural products.* Urbana, Ill., 1919. 142 pp. *University of Illinois studies in the social sciences*, Vol. VIII, No. 1, March, 1919.

MANES, ALFRED. *Versicherungs-Staatsbetrieb im Ausland.* Berlin, 1919. 128 pp.

In this volume has been collected the experiences of various State, provincial, and municipal Governments which either have established Government monopolies of insurance or have underwritten insurance in competition with private insurance companies. The States most extensively covered in the volume are Uruguay, which in 1912 established a general insurance monopoly, and Italy, which in the same year enacted a law making the underwriting of life insurance a state monopoly.

In summing up the results achieved by foreign Governments in carrying on an insurance business the author arrives at the following conclusions:

1. State insurance institutes operated in competition with private insurance companies as a rule have achieved indifferent results and only in exceptional instances have proved to be more advantageous to the community than private companies.

2. Monopolistic state insurance institutes established on the basis of voluntary insurance show even less favorable results from an economic point of view than state institutes operated in competition with private companies. This is perhaps due to the absence of competition.

3. In compulsory insurance countries the experiences of monopolistic state insurance institutes, at least with respect to fire insurance, were in part favorable, while the experiences in all other branches of insurance vary greatly, but were largely unfavorable.

NATIONAL INDUSTRIAL CONFERENCE BOARD. *The cost of living among wage earners,* Lawrence, Mass., November, 1919. Boston, 1919. 21 pp.

This pamphlet is reviewed in this issue of the MONTHLY LABOR REVIEW, pages 71 and 72.

READE, W. H. V. *The revolt of labor against civilization.* New York. Longmans, Green and Co., 1919. 80 pp.

STÖSTRÖM, CHRISTOPHER. *Fackföreningsrörelsen och Socialdemokratien.* Andra upplagan. Stockholm, 1918. 30 pp.

Discussion of the relationship of the trade-union movement and the political labor movement (socialism).

SOCIAAL-DEMOCRATISCHE ARBEIDERSPARTIJ IN NEDERLAND. *Arbeidersjaarboekje*, 1919. Amsterdam [1919]. 190 pp.

Yearbook of the Dutch Labor Party for 1919.

SQUIRES, BENJAMIN M. *The Marine Workers' Affiliation of the Port of New York.* [New York, 1919.] pp. 840-874. Reprinted from *The Journal of Political Economy*, Vol. xxvii, No. 10, December, 1919.

Articles by Mr. Squires covering the facts contained in this article appeared in the MONTHLY LABOR REVIEW, August, 1918, pp. 45-62; September, 1918, pp. 1-26; February, 1919, pp. 12-27; April, 1919, pp. 246-249; August, 1919, pp. 173-185.

USSING, CARL. *De Kollektive arbejdsaftalers fremtid.* Copenhagen, 1919. 16 pp. *Dansk Forening for Socialpolitik*, 7. hefte.

This lecture delivered by the President of the Permanent Arbitration Court of Denmark appears also in the December, 1919, issue of *Social Forsorg* issued jointly by the staffs of the social insurance, factory inspection, and employment service of Denmark. After pointing out what he considers to be chronic defects in the present relations of capital and labor, Judge Ussing concludes that the collective agreement

is here to stay as a means of adjusting industrial relations, although the industrial conflict as such will continue. He recommends broadening the membership of the arbitration tribunal so as to include more than a single judge to represent the public or society at large.

WARD, HARRY F. *The New Social Order—Principles and programs.* New York, The Macmillan Co., 1919. 384 pp.

The first section of this book is devoted to a discussion of the need for a new social order; the second half is taken up with the programs for the new order.

WORKER'S EDUCATIONAL ASSOCIATION. *Sixteenth annual report and statement of accounts, July 1, 1919.* London, 16 Harpur Street, 1919. 60 pp.

This general report of the central council for 1918-19 covers the growth of the association, classes and lectures, summer schools, publications, a statement of accounts, district reports, overseas work, the constitution of the association, and a roster of the tutorial classes in 1918-19.

MONTHLY LABOR REVIEW

VOL. X—NO. 4

WASHINGTON

APRIL, 1920

The Cost of Industrial Accidents.¹

By ROYAL MEEKER, UNITED STATES COMMISSIONER OF LABOR STATISTICS.

THAT the cost of industrial accidents is enormous is recognized by all who have any knowledge of industry and of statistics. Just how enormous the cost is we do not know, and can not even guess. We do not know how many industrial accidents occur in any State in the Union. We know even less of the nature, results, and social cost of these accidents. The most important of all industrial accidents, unemployment, we have not even come to recognize as an accident at all, although it causes vastly more slowing down of production, demoralization, distress, and suffering than all other industrial mishaps.

No doubt most people suppose that very accurate and up-to-date statistics of industrial accidents causing physical injuries exist in the 42 States, 4 Territories, and in the jurisdiction of the United States Government, because of the workmen's compensation laws. Nothing could be farther from the truth. Statistics of accidents, their results and their cost, have been compiled in but few of these compensation jurisdictions, and such statistical compilations as have been made are utterly incomparable because of marked differences in the provisions of the different laws and the lack of standardization of the methods of statistical presentation. There is an astonishing lack of uniformity in these laws as to the industries and occupations covered, the waiting period and the amount of money compensation, and the medical benefits provided. The compensation law of New Jersey includes farm and domestic labor and fishermen besides industrial workers in the narrower sense. Mr. Carl Hookstadt, of the Bureau of Labor Statistics' staff, estimates that perhaps 98 per cent of all workers may be brought under the New Jersey Act. In Alabama, on the other hand, the exclusions are so numerous that the percentage of workers which may possibly be brought under the protection of this so-called compensation law is only 33.6 per cent. Mr. Hookstadt in his estimates has given the benefit of the doubt in every instance to the laws, consequently his estimates err on the side of too great liberality. This is noticeably true of Pennsylvania in which he credits the law with a coverage of 88.8 per cent of all wage earners, although farm, domestic, and casual labor are excluded,

¹ Address delivered at the Pennsylvania Safety Congress, held at Harrisburg, Pa., Mar. 21-25, 1920.

and Pennsylvania is, with all its industries, a great agricultural State. Maine, with an estimated coverage of 72.9 per cent, excludes farm, domestic, and casual labor and logging operations, one of the most important industries and the most hazardous one, of the State. Tennessee, with an estimated coverage of 37.2 per cent, excludes establishments with less than 10 employees, farm, domestic, "casual," and public employees, and coal mines, which employ more men than any other industry of the State in this the most hazardous, perhaps, of all industries.

There is no rhyme or reason to the exclusions of the laws in the different States. Some exclude nonhazardous occupations and industries; others exclude the hazardous occupations. Taking all the States together, Mr. Hookstadt's very liberal estimate credits the compensation laws with a coverage of about 65 per cent of the workers. When we consider the number who are shut out by failure to elect in those States having elective laws and the number who are ignorant of their rights to compensation under the law, I think not more than 40 per cent of the wage earners are actually enjoying the meager protection of our compensation laws.

The lack of uniformity in coverage is equaled or surpassed by the inexplicable inequalities in money and medical compensation benefits provided in the laws. The length of the waiting period too varies considerably, thus causing the amount of compensation benefits to vary. It is impossible in this paper to indicate the extent of the variations in the amount of compensation provided. It is even more impossible to ascertain the reasons or the vagaries which obsessed the legislators in enacting some of the more peculiar of the compensation laws. But surely, it will be said, the States must know how much is paid out each year for compensation and from these figures a reasonably accurate calculation or estimate of the cost of industrial accidents can be made. Perhaps the States know how much they pay in compensation each year; but if they do they, with few exceptions, keep this valuable information strictly to themselves. Even if this information were available, it would be an impossible task, for reasons pointed out above, to translate it into the money costs of industrial accidents, to say nothing of the other costs.

It does seem incredible that of the 42 jurisdictions which have had workmen's compensation laws long enough to give them accident compensation experience, only 26 have found it possible or worth while to publish anything showing the costs of compensation to the employers covered in their acts. Of course, many compensation commissions may have knowledge of what they are doing which they do not give to the public. Employers, employees, and the undefined public have a right to know all the facts regarding the number and severity of accidents and the amount of compensation paid. This

information is so easy to compile, it would seem possible for all jurisdictions to make it public every year. Even the astonishingly meager information extant is discouragingly vague and impossible of interpretation.

State Compensation Reports.

IT IS too soon to expect reports for 1919, but California, Montana, and the United States Employees' Compensation Commission have already reported for that year the money payments for fatal and non-fatal cases and the medical costs. Only five States—California, Maryland, Minnesota, Montana, and New Jersey—report compensation payments separately for fatal and nonfatal cases and for medical treatment and burial for the years 1916 to 1918, inclusive. Michigan reported these costs for the year 1916 and then quit, Nebraska for 1917 and 1918, and the United States Employees' Compensation Commission for 1918. Oklahoma and Wisconsin show for the three years, 1916–1918, the total money compensation and the medical and burial benefits. Hawaii, New York, and Vermont published this information for 1916; Texas for 1916 and 1918; Massachusetts for 1916 and 1917; Iowa for 1917 and 1918; and South Dakota for 1918. Ohio and Nevada have published the total amounts paid for compensation and burial for 1916–1918; Connecticut for 1916 and 1917; Pennsylvania for 1916; Colorado for 1917 and 1918; Indiana for 1917; Kentucky and Wyoming for 1918.

Seventeen jurisdictions have thus far published for the year 1918 the total amounts paid for all compensation, including medical benefits. The years cover quite different months. Some are calendar years, some fiscal years, and some compensation years determined by the date when the compensation laws became operative. The total amount of all compensation as reported by these 17 jurisdictions was \$16,782,610. The total estimated number of workers included therein was nearly 11,600,000 and the total estimated number entitled to come under the acts was 5,360,000. If we assume that five million workers were actually brought under the acts, the compensation payments would amount to a yearly charge of \$3.36 per employee. The utter uselessness of this average of a whole series of averages is shown by bringing it into contrast with the average cost of \$4.85 per employee for Ohio, \$4.39 for California, and \$1.72 for New Jersey. These wildly different costs bear no readily ascertainable relationship to the actual costs of accidents in these different States. The real cost of accidents in Ohio is not of course two and one-half times their cost in New Jersey. The differences are due to differences in industries covered, waiting period, amount of compensation provided, maximum and minimum limits, and other differences in the acts and the administration of them.

It will be readily conceded that the way of the proverbial transgressor is no harder than that of the virtuous statistician bent on compiling statistics of compensation payments in the various compensation jurisdictions within the United States. Why worry about these compensation payments by the States? If we had them they would not mean a thing as to accident frequency, accident severity, or accident cost. Very true, but the employers, employees, legislators, and administrators of each State should know how much is being awarded every year in their State in compensation to injured workers regardless of the fact that these amounts represent only a fraction of the actual social losses due to industrial accidents in each State.

It is a waste of time to try to compute the costs of industrial accidents from the reports of compensation payments made by the States. It is, however, well worth while to show just how far we still are from knowing anything definite about these costs or even about the payments made by employers under the compensation laws. If what I have said will have the effect of spurring some delinquent State to provide for something like adequate statistics of accident occurrence, results and cost, I shall feel that my labors with the not very fascinating or illuminating reports have not been in vain.

Are Accidents Decreasing?

BEFORE leaving this arid statistical desert, I wish to call attention to the fact that compensation payments are increasing year by year in all the States which have published figures which enable us to make comparisons. The unwary might jump to the conclusion that these increases are due to the growing number of industrial accidents. It may be that accidents are increasing. It is a shameful confession to be obliged to make, but we don't know whether the net result of our efforts to reduce industrial accidents has been more accidents or fewer accidents, a greater or a smaller loss in disability-time. I can not formulate a stronger plea for better and more complete statistics than these poor mute figures shout from the pages of these reports. We do know that certain plants have cut down the frequency of accidents. The analyses made by Mr. L. W. Chaney of the accident records of some steel plants show that they have not only reduced their accident frequency rates, but, what is of real importance, they have cut down their severity rates as well. Fewer man-hours are lost per 1,000 hours worked by some establishments to-day than before the war, and that in spite of most adverse conditions. Whether these encouraging results apply to the whole steel industry or not, we can not say. As to what is happening in other industries, we are as blissfully ignorant as the ostrich with his head buried in the sand.

Some individual plants require very complete reporting of every accident and some of these plants tabulate and analyze these reports for the purpose of reducing accidents and accident costs. I am bound to say, however, that only a few of the largest and most progressive employers know whether their accident experience is improving or growing worse. Some who think they are improving fool themselves into so thinking, because they are able to show a smaller number of accidents or a smaller rate of accident occurrence. If these employers had their accidents tabulated by severity of injury their time losses would show greater than at any time since they began to preach the gospel of safety-first to their workers.

I am ready to believe that the accident severity rate has not grown worse since 1912, when the safety movement became fully organized. I am ready to believe it, because I want to believe it. Individual plants and great corporations comprising many plants have reduced their accident rates, both frequency and severity rates. What has been done by one employer, or perhaps one industry, can surely be done by many or all. I am quite willing to believe that the growing compensation bill, the universal experience in all States, is due to extending the coverage of the laws, liberalizing the compensation provided, cutting down the waiting period, better and more enlightened administration methods and practices, and the growing knowledge of the workers as to their rights under the laws. Let us hope these explanations really explain this phenomenon. But why should we trust to blind faith when the expenditure of a few thousand dollars would give us assured knowledge? Faith is a beautiful trait. In its proper place it is a virtue greatly to be praised; but it is no fit substitute for statistics in determining public policy or the results of a public measure.

Of course, the economic cost of industrial accidents was enormously greater before compensation laws were enacted. It can not be too frequently or too emphatically stated that providing for compensation payments to injured workers does not create a new cost to be borne by industry and the community. It merely readjusts the burdens, thereby making them lighter to carry and incidentally bringing home to employers and the public the fact that industrial accidents are an expensive luxury. The first workmen's compensation laws were advocated and their enactment secured largely under the theory that the vast majority of industrial accidents occur through nobody's fault or negligence and that therefore the theories of employer's liability, employee's carelessness, and contributory negligence were all wrong. If necessity is the mother of invention, experience is its father. A short experience under compensation laws convinced insurance carriers and insurance payers that industrial accidents are not a divinely ordained and established part of the

great plan of creation, and therefore beyond the power of mere man to control or influence in any way. The more enlightened insurance companies and employers had made this important discovery long before compensation legislation had been thought of in this country, but it required the painful experience of paying for industrial injuries and the necessity of reducing these charges on the costs of production to bring forth the idea that industrial accidents are not chance occurrences like thunderstorms, earthquakes, and volcanic eruptions, but are, in most instances, the inevitable results of negligence on the part of either employer or employee. Do not misunderstand me as advocating a return to the old employers' liability system with the common-law defenses. It would be difficult to devise a more unjust system than that. In few cases of industrial accident can negligence of the employer be proven. Negligence on the part of the employee is more obvious, but even that is not easy to prove. The old liability system was thoroughly bad with its expensive litigation, cumbersome and occult court procedure, long delays, unsatisfactory verdicts, and consequent aggravation of class suspicions and hatreds. To-day, however, we who take pride in working for the common welfare advocate the workmen's compensation laws more vigorously than ever, not because industrial accidents are inevitable, but because they are inevitable but avoidable consequences of bad shop and machine construction, or bad shop practice. The best way to improve these bad features is to make it costly to the backward, unenlightened employers to continue them or allow them to be continued. I do not, of course, say that all that has been accomplished in the way of reducing, or preventing the increase of, our accident rates is the result of the enactment of compensation laws. I do say, however, that the compensation laws have done more than any other one thing to stimulate interest in and give an intelligent program to the safety movement. Accident reports are for the first time required by law and some progress has been made toward gathering and compiling standard accident tables. The accident records are being studied for the first time by capable statisticians and safety men for the purpose of ascertaining how, why, and what accidents occur and of preventing as many as can be prevented. Our knowledge of accidents, like our compensation laws, is still very imperfect, but we at least realize that industrial accidents are costly and that they are, to an unbelievable degree, preventable.

The Accident of Unemployment.

AS TO unemployment, the most costly and the only purely industrial and occupational accident, we have no reliable record whatever. A man may break his arm by falling over a cuspidor in his home; he may be killed by any fool driving an automobile.

Everything in the way of a physical injury that can occur to him while working at his regular occupation can happen to him in his home, on the street, at church, any place he may be. But the only way he can become unemployed is to lose his job. Nonindustrial physical injury accidents are probably quite as numerous as and even more destructive than industrial physical injury accidents. There is no such thing as nonindustrial unemployment. It is therefore the only purely industrial hazard. There are two very distinct kinds of unemployment—what we may call out-of-work unemployment and unemployment on the job. Both result in material loss to the individual worker and to society and in the demoralization of the worker. Out-of-work unemployment is a self-explanatory term and needs no elucidation. By “unemployment on the job,” I mean the lost time and consequent slowing down of production because of the deliberate expert loafing on the part of the workers, or the lack of a proper system of routing of work, and insufficient reserves of tools, machines, and skilled pivotal men to keep the whole force working smoothly.

The unemployment due to strikes excites most attention, because the newspapers and magazines play up such dramatic manifestations. Newspaper correspondents are in the habit of setting down their guesses as to the cost in money of the more important strikes, while some especially ambitious writers have attempted to estimate the money cost of all strikes for a selected period. I do not wish to try to diminish the seriousness of the menace or the appalling waste occasioned by strikes, when I say that the individual and social losses from strikes are relatively unimportant as compared with the losses from unemployment of the regular, orthodox, undramatic type that doesn't get any newspaper advertising. The cost of strikes is commonly displayed as losses of wages to the strikers, loss of profits to the employers, and loss of interest on capital invested. These estimates are necessarily crude and often misleading. It sometimes happens in a big strike that the curtailment of production results in such a sharp advance in the price of the product that the employer makes not a loss but a net gain. In such a case idle capital earns more for the owners than busy capital. But this fact does not convert the capital loss into a gain. In such a case the buying public and the wage earners bear the whole burden of the material losses incident to the strike. If the wage earners win the strike they may be able to drive such a shrewd Scotch bargain as to shift the entire burden of loss to the ultimate consumers. It would be more accurate to calculate the material losses of a strike in terms of product unproduced and then allocate the losses between the several parties at interest, taking account of changes in prices and wage rates in the industry.

If the material losses were to be computed as indicated above at the expense of great labor and much time, the computer could tri-

unplausibly display an appallingly huge sum of money which would be a more or less inaccurate estimate of the material cost of the strike or strikes and which would give no hint of the really important and significant costs of these industrial upheavals. Money can not measure the class suspicion and hatred generated or aggravated, the demoralization of the workers resulting from idleness, especially if the strike is lost, the inconvenience, destitution, suffering, and death to workers and to consumers which so frequently accompany a big strike bitterly contested.

Prevalence and Cost of Unemployment.

STRIKES and lockouts have contributed their thousands to the ranks of the out-of-workers, but irregularities and failure in supplies of raw materials, transportation, and demand for commodities produced, and lack of proper organization in industry, have contributed their millions. No statistical statement is possible, for no accurate information exists as to the time lost by reason of strikes, to say nothing of our almost 100 per cent of ignorance of the time lost due to other causes. We do know in a general way that unemployment has existed during prosperous conditions of industry to an appalling degree. For years the States of Massachusetts and New York published figures showing percentage of unemployment among trade-union members in those States. In Massachusetts the unemployment percentage among unionists rises to 17.9 per cent in 1914, while the minimum at any time since 1908 was 3 per cent in 1918. The unemployment percentage is even greater in New York State, the maximum being 40.1 per cent in 1913, and the minimum 5.9 per cent in 1912. Unemployment among trade-union members in Great Britain, as shown by official figures, rarely exceeds 8 per cent and drops as low as three-tenths of 1 per cent of the total membership.

No accurate comparisons between Great Britain and New York and Massachusetts are possible because unemployment in Great Britain is determined by the receipt of trade-union unemployment benefits which are paid for varying periods that differ among the unions—usually only after the member of a union has been out of work for one week, and not more than 26 weeks. Few American unions pay out-of-work benefits and the trade-union secretaries in most instances reported as unemployed all nonstriking members of their unions who were not actually working on a given date or over a period of time. The British figures were, of course, much more complete and accurate than the New York and Massachusetts figures, for they were based upon numbers actually receiving unemployment benefits, whereas the American figures included only those reporting to the union headquarters or the number estimated (guessed at) by the secretary. The

British figures differentiate those out on strike or lockout from those unemployed through other causes. The American figures are supposed to exclude workers out on strike. How much the American figures would be reduced if we could exclude all unemployment under one week, or how much the British figures would be increased if all unemployed were counted on a selected day, we can only guess. It seems inescapable, however, that if the figures could be corrected and brought to a common basis, unemployment among trade-unionists would be shown to be several times more prevalent in the United States than in Great Britain in the years before the war. How unemployment in the two countries would compare to-day we have no means even of guessing. The Unemployment Insurance Act of Great Britain enables the Government and the people to know very accurately the amount of employment and unemployment at any time. In the United States we know less than ever about unemployment because both New York and Massachusetts have given up their efforts to ascertain the number of trade-union members out of work. The only official figures we now have bearing on employment and unemployment for the whole country are those published in the MONTHLY LABOR REVIEW, giving for a limited number of plants in certain industries the number of employees on the pay roll and the amount of the wage bill each month, and the statistics of strikes which are carried from time to time.

The percentage of unemployment among nonunion workers is always higher than among union members. This was especially true of the United States before the war, when it was the deliberate policy of the largest employers of labor, especially unskilled or semiskilled labor, to keep on tap, as it were, a large reserve force of labor upon which to draw in case of strike or any emergency requiring additional men. This practice has almost disappeared because the surplus supply of labor has been succeeded by a dearth of labor in most localities and industries. One inevitable result of the very profound changes in labor supply has been to increase the proportion of the unemployed who are out of work because of strikes. But we must not too hastily jump to the conclusion that all or most unemployment to-day is due to strikes. No definite statistical information exists, but from a study of such cases as have come to my attention I am convinced that strikes to-day, as always, are insignificant in causing stoppage of work in comparison with unemployment due to dearth of raw materials, lack of orders for output, insufficient transportation, lack of a properly balanced organization of industry, lack of an intelligent employment policy for hiring and handling men, failure to gain and keep the good will of employees, failure to make use of the tremendous latent creative force lying dormant in the workers.

I have heretofore been unfavorable to unemployment insurance in this country for the reason that we lack the necessary machinery to carry such a law into effect. The dangers of industrial catastrophe and depression which lie in the not distant future make it absolutely necessary that we adopt now a constructive program to deal with unemployment. For the guidance of legislators and administrators the facts as to employment and unemployment must be known. A proper system of unemployment insurance is, I think, indispensable for ascertaining the amount and kind of unemployment. It is not necessary that the unemployment benefits be so large as to support idlers in idleness. The trained expert loafers who work at their craft all the year round would, of course, be excluded from benefits. The good old law which John Smith created and executed in the colony of Virginia should be revived. "Those who won't work can't eat." Unemployment insurance connotes, as a necessary part of the system, that everybody shall work when suitable work is offered.

The cost of this most costly and destructive of all industrial hazards, unemployment, is appalling. Its money cost, reckoned in terms of product unproduced, services unrendered, and capital goods lost or deteriorated in value, I estimate, or guess, would amount to more than half the value of the yearly product of all our industries. This means that we are operating our industries on a 66 $\frac{2}{3}$ per cent efficiency basis and are losing by not producing something like thirty-five billion dollars a year, just because we have not yet recognized that ignorance, however blissful, is mighty expensive. Of course, unemployment insurance alone will not increase our national income to more than one hundred billion dollars at a single bound. But it will help to call attention to the cost of unemployment, just as workmen's compensation laws have called attention to the costs of the less costly and less demoralizing industrial accidents which result in physical maimings and deaths. The aim of all employers, employees, managers, and engineers should be to prevent all preventable industrial accidents. In order to do this they must be informed as to what, where, and how accidents occur, the results of such accidents, and the means by which they may be reduced or eliminated. The greatest need of the world to-day is for facts—statistical facts. Every dollar spent for real statistics will save two dollars which will otherwise be wasted in needless experimentation.

The law of Pennsylvania offers an experience of four years, from January 1, 1916, to December 31, 1919. The following is a summary of this experience prepared by the statistician of the compensation board, showing compensation awards and payments, medical costs not included.

Special attention is called to the fact that for fatal accidents the figures represent cases for which awards were made (not the number of cases occurring) in each year, the sum being the full amount of compensation awarded during the year, including \$100 funeral benefits.

For nonfatal accidents covered by the schedule for major dismemberments (loss of eye, arm, hand, leg, or foot) the amount reported is the full award made in cases adjudicated during the year;

while in other cases the report is of the full amount paid on account of disabilities which terminated during the year.

These figures are not comparable with those given above for other jurisdictions, and are presented solely as showing compensation payments and awards in an important industrial State.

COMPENSATION EXPERIENCE IN PENNSYLVANIA FOR FOUR YEARS, 1916 TO 1919.

[Medical cost not included.]

Year.	Fatal accidents.		Nonfatal accidents.		Total.	
	Number of cases.	Compensation. ²	Number of cases.	Compensation. ³	Number of cases.	Compensation.
1916.....	1,727	\$4,116,075	69,566	\$3,417,655	71,293	\$7,533,730
1917.....	1,946	4,189,328	48,122	2,265,884	50,068	6,455,212
1918.....	2,607	6,859,718	67,313	4,780,197	69,920	11,639,915

³ Awards made during year in schedule cases; total benefits paid in other cases.

Scope and Operation of the Workmen's Compensation Laws of the United States.

By LINDLEY D. CLARK.

A QUESTIONNAIRE of the British Government on the subject of compensation to workmen for injuries was submitted to the Department of Labor for information as to conditions and results under the laws of the various States. This questionnaire called for data not to be found in any single publication now in existence. The laws in existence at the end of the year 1916 appear in Bulletin No. 203 of the Bureau of Labor Statistics; new legislation and amendments of 1917 and 1918 appear in Bulletin No. 243. Legislation of 1919 has been collated, but the date of its publication can not yet be announced. A comparison of the laws in force up to December 31, 1917, with detailed analysis covering many of the points of the questionnaire appears in Bulletin No. 240. This bulletin has been revised and brought up to date, but will not be ready for distribution for some time. The published bulletins present the facts largely as they exist, no very considerable modification having taken place by reason of recent legislation, though many minor changes have been made, and some of more importance. New laws have also been enacted in four States—Alabama, Missouri, North Dakota, and Tennessee—not mentioned in any of these bulletins. A very general summary reply to the inquiries under the various heads of the questionnaire was prepared, the facts shown being as of December 31, 1919. The questionnaire follows:

Workmen's compensation. British questionnaire, 1919.

I.—Scope of System.

1. What occupations and industries are included?
2. What classes of workers are included? What special provisions are there, if any, in regard to particular classes, e. g., State employees and seamen?
3. Are any, and, if so, what industrial or occupational diseases covered as well as injuries by accident? What special provisions are there, if any, in regard to such diseases?

II.—Character of System Adopted.

1. Whether (a) State fund.
(b) Mutual associations.
(c) Private insurance companies.
If there is a State fund, whether it has a monopoly, or competes with private insurance companies and mutual associations.
2. Security for payment of compensation—whether by compulsory insurance, State guaranty, or otherwise.
3. If compulsory insurance, how does the State enforce the obligation on the employer to insure?

4. If there is a State guaranty—
 - (a) What is its form?
 - (b) If a fund is established, from what source is it maintained, how is it administered, and to what extent is it drawn upon?
 - (c) What risks are covered?
5. If no security by compulsory insurance or State guaranty, what evidence is there of workmen's loss of compensation through inability of employers to pay, insolvency of insurance company, and so forth?
6. Self-insurance.—If allowed, on what conditions and to what extent resorted to? Is any other form of contracting out permitted?
7. Reasons, historical, economical and otherwise, why system actually in force was adopted, and whether, since inception, it has undergone any, and, if so, what modifications, with reasons for the change.
8. Criticisms by employers, workers or others of existing system.

III.—Comparison of Different Methods of Insurance.

Where alternative methods of insurance are allowed—

- (1) How do State fund, mutual associations, and private insurance companies compare, in regard to efficiency and services given, with special reference to methods adopted to secure expedition in dealing with claims?
- (2) Comparison, accompanied where possible by detailed statistics, showing—
 - (a) Cost of premiums or assessments.
 - (b) Numbers of employers adopting the alternative methods generally, or according to particular trades.
 - (c) Cost of administration as compared with amount of compensation paid.

IV.—Organization of State Funds.

1. ADMINISTRATIVE:

- (a) Constitution, powers, and procedure of authorities administering funds.
- (b) Extent to which representatives of employers and workers respectively have a voice in management.
- (c) Does State employ agents or advertise when State fund is in competition with private companies?
- (d) Machinery for payment of compensation or benefit. Is agency, e. g., of post office, resorted to?

2. FINANCIAL:

- (a) Are sufficient moneys raised in each year to cover?

- (1) The cost of claims which arose during the year and were disposed of during the year, e. g., cases of temporary incapacity when the worker has recovered?
- (2) All liability in respect of claims which arose during the year and were a continuing liability at the end of the year, e. g., cases where incapacity is still continuing and which involve future payments? Is the sum set aside for every case of permanent total or permanent partial incapacity estimated on an annuity basis, and, if not, how is it estimated? Are periodical valuations made to ascertain whether the yearly provision made for liability for outstanding claims has in fact proved sufficient?

- (b) Sources of income.

- (1) Do workers contribute, and to what extent?
- (2) Does State contribute, and to what extent—whether by direct payment, or by the provision of services of officials, office accommodation, traveling expenses, etc., the cost of which is charged to general State outlay and not to the State fund?

2. FINANCIAL—Continued.

(c) What are the requirements as to reserves?

(d) Is the solvency of the fund guaranteed by the State? If so, how?

(e) Premiums.

Principles and methods of establishing rates. Risk classification.

How far are premiums or contributions varied from year to year according to risks of each particular establishment or class of establishment?

(f) Financial difficulties encountered, their cause, and how surmounted?

(g) When State fund set up and given a monopoly of workmen's compensation insurance, what provision, if any, was made in regard to existing private insurance companies?

(h) When State fund set up to compete with private companies, what has been the effect on the cost of the premiums of the latter?

V.—Organization of Mutual Associations.

1. ADMINISTRATIVE:

(a) Basis on which constituted, e. g., by trades or districts.

(b) Constitution and membership. Whether any minimum requirements as to numbers of employers or size of area.

(c) Extent and methods of cooperation (if any) of State or of local authorities in administration.

(d) Special provisions, if any, for particular employments, e. g., agriculture, navigation.

(e) Extent to which representatives of employers and workers have a voice in management.

(f) Machinery for payment of compensation or benefit. Is agency, e. g., of post office, resorted to?

2. FINANCIAL:

(a) How amount to be raised each year is arrived at.

(b) Are sufficient moneys raised in each year to cover—

(1) The cost of claims which arose during the year and were disposed of during the year, e. g., cases of temporary incapacity where the worker has recovered?

(2) All liability in respect of claims which arose during the year and were a continuing liability at the end of the year, e. g., cases where incapacity is still continuing and which involve future payments.

Is the sum set aside for every case of permanent total or permanent partial incapacity estimated on an annuity basis, and, if not, how is it estimated?

Are periodical valuations made to ascertain whether the yearly provision made for liability for outstanding claims has in fact proved sufficient?

(c) Sources of income.

Does State contribute, and to what extent?

Do workers contribute, and to what extent?

(d) What are the requirements as to reserves?

(e) Premiums or assessments.

Principles and methods of establishing rates.

Risk classification. How far are premiums or assessments varied from year to year according to risks of each particular establishment or class of establishment?

(f) Financial difficulties encountered, their cause, and how surmounted?

VI.—State Regulation and Supervision.

1. Is there State regulation and supervision—
 - (a) Of private insurance companies in regard to—
 - (1) formation and operation;
 - (2) form and provisions of policies;
 - (3) financial soundness;
 - (4) premium rates?
 - (b) Of mutual associations in regard to—
 - (1) formation and operation;
 - (2) financial soundness;
 - (3) premiums or assessments on members?
2. Organization and powers of central department or board exercising such regulation and supervision.
 - (a) To what extent does it act through local bodies, branches, or agencies?
 - (b) What periodical statistics and returns does it require from insurance companies and mutual associations?
3. Cost of State regulation and supervision.
Whether borne wholly or in part by the funds of—
 - (a) private insurance companies;
 - (b) mutual associations.

VII.—Cost of Compensation.

1. Figures showing cost to industry generally, and to the chief industries in particular.
2. Has cost risen in recent years? If so, to what extent, in what class or classes of cases, and what is the cause?

VIII.—Benefits.

1. In case of death—
Amount—to whom paid and how apportioned—whether in form of lump sum or pensions—in case of pension, subject to what conditions if lump sum, what steps taken to insure profitable use of money.
2. In case of incapacity—
Scale for total incapacity—scale for partial incapacity—date from which compensation begins—is any distinction drawn between permanent and temporary incapacity as regards scale and nature of benefit—provisions for review if commutation allowed, how calculated, and whether lump-sum payment permitted?
3. Does compensation vary according as accident was due to—
 - (a) Fault of workman;
 - (b) General hazard of industry;
 - (c) Fault of employer?
4. Is there any scale for compensating injury according to nature of physical injury, occupation, and age of injured person?
5. Is disfigurement a ground for compensation and, if so, how is amount determined?
6. Is medical and surgical aid included among benefits? If so, in what circumstances and at what stage; and how is it administered?

IX.—Old and Infirm Workers.

Effect of workmen's compensation laws on the employment of the old and infirm.
Are there any special provisions in such laws for their protection?

X.—Relation of Accident Insurance with Any Other Forms of Insurance.

Is accident insurance administered in coordination with any other forms of insurance? For example, sickness or invalidity insurance? If so, to what extent are they worked as parts of the same system, and what are the circumstances determining which form of insurance applies?

XI.—Malingering.

1. Extent to which it exists and precautions adopted.
2. To what extent it varies under different methods of insurance, and reasons for such variation.

XII.—Accident Prevention in Connection with Workmen's Compensation.

1. Direct or indirect effects of workmen's compensation laws on number of accidents.
2. What provision, if any, is made under workmen's compensation law with this object, and is it supplementary to or in lieu of other laws and regulations for promoting industrial health and safety, and, if supplementary, how is overlapping in administration avoided?

XIII.—The Determination of Claims.

1. How far and on what conditions and subject to what supervision are agreements as to compensation allowed between the worker and the employer or compensation authority?
2. To whom or to what authority are claims submitted in the first instance?
3. Constitution and procedure of tribunals established for adjudicating on claims.
4. How far do administrative bodies sit also as judicial tribunals?
5. Provisions for appeal.
6. How medical aspect of case dealt with.
7. Whether expert assistance given in regard to lodgment and pursuit of claims.
8. Expense incurred in connection with settlement of disputes and determination of claims—
 - (a) By employers;
 - (b) By workmen.
9. How is delay avoided in the payment of benefit in cases where the claim is admitted? What time elapses as a rule between the date of claim and payment of benefit?
10. Extent of litigation.

XIV.

Whether any change in existing law is in contemplation or demanded. If so, nature of demand, classes of community making the demand, and causes for the desire for change.

XV.—Voluntary Insurance of Persons not Subject to Compulsory Insurance.

Whether in existence (if so, details) or in contemplation.

The reply follows:

I.—Scope of System.

THE occupations and industries included vary in the laws of the 42 States having legislation on this subject, some being enactments covering practically the whole body of industrial undertakings, while in others there is a limitation to so-called hazardous or extra-hazardous employments. Domestic and farm labor is very generally excluded. Some laws provide compensation for such employees only as are exposed to the hazards of the employment, though more generally all employees of an employer covered by the act come

within the provisions of the law. A majority (30) of the States are elective as regards the acceptance of the provisions of their laws, leaving it to the choice of the employer and the employees whether they will adopt this form of accident relief, or will continue under a liability system; however, where the employer declines to accept the provisions of the compensation law, the common-law defenses of fellow service, assumption of risk, and contributory negligence are abrogated; in 12 States and under the Federal statute the compensation system is compulsory, and must be accepted by the classes of employers embraced within the act,¹ while other classes may also avail themselves of the provisions of the law by election.

An exclusion that arises by reason of the relation of the State and Federal Governments is that of railroad employees engaged in interstate commerce. These come under the Federal liability law, to the exclusion of State legislation; and to avoid complications, a number of the States exempt all railroad employees, intrastate as well as interstate, from the provisions of their compensation laws.¹

All classes of workers engaged in the industries covered are, as a rule, embraced within the provisions of the laws. Casual employees, not engaged in the regular work or business of the employer, are quite generally excluded.¹

State employees are compulsorily covered in a number of the laws in which private employment is covered only after election. On the other hand, in a few States, public employments are excluded.¹ The Federal statute relates to public employees only, which is true also of the extension of this law to the District of Columbia.

There is no special treatment accorded seamen, unless it be one of neglect. Being subject to Federal control on account of the jurisdiction of Congress over interstate and foreign commerce, they occupy a position somewhat similar to that held by railroad employees. Their rights in admiralty remain, and they have long had the right of choosing common-law remedies when appropriate. Recent congressional action gives them also the choice of making claim under the compensation law of their State, in lieu of other procedure, if they choose to do so.

All the more important maritime States have compensation laws, so that most injured maritime workers are presumably able to seek redress under compensation laws if they desire; but the situation is far from clear or satisfactory.

Industrial or occupational diseases are specifically covered by the laws of but three States: California, Connecticut, and Wisconsin. In Massachusetts and North Dakota the term "injury" as used in the law is construed to cover occupational disease. The Federal statute is similarly construed. None of these laws enumerates the diseases

¹ See chart at end of this article.

which are to be compensated, the Connecticut law being applicable to the diseases due to "causes peculiar to the occupation, and which are not of a contagious, communicable or mental nature"; while in Wisconsin the act covers not only accidental injuries but also "all other injuries, including occupational diseases growing out of and incidental to the employment."

II.—Character of System Adopted.

A STATE fund exists in 17 States, being exclusive or monopolistic in eight and competitive in nine.¹ Where the fund is not exclusive, insurance may be carried by either private or mutual companies; in three States: Kentucky, Massachusetts and Texas, a mutual company was created by the law as a State agency; however, in but one of these (Kentucky) does the State take any part in the appointment of the directors of the company.

2. Payment of compensation is secured by obligatory insurance in 39 States, while in three no provision of this kind exists.¹ In no case does the State itself guarantee the payment of compensation or the solvency of the State funds; yet, as a matter of fact, the legislature of California appropriated a considerable sum to pay the benefits due workmen insured in a private company that became insolvent.

3. Where insurance is compulsory, the failure of the employer to insure subjects him to a fine, or leaves him liable to a suit for damages with the common-law defenses abrogated.

4. There is no State guaranty of any fund, strictly speaking. The laws provide methods of recoupment, so as to care for overdrawn accounts, by premium payments from the employers or groups of employers affected.

5. Security by compulsory insurance is so very general that there is little experience on which to base an estimate as to losses due to the lack of it. The question was recently asked of a number of compensation boards and commissions as to losses due to insolvency, etc., and the number of losses reported is very small, though there is known to be some.

6. Self-insurance is allowed in 31 States in which insurance is obligatory.¹ Employers wishing to avail themselves of this method must give satisfactory proof of their ability to make payments that may become due, and they also may be required to furnish security or make a deposit to cover their prospective liabilities. No form of contract is permitted which limits the responsibility of the employer or reduces the amount payable under the law.

7. No general statement can be made of the reasons why systems vary as they do in the 42 different States having compensation laws.

¹ See chart at end of this article.

The expression has been frequently used that the law of a given State should meet the peculiar industrial condition or stage of industrial development of that State. The relative influence of organized labor and organized employers has doubtless been effective in determining the stringency of the provisions adopted. The State fund, especially as an exclusive system, is naturally vigorously opposed by the stock companies, but in no case has it been abolished after original enactment, while in one State at least (Ohio) it has been advanced by amendment from a competitive to an exclusive system. The change is said to be due to the common opinion of employers and workers that the exclusion of private companies tended to economy and efficiency. A similar end is being sought in other States, but none of these has yet made the change.

8. Criticisms addressed to the existing system would probably in no case go to the principle involved, but only to some detail of administration, or to the amount of benefits. The tendency has been continuously to increase the amount of the awards and to reduce the waiting time, amendments along these lines being enacted practically each year. No form of industrial legislation has made the rapid progress achieved by compensation since the initial enactment of laws of this class, the present situation being the result of growth during a single decade.

III.—Comparison of Different Methods of Insurance.

THIS is one of the most difficult, because one of the most controverted, subjects included in any discussion of compensation legislation. Reports of State commissions in which State funds are discussed give some data, but more by way of a statement of the operations of the funds than any comparison with private insurance systems. The MONTHLY LABOR REVIEW for April, 1919 (pp. 210-216), gives a summary of the replies of a number of State officials to a series of questions on this subject. The address by Mr. Carl Hookstadt on "Tests of efficiency in workmen's compensation administration," published in the December, 1919, MONTHLY LABOR REVIEW, also gives matter of interest in this connection. The subject is also developed briefly in an address by Dr. Royal Meeker, Commissioner of Labor Statistics, on "Minimum requirements in compensation legislation." This appeared in the MONTHLY LABOR REVIEW for November, 1919. A most interesting and authoritative contribution to this discussion is an article, "An adventure in State insurance," in the December, 1919, issue of the American Economic Review, Princeton, N. J. This gives an account of the successful growth of the competitive State fund of California, written by Mr. A. J. Pillsbury, then chairman of the State Industrial Accident Commission.

A Massachusetts report for the year 1917 gives the general average loss cost per \$100 of pay roll as 62 cents for stock companies; and for mutuals, 50 cents.

In Montana, three forms of insurance are in practice: First, self-insurance; second, private insurance companies; third, State insurance. Reports for 62 employers with 24,649 employees show a loss cost, under the first plan, of approximately 75 cents for each \$100 of pay roll during the three years ending June 30, 1918; the system of self-insurance practically eliminates administrative expense. Under the second plan, for 915 employers with 11,000 employees the actual accident cost is quoted at \$1.04 per \$100 of pay roll, the total premium cost being practically \$3; while under the State fund system 1,017 employers with 14,060 employees paid 65 cents on each \$100 of pay roll as the actual accident cost, with a total premium cost of \$1.02. This report emphasizes the comparatively low cost of the State plan, considering the administration as well as other costs.

Administrative costs are again brought out in the report of the same State for the year ending July 1, 1919, which shows, for self-insurers a rate of accident cost of 75 cents per \$100 of pay roll, the total cost to the employer being of course the same. For company insurance the accident cost was 67 cents and the employers' cost \$2.25—considerable reduction from the 3 years previous; while in the State fund, the accident cost was 80 cents, and the total cost to the employer, \$1.

Montana is of course a State of relatively small population and of correspondingly limited industrial importance. The significance of the data given lies chiefly in their exact showing of relative costs. Of greater significance is the summary showing of experience under the law of New York, the most populous and the leading industrial State of the Union. An investigation of the systems of insurance in use in this State, which are the same as in Montana, shows the following results, self-insurers being left out of consideration in this comparison. State fund premiums are shown at the same rates as insurance companies, for comparative purposes.

LOSS AND EXPENSE EXPERIENCE, COMPENSATION INSURANCE IN NEW YORK, 1918.

Carrier.	Earned premiums.	Per cent of earned premiums.			
		Losses.	Expenses.	Losses and expenses.	Savings.
Stock insurance companies, nonparticipating....	\$22,534,589	51	36	87	13
Stock insurance companies, participating.....	1,198,072	44	17	61	39
Mutual insurance companies.....	4,580,722	44	20	64	36
State fund.....	3,982,678	41	6	47	53
Total.....	32,296,061	48	29	77	23

The investigator (Mr. Miles M. Dawson, F. A. S., F. I. A., consulting actuary) says of this:

Here the superior showing of the State fund is unobscured; its much lower expense makes the total net cost materially lower than in other insurance carriers.

Savings of nonparticipating companies (13 per cent) are profits and in nowise benefit the employers insured therein. In participating companies some portion of the 39 per cent of savings returns to insured employers as dividends, while in the case of mutuals 5 per cent goes to a catastrophe surplus and 31 per cent to dividends. Of the 53 per cent savings in the State fund, 14½ per cent are represented by reduced premium rates as compared with regular company rates, 5 per cent of the actual State fund rates go to a catastrophe surplus, while the remainder goes for the payment of dividends, thus saving to employers insured in the State fund 48¾ per cent of the earned premiums for the year, as compared with the full rates of insurance companies.

Taking the five years of operation of the fund, the saving to insurers is found to aggregate \$4,004,623, or 29 per cent of the total premiums computed at company rates. On this same basis, insurers in stock companies paid an unnecessary cost in excess of \$18,000,000 during the four and one-half years for which data are available; while at the same time beneficiaries would have received not less than \$5,700,000 more than they did, because of underpayments by insurance companies and self-insurers.

This authority regards "the grave undesirability of permitting self-insurance" as being fully demonstrated, and also "the wastefulness of insurance in insurance companies of the payment of compensation."

Another industrial State of the first rank, Ohio, has a State fund which is exclusive in its operation, insurance in stock companies or otherwise not being permitted. Of this it is said by a special investigator from outside the State:

The Ohio State fund, measured by the actual volume of benefits insured, has now become the largest carrier of compensation insurance in the United States. One or two private insurance companies, it is true, had a larger total of premium income in 1918, but 40 cents out of every dollar collected by these companies is absorbed by overhead expenses, whereas the whole income of the Ohio fund is devoted exclusively to the payment of compensation claims.

This fund is found by its investigators to be "highly solvent." It is, "and has at all times been, strong and solvent," while the report on the New York fund quoted from above speaks of that fund as "solvent and possessed of unimpaired reserves, at least equal in value to all liabilities, accrued or to accrue," with surplus for dividends, catastrophes, and fluctuations in experience.

The Pennsylvania State fund, like that of New York, is competitive. In the second annual report of this fund (1918) it is said that in the years 1916 and 1917 the State fund saved to its policyholders more than \$483,000 as against the costs that would have been incurred by insuring through the ordinary agencies. The saving for 1918 is estimated at more than \$450,000, while if all employers in the State carrying insurance at the time were insured in the State fund the savings effected would exceed \$2,500,000. "Absolute compensation protection with the best claim and inspection service" are offered by the State fund at a saving of from 15 to 25 per cent.

The Bureau of Labor Statistics is engaged in a rather extensive study of State funds, both exclusive and competitive, but no report is yet available. However, existing data show that in economy, fairness, promptness of payments, and general efficiency State funds are superior to any other form of insurance. This is indicated not only in the address by Commissioner Meeker above referred to, but also in his earlier address, "Lacks in workmen's compensation" (MONTHLY LABOR REVIEW, February, 1919). The various experts of the Bureau of Labor Statistics who have studied the question for the last 15 years have unanimously arrived at the same conclusion. It is impossible, however, to give at the present time as full an answer as is desirable.

IV.—Organization of State Funds.

THE administrative methods of each State fund are prescribed by the statute creating the fund. In the majority of cases a board or commission of three persons has charge of the fund as well as of the making of awards and the settlement of disputes. Notice of injury is received from the employer, and of claims from the employee. Investigations and reports, with special hearing where required, lead to the tentative determination of the amounts payable, subject to revision at such times and within such limits as the various laws provide.

The administrative board is purely a State agency, neither employer nor worker having any part as such in the management of the funds or the determination of its policies. Medical assistance is rendered in one State (Washington) under the supervision of local agencies in which there is representation of workmen and employers.

State funds do not employ agents or do advertising in the commercial sense. Of course, the reports of the commission are widely distributed, and the adjusters and inspectors of the office come in contact with employers generally, but there is no provision made for pushing business, such as is necessarily used by a commercial company.

Payments are made without the intervention of any other agency than the administration of the fund itself and the insured employers.

Therefore, the post office is used only as for any other matter deposited in the mails.

2. Practices as to methods of handling funds differ somewhat in the different States. However, a reserve is to be created and maintained adequate to care for any continuing liability, while in most of the States provision is also made for a catastrophe reserve. Annual reports as to the status of the funds are required; actuarial examinations are made from time to time, and the administrative board or commission is given authority to adjust premium rates or to regulate the number of calls for premiums so as to maintain an adequate reserve without the accumulation of excessive surpluses. Dividends may also be declared to avoid unnecessary accumulation of funds.

In three cases it was provided in the earlier acts that the employee should make some contribution to the State fund. These provisions have been gradually eliminated so that now a single State (Oregon) requires the workmen to make a contribution to the benefit funds, the amount being 1 cent for each day worked. In a few States the employee may be called upon to contribute to the medical aid fund but not to the fund for compensation.²

In a few States administrative expenses are borne in whole or in part by the State, but the tendency appears to be to make the system self-supporting. Reserves are required for continuing payments as well as for emergencies. Some laws establish rates on the basis of estimates submitted previously to their enactment, industries being classified in groups of approximately the same hazard. In other States the work of fixing rates is placed in the hands of the commission. The commission may also be charged with the duty of establishing risk classes, and the principle of merit rating is made use of to some extent.

Financial difficulties incident to the establishment of a new fund have been met in a number of cases by the advancement of a sum sufficient to enable the fund to begin work. Where a catastrophe has caused an overdraft on specific funds there has been gradual recoupment by the collection of premiums. This has occurred in but two instances, one in Washington, due to an explosion in a powder mill, and the other in West Virginia, where serious mine disasters led to heavy losses. Both these occurred early in the history of the funds involved, and in both States present solvency has been established.

No provision has been made for the relief of existing private insurance companies when an exclusive State fund has been established. In most cases the occasion for compensation insurance arose only contemporaneously with the creation of an exclusive State fund, so that no existing business, strictly speaking, was destroyed. Of

² Idaho, Montana, Nevada, Utah, and Washington.

course, accident insurance and employers' liability insurance were largely superseded by the establishment of the exclusive funds, but no compensatory or gradual reduction system has ever been adopted.

The establishment of a vigorous competitive State fund has, undoubtedly, resulted in the lowering of rates, though the number of such funds is as yet quite limited; strong mutual companies have had a similar effect in a few States.

It is of interest to notice that when the Canadian Provinces found it desirable to modify their existing compensation laws or to enact new ones, they investigated, through commissions, the workings and methods in use in some of the States of the Union. The result has been a strong commendation of the compulsory insurance system with an exclusive State fund as the insurance carrier. This has not been adopted in every Province, but the preponderance is strongly in favor of this method.

V.—Organization of Mutual Associations.

MUTUAL associations are found in various forms. As already referred to, the States of Kentucky, Massachusetts, and Texas maintain what might be called State mutual companies, officially recognized. As a rule, however, mutual companies are organized under general laws providing for the organization of such companies. A few States have specific provisions for mutual companies to carry compensation insurance. There are no separate provisions for particular employments, and so far as is known no provision is made for employee representation in the management of the associations. It is a common provision that business can be written only after a specified number of employers and employees are ready to be organized into a mutual association. The laws do not restrict their operation to single trades or districts. A summary of the provisions covering mutual insurance companies may be found in the Bureau's Bulletin No. 203, pages 290-296.

The laws contain a variety of provisions as to premiums, dividends, and reserves, and no single statement can be made covering these points. Reference to the summary noted above will indicate some of the methods in use. The States assume no responsibilities for the maintenance of funds of mutual associations other than is involved in official inspection, nor are employees privileged to contribute or to relieve the employer of his responsibility under the law.

VI.—State Regulation and Supervision.

PRIVATE insurance companies are formed only in accordance with statutory provisions of the State of domicile. They must also conform to the requirements of the laws of the various States in which they wish to transact business. Premium rates must, as a

rule, receive the approval either of the compensation board or of the insurance authorities of the various States.

Corresponding provisions relate to the organization of mutual associations, which are likewise subject to the scrutiny of the State superintendents of insurance.

2. Insurance departments exist in most States with power over companies transacting insurance business of whatever kind. They maintain a single State office, usually at the capital, and require reports at least annually, covering all financial transactions of all companies. They have also power of visitation and of requiring disclosures of all pertinent facts.

3. As to the cost of State supervision, insurance commissioners are salaried officials, but companies doing business in the various States are required to pay a license fee or tax, and also fees for audits and examinations of books and accounts. The practices of the States vary considerably, the fee going into the State treasury in some cases, and in others it goes to the inspector as payment for his services. Mutual and stock companies are on the same footing in this regard.

VII.—Cost of Compensation.

THE data on this point can be regarded only as tentative, the laws being of such recent enactment and the changes therein so frequent that no real basis of costs can be said to be yet determined.

The Pennsylvania Insurance Commission reported, in 1918, the pure premium costs of policies issued in 1916. This showed that for all industries the average was 63 cents per \$100 of pay roll; for all except coal mining, 48 cents; for anthracite mining, \$2.77; for bituminous mining, \$1.62; for building construction the rate was \$1.17; for iron and steel manufacturing, 86 cents; manufactured products of clay, 73 cents; chemicals, 78 cents; textiles, 17 cents; wood products, 57 cents, etc. These figures, of course, do not include the cost of administration, which varies with the type of insurance, being least with the self-insurer and greatest with stock companies.

The combined policy years 1916 and 1917 show an audited pay roll of \$2,715,747,000; earned premiums amounted to \$30,842,928, while the losses incurred were \$15,634,248. The average premium rate was \$1.14; the pure premium, 58 cents; and the loss ratio 51 per cent.

An illustration of the relation of costs to pay rolls and premiums may be taken from the report of the State fund of Montana. In 1918 private employers in the State fund had a pay roll of \$10,747,628, on which premiums amounting to \$157,639 were paid; \$52,512 were paid as total compensation benefits during the year. For the fiscal year ending June 30, 1919, there was a premium income of \$181,709. Of this 16 per cent went for temporary total disability, 8 per cent

for permanent partial disabilities, 8 per cent for fatal injuries, 3 per cent for medical and hospital benefits, and 0.8 per cent to undertakers. During the same time compensation payments amounted to \$68,708. Of this 44 per cent was for temporary total disability, 22 per cent for permanent partial disability, an equal amount for fatal injuries, 8 per cent to physicians and hospitals, and 2 per cent for burial.

The State fund of West Virginia was contributed to in 1917 by 2,644 employers, with a wage roll of \$125,220,220. The premium income was \$1,762,238, or at an average premium rate of \$1.41 per \$100 of wages. The losses during the year amounted to \$1,319,144, or \$1.05 per \$100 of wages and 75 cents per dollar of premium income. The administrative expense was \$80,732, or \$4.58 per \$100 of premium income. Summarizing the experience of four years' operations, the average premium rate was \$1.25 per \$100 of wages, and the average losses, \$1.17; losses amounted to 94 per cent of the premium income. Administrative expense averaged \$5.05 on each \$100 of premium income.

The benefit provisions of the various acts differ considerably so that to make a comparison between them requires a comparison of a number of factors. The Massachusetts report for the year ending June 30, 1917, shows the loss experience of that State for a period of five years on the basis of the average cost per benefit case for the different kinds of payments. This information is presented in tabular form as follows:

AVERAGE COST PER BENEFIT CASE IN MASSACHUSETTS, YEAR ENDING JUNE 30, 1917.

Type of payment.	First year.	Second year.	Third year.	Fourth year.	Fifth year.
Medical.....	\$11.04	\$9.79	\$9.36	\$9.32	\$10.09
Fatal.....	1,368.65	1,780.63	2,970.21	2,603.06	2,630.74
Nonfatal.....	58.65	87.27	91.65	85.44	69.60
Total.....	40.53	43.58	43.38	43.56	38.98

It is evident that no uniformity has been reached in the five years' experience above set forth. The report offers but one explanation for some of the rather marked variations, which is that "it may possibly be that industrial conditions are in part responsible."

Various lines of approach to the problem of costs are suggested by the different kinds of data above reproduced. Reference may also be had to data given under III (page 21), for some suggestive figures, but the subject has not yet received the attention that its importance warrants. This is excused in the minds of some by saying that the cost of compensation is really but the cost of industrial injuries, and the community has borne this in the most burdensome and uneconomical and unjust way hitherto; so that the question is only one of incidence, newly adjusted by the new legislation;

but the actual amounts will doubtless be brought into fuller consideration with the growth of an intelligent appreciation of the value of data showing the importance of accident prevention as well as of relief.

It is difficult to say whether or not costs have risen in recent years, in view of the comparatively brief experience already noted. The pressure for production and the influx of unskilled workers into industry had a tendency to increase the accident rate in 1917 and 1918, but the actual influence of this fact on insurance costs is not yet known.

VIII.—Benefits.

IT WILL be necessary to advert to the laws themselves or the Bureau's analytic Bulletin No. 240 for an answer to the question as to the amount of benefits paid. It is in most cases a percentage of the wages earned at the time, ranging from 50 to 66 $\frac{2}{3}$. Only actual dependents receive compensation, and, as a rule, in periodical payments rather than lump sums. Supervision of the expenditures of lump sums is very slightly practiced and that in a rather unofficial way.

2. Disability benefits begin at the expiration of a waiting time which varies from three to fourteen days under different laws. Usually the same percentage of wages is paid regardless of the period of the disability.

3. A few laws reduce the benefits where there is marked fault on the part of the workman and increase them where the employer is guilty of negligence in a marked degree. However, it is the common rule that the fixed schedule is paid in all cases.

4. A majority of the laws contain fixed schedules for specified injuries, chiefly dismemberments. In California and Nevada the laws take cognizance of the age and occupation of the injured person; while in a number of other States, if the employee is a minor or a learner, the fact that an increase in the earning capacity is normally to be expected is to be considered.

5. Relatively few of the laws make disfigurement apart from disabling injuries a basis of awards. Where the provision exists, there is usually a maximum limit fixed by the law, the actual amount being subject to determination by the administrative commission.

6. Medical and surgical aid are included at the present time in practically all laws, though omitted from some in their first enactment.¹ Where it is required, it is to be given in all circumstances immediately on the happening of the injury, but may be limited to brief periods as in some laws, or continued until recovery or a final determination of the status of the injured person. The laws vary as to the methods of administration, the more common provision being

¹ See chart at end of this article.

that the employer shall furnish the physician. In some States the right of the employee to make the selection is reserved: while in Washington, local medical aid boards are charged with the administration of this form of relief.

IX.—Old and Infirm Workers.

NO CONCLUSIVE figures are available on this subject. Proposals to permit workers of these classes to contract out of the law are generally disapproved. In most States special provision is made to limit the liability of the employers taking on partially disabled workers, as by the loss of one hand or one eye, so that a second injury will not entail upon the current employer a liability as for total disability.

X.—Relation of Accident Insurance with Any Other Forms of Insurance.

ACCIDENT insurance stands alone so far as being correlated with sickness or invalidity insurance is concerned. Some laws authorize the formation of relief associations to which employees may contribute, added benefits in excess of those required by the compensation laws being payable. No State of the Union has thus far enacted legislation providing for sickness or invalidity insurance.

XI.—Malingering.

SO FAR as reports indicate, malingering can not be regarded as at all prevalent. Cases are, of course, known, and it is a part of the work of the administrative boards to keep in touch with injured workmen, chiefly through medical channels, so as to prevent the practice. This point is discussed on page 289 of the MONTHLY LABOR REVIEW for November, 1919, where the opinion of Commissioner Meeker is expressed after a very general consideration of the subject.

XII.—Accident Prevention in Connection with Workmen's Compensation.

LACK of thorough statistical reporting makes it impossible to decide what effect workmen's compensation laws have had on the number of accidents. It is the general impression that the tendency is to lead to a reduction of accidents, especially where mutual companies insure or where there is merit rating.

A number of the laws contain special provisions with regard to safety regulations, either actually prescribing such regulations or penalizing persons who disregard existing regulations. In some States the administration of compensation laws is in the hands of the same department or commission that has charge of inspection and safety;

in others there are various degrees of correlation between such administrative board and the labor commissioner or inspection department of the State.

XIII.—The Determination of Claims.

THERE is a wide variety in the modes and degrees of supervision of direct settlements by administrative authorities. In the States having the better practice, and they constitute a considerable number of the total, settlements are open to review by the commission, and are not to be considered as binding or final until approved. Most States have special administrative commissions; in a very few the power of awards and adjustment is vested in the courts, usually in summary proceedings.¹ In a few cases, special arbitration boards or tribunals are to be selected for the individual case, a single State official constituting the permanent factor of administration. In many cases the board or tribunal has the power to hold hearings and procure evidence; its findings are usually binding so far as facts are concerned, though appeals may be taken on matters of law. The status of administrative boards has been considerably discussed and reference may be made to "Exercise of judicial power" in Bulletin No. 203 (pp. 180-182).

The medical aspect of the case is dealt with by the same tribunal and at the same time as other aspects. Some of the State boards have permanent medical advisers, while others depend on designated physicians and the report of the practitioner in the case.

Little organized work is done in the way of furnishing expert assistance to claimants. The view has been expressed that it is a proper function of the State to enable inexpert or illiterate claimants to secure their rights under the laws, but so far as is known, there has been no general adoption of this view. The expense incurred in the settlement of disputes is borne by the parties litigant. Some laws limit the amount that an attorney may charge, but no State provides for any additional sum to meet costs. Some require filing or recording to be done by court officials, free of charge. Delay in the payment of awards subjects the delinquent party to a penalty in a number of States; others allow interest on payments withheld during an appeal if the award on the appeal is approved. It is impossible to give any average time elapsing between the date of claim and the payment of benefits. Few offices are allowed adequate administrative force such as would be necessary for prompt and accurate adjustments.

The extent of litigation is difficult to discuss. While the number of appeals and court trials prove positively that the laws have not

¹ See chart at end of this article.

succeeded in entirely doing away with action at law, the number of cases settled without litigation is greatly in excess of those in which it is resorted to. For instance, the Montana commission reports deciding 6,000 disputes, out of a much larger number of claims referred to it for determination, without a single appeal being taken to a law tribunal.

XIV.—Revision of Existing Law.

CONSTANT changes are being made by way of amendments in the laws of the various States. These relate not to the principle involved, but to administrative details and to degrees of liberality. For instance, it was true only quite recently that a majority of the laws provided as benefits 50 per cent of the wages. Now more than half pay 60, 65, or 66½ per cent. A waiting period of two weeks or more was embodied in a majority of the earlier laws, but now this has been reduced, in a majority of the States, to periods of less than two weeks; 21 States fix seven days as the waiting period. The fear that compensation laws would levy an intolerable burden on industry has practically disappeared. It has become more generally recognized that the burden of the individual injured is a reality, and that the mere transference of it from the unassisted worker with no capacity to shift the burden, to the responsible industry as represented by the employer, with means of distribution of costs in his hands, was not in any sense an increasing of the burden but rather the placing of it where it properly belonged. This fact is not yet recognized in all jurisdictions, or by all parties in interest; and the limitations on persons covered, on medical benefits, and on periods of payment in case of death or total disability, yet call for persistent and intelligent action to secure adequate compensation laws. Organized labor is naturally most able to express itself in behalf of liberality, and many of the more enlightened employers are ready to give frank consideration to demands for more liberal provisions.

XV.—Voluntary Insurance.

THE laws of a number of States absolutely exclude certain classes of labor, those notably being domestic and farm labor. In a number of States in which hazardous employments are designated as covered by the laws, permission is given for voluntary choice by employers and employees in other industries to accept the terms of the law. Some consideration is being given to the inclusion also of independent workers, while employers in small industries are already given permission to come under the provisions of the laws in a few States.

INDUSTRIAL RELATIONS.

Report of the President's Industrial Conference.

THE Industrial Conference called by the President, which was convened on December 1, 1919, made public a preliminary report on December 29, setting forth a tentative plan of machinery to adjust disputes by conference, conciliation, inquiry, and arbitration. The purpose in publishing this preliminary report, which was reprinted in the MONTHLY LABOR REVIEW for January, 1920 (pp. 60-68), was to obtain, as early as possible, constructive criticism of the proposed plan while the conference was engaged in its further development.

On March 6, 1920, the conference issued its final report, setting forth a program to combat industrial unrest. This report (1) modifies the tentative plan for the adjustment of disputes, (2) suggests the development of employee representation as a method of preventing disputes, and (3) makes recommendations as to methods of dealing with certain problems affecting the employment relationship.

The conference declares itself in favor of the policy of collective bargaining and provides for the unrestricted selection of representatives by employees, but leaves the question of an open or closed shop to be settled in each factory or plant as local conditions determine.

The guiding thought of the conference has been that the right relationship between employer and employee can be best promoted by the deliberate organization of that relationship. That organization should begin with the plant itself. Its object should be to organize unity of interest and thus to diminish the area of conflict, and supply by organized cooperation between employers and employees the advantages of that human relationship that existed between them when industries were smaller. Such organization should provide for the joint action of managers and employees in dealing with their common interests. It should emphasize the responsibility of managers to know men at least as intimately as they know materials, and the right and duty of employees to have a knowledge of the industry, its processes and policies. Employees need to understand their relation to the joint endeavor so that they may once more have a creative interest in their work.

Plan for the Settlement of Disputes.

THE modified plan for the settlement of disputes limits the field of arbitration and, by making machinery available for collective bargaining, enlarges the field of voluntary settlement by agreement. The plan has been extended to include the service of public employees and to cover disputes affecting public utilities other than steam railroads.

The plan involves no penalties other than those imposed by public opinion. It does not impose compulsory arbitration. It does not deny the right to strike. It does not submit to arbitration the policy of the "closed" or "open" shop.

The plan for adjustment consists of a system, nation-wide in scope, with a national industrial board, local regional conferences, and boards of inquiry whose functions are defined by geographical rather than industrial limits. In brief, the plan is as follows:

The Regional Adjustment Conference.

The parties to the dispute may voluntarily submit their differences for settlement to a board, known as a Regional Adjustment Conference. This board is to consist of four representatives selected by the parties in accordance with rules laid down by the National Industrial Board for the purpose of insuring prompt and unrestricted choice of such representatives; and four others from the industry involved in the dispute, two of whom are to be chosen from a panel of 12 representatives of employers and two from a panel of 12 representatives of employees. These panels of employers and employees for each region shall be prepared by the Secretary of Commerce and the Secretary of Labor, respectively, after conference with the employers and employees, respectively, of the regions. These panels are to be approved by the President. In case either side objects to the representatives of the other on the ground that they are not in fact representative, the chairman may pass upon such objection, or he may call in some competent person to do so. If the chairman is in doubt as to whether the representatives objected to are in fact representative, he may require that formal action be taken by the employer to select, and properly to certify to the selection of his representatives; and likewise, unless otherwise provided by the National Industrial Board, he may require the employees to elect their representatives by secret ballot, under the direction of some impartial person, designated by the chairman. The board is to be presided over by a regional chairman, representing the public interest, and appointed by the President, who is to act as conciliator. If a unanimous agreement is reached, it results in a collective bargain having the same force as a trade agreement. If the conference fails to agree unanimously, the matter goes, with certain restrictions, under the agreement of submission, to the National Industrial Board, unless the parties prefer the decision of an umpire selected by them. The decision of the umpire is to have the same effect as the unanimous agreement of the Regional Adjustment Conference. The voluntary submission to a Regional Adjustment Conference carries with it an agreement by both parties that there shall be no interference with production pending the processes of adjustment. The Regional conference is to obtain its facts through the voluntary action of parties to the dispute.

The Regional Board of Inquiry.

If the parties, or either of them, refuse voluntarily to submit the dispute to the agencies provided by the plan of adjustment, a Regional Board of Inquiry is to be formed by the regional chairman, consisting of two employers chosen from the top of the employers' panel for the industry concerned and two employees from the top of the employees' panel for the craft concerned, none of whom are parties to the dispute. This board has the right, under proper safeguards, to subpoena witnesses and records and the duty to publish its findings as a guide to public opinion. Either of the parties at conflict may join the board of inquiry on giving an undertaking that, so far as its side is concerned, it will agree to submit its contention to a Regional Adjustment Conference, and, if both join, a Regional Adjustment Conference is automatically created.

The National Industrial Board.

The National Industrial Board, with headquarters at Washington, is to have supervisory power over the working of the plan. The board is to be composed of nine members appointed by the President and confirmed by the Senate. Three of the members are to be chosen from representatives of industrial employers, three from representatives of industrial employees, and three are to represent the general public. One of the latter is to be selected by the President as chairman. All are to be selected without regard to political affiliations.

Public Utilities and Public Employees.

The plan is applicable also to public utilities, but in such cases the Government agency, having power to regulate the service, has two representatives in the Adjustment Conference. Provision is made for prompt report of its findings to the rate regulating body.

The conference makes no recommendations for a plan to cover steam railroads and other carriers, for which legislation has recently been enacted by Congress.¹

The plan with substantial modifications is also applicable to public employees. In this case the Regional Adjustment Conference is to consist of two representatives from the legislative branch of the Government authorized by law to make appropriations, two representatives from that branch or department of the Government which is in the position of employer, two representatives from the employees in the class of public service in which the question arises, and two members to be selected by the representatives of the employees from the first 12 names on the general panel.

¹ The labor provisions of the new transportation act are printed on pages 53 to 57 in this issue of the MONTHLY LABOR REVIEW.

A Regional Adjustment Conference is to be convened by the chairman on the request of the administrative head of any department of the Government standing in the relation of employer or on the request of such a substantial number of the employees as to satisfy the chairman that the question is of sufficient importance to justify the convening of a Regional Adjustment Conference.

If the Regional Adjustment Conference reaches an agreement, its report is to take the form of a recommendation to the appropriate legislative body as a basis for appropriations. If the conference does not reach an agreement, no report is to be made unless the legislative body requests such report.

In the case of public employees there is to be no board of inquiry, but all material facts and information are to be made available to the Regional Adjustment Conference. There is to be no appeal to the National Industrial Board and no reference to an umpire.

Findings of any adjustment machinery in the case of public employees must necessarily have the force merely of recommendations to the Government agency having power to fix wages, hours, and working conditions of the employees concerned. As a matter of principle, the Government is not in a position to permit its relations with its employees to be fixed by arbitration. The plan as modified for public employees therefore avoids arbitration.

Prevention of Disputes.

THE definitely formulated industrial disputes adjustment plan proposed by the Conference is a method for settling industrial quarrels after they arise. It is not intended to prevent the germination of disputes. Prevention of the quarrel, in the opinion of the Conference, is, however, worth more than cure. The Conference suggests, as a suitable means of prevention, the further application and development of the principle of employee representation.

The shop committee idea is recommended as being admirably calculated to minimize the serious results of that loss of personal contact between employer and employee which is an inevitable result of modern industrial organization. Employee representation will provide, the Conference believes, "an established channel of expression and an opportunity for responsible consultation on matters which affect them [the employees] in their relations with their employers and their work." It will not only better enable the employee to advance his own interests but will make him more definitely conscious of his own responsibility. It provides the machinery which is necessary (whether the establishment is unionized or not) for adequate discussion and settlement of purely local, establishment problems.

Employee representation, in the opinion of the Conference, "must not be considered solely as a device for settling grievances. It can find success only if it also embodies cooperation in the problem of production. Whatever subjects the representatives come to feel as having a relation to their work, and their effectiveness as members of the plan, may come within the field of committee consideration." The Conference remarks upon the necessity for absolute freedom in the selection of representatives and for frequent and regular meetings of employee and management representatives. "All employees," in the judgment of the Conference, "must feel absolutely convinced that the management will not discriminate against them in any way because of any activities in connection with shop committees."

The Conference believes that the opposition to the employee representation idea which has manifested itself among large employers "who still adhere to the theory that labor is a commodity" is "steadily disappearing" and hopes that it will entirely vanish. The other source of opposition is seen in those trade-union leaders who "regard shop representation as a subtle weapon directed against the union." The Conference suggests that this idea "is apparently based on the fear that it may be used by some employers to undermine the unions." This attitude the Conference believes to be "based on a misconception of the possible and desirable relations between the union and the shop committee. This relation is a complementary and not a mutually exclusive one. In many plants the trade-union and the shop committee are functioning harmoniously. In some establishments the men are unionized, and the shop committees are composed of union men. In others, some men belong to the trade-union, while all belong to the shop organization."

Employee representation is by no means suggested as a panacea. The Conference realizes that it "offers no royal road to industrial peace. It is only a means whereby sincerity of purpose, frank dealing, and the establishment of common interests may bring mutual advantage."

Problems Affecting Employment Relationship.

Collective Bargaining.

THE Conference balances the "right to bargain collectively" against "the right to refuse to bargain collectively," and asserts that "as abstract rights both undoubtedly exist." As a group of public men, however, they favor the acceptance by the employer of the policy of bargaining collectively, having reliance upon good faith for the enforcement of the bargain. The declaration of the Conference in favor of the policy of collective bargaining is as follows:

The Conference is in favor of the policy of collective bargaining. It sees in a frank acceptance of this principle the most helpful approach to industrial peace. It believes

that the great body of the employers of the country accept this principle. The difference of opinion appears in regard to the method of representation. In the plan proposed by the Conference for the adjustment of disputes provision is made for the unrestricted selection of representatives by employees, and at the same time provision is also made to insure that the representatives of employees in fact represent the majority of the employees, in order that they may be able to bind them in good faith.

Hours of Labor.

The Conference recommends neither the 8-hour day nor the 48-hour week, but it does state "that a schedule of hours substantially less than the 48-hour standard is not at this time desirable except in industries where a scientific study of the problem indicates that such a reduction is necessary for the protection of the health and safety of the workers and is in the public interest."

Three recommendations are made: (1) That hours of work should be considered from the point of view of the welfare of the workers and of the efficient utilization of the country's resources over a long period of time; (2) that study should be made in each industry, preferably by the industry but in its default by the appropriate government agency, of the problem of industrial fatigue in relation to production and to the health of the workers; and (3) that hours of labor schedules should be arranged on a weekly basis and overtime be permitted only in case of temporary necessity.

Women and Children in Industry.

The Conference recommends that women doing work equal in quantity and in quality to that of men working under similar conditions should receive equal pay. In respect to child labor it urges all States not having adequate legislation with reference to child labor and compulsory education to "give these topics prompt and sympathetic consideration."

Housing.

Housing is declared by the Conference to be primarily a community problem. Home ownership by the workers is urged, "with protection against the dangers of real estate speculation and exploitation." The function of the State and Federal Governments is to be largely one of study and investigation of housing problems, the State further concerning itself with the enactment of proper building and housing codes.

Wages, Profit Sharing, and Thrift.

The Conference recommends the establishment of wages "on a basis of justice to employees" and asserts its belief that profit sharing "properly adapted to the character of the individual business and carried out in a spirit of genuine mutuality may often better industrial relations."

The Conference believes that the alternative to insurance against sickness and old age lies in a wage adequate to cover these items, and suggests that the Federal Government should conduct a careful, authoritative investigation of the whole subject. "It feels that such investigation could well include such items as the possibility of converting the great multitude of small Liberty loan investments in the country (with all the attendant difficulty of collecting small amounts of interest) into some form of old-age annuities."

Agriculture and the Cost of Living.

The Conference asserts its belief that agricultural production is profoundly influenced by the competitive conditions between the factory and the farm, as to wages, hours, and conditions of work, and feels that "it would be a disaster to exaggerate industrial development at the cost of agriculture."

Cooperation among consumers in the purchase of their supplies and among producers in the marketing of their products is suggested, which in the opinion of the Conference will tend to stabilize both demand and supply and offer legitimate opportunity for reduction in the price margin between producer and consumer.

Since changes in the cost of living, and the readjustments they make necessary, must continue to be significant, it is vitally important that the Government maintain and even extend its machinery for investigating and reporting upon this phase of the industrial situation. * * * The Conference hopes that adequate appropriations for the continuance of effective investigation work and the publication of results may not be lacking.

Public Employees.

The Conference states its belief that, although utmost liberty of action should be accorded public employees in the matter of their association for the advancement of their common interests, policemen, firemen, and others whose duties relate to the administration of justice and the preservation of life and property should not be allowed to affiliate with organizations which authorize the strike. The Conference was unable to agree upon any recommendation as to the propriety of the affiliation of other classes of public employees with such organizations.

Employment and Unemployment.

The Conference urges "an immediate and thorough study of the problem [of unemployment] by individual industries so that analysis of the conditions in each may suggest appropriate measures of amelioration. Otherwise the country will be confronted with the demand for legislation still on trial in those countries which have adopted it, and will be without the information necessary to a wise choice of remedies."

The Conference recommends establishing a "system of employment exchanges, municipal, State, and Federal, which shall in effect create a national employment service."

Conclusion.

IN CONCLUSION the report states:

In presenting these recommendations the Conference desires to emphasize that they are not merely designed to tide over a troublesome period of economic readjustment. Many of the evils which we have pointed out were in existence before the war, and will remain in existence, if steps are not taken to remedy them. The machinery of cooperation and adjustment which we recommend we believe to have permanent value as an agency of industrial progress. At the same time, it should be borne in mind that to-day, when the sense of the magnitude and danger of social unrest is still acutely upon us, when we have not yet reverted to settled habits of thought and action, when our economic life is still in a state of readjustment, it may be possible to establish ideals and set up machinery which the inertia of a later day may defeat. Not with any feeling of panic, not with any hysterical haste, but sanely and sensibly we urge that these reforms be put into effect. And we do so with the belief that they will not only contribute largely toward the elimination of the causes of industrial strife, but that they will make for the introduction, in American industry, of those democratic principles which constitute the most precious heritage of the American citizen.

Report of the United States Bituminous Coal Commission.

THE strike of the bituminous coal miners which occurred during November, 1919 (see MONTHLY LABOR REVIEW for December, 1919, pp. 61-78), was brought to an end when the miners agreed to accept the President's proposal that they accept the 14 per cent wage increase fixed by the fuel administrator and his offer to appoint a tribunal to consider the whole matter and review the reasonableness both of the wages at which miners start work and of the Government prices for coal. This commission was appointed on

December 19, 1919, and was composed of Henry M. Robinson, representing the public, afterward elected chairman; Rembrandt Peale, representing the operators; and John P. White, the miners. The majority report, dated March 10, 1920, and signed by the chairman and Mr. Peale, has recently been accepted by the President as the report of the commission. A minority report by Mr. White is made a part of the general report.

The Majority Report of the Commission.

AT THE first hearing, January 12, 1920, an agreement proposing to submit the controversial matters to the commission and to abide by its awards was reached between Mr. John L. Lewis, president of the United Mine Workers of America, and the operators in all the districts except the Southern Appalachian Coal Operators' Association; Alabama Coal Operators' Association; Colorado Fuel and Iron Co.; Operators' Association of Western Kentucky; New River Field of West Virginia; Georges Creek Coal Operators Association of Maryland. Statements from these operators' submitted to the commission showed that existing conditions peculiar to their particular industries prevented their taking part in the deliberations. All the operators, however, emphasized their legal inability to agree to fixed prices, and this matter was therefore not considered in the majority report.

Procedure.

Since the wages of the central competitive field consisting of the States of Illinois, Indiana, Ohio, and western Pennsylvania, have for many years been used as the basis for wages and agreements in outlying districts, the commission adopted the following method of securing necessary information regarding the industry. First, it heard the statements and demands of the miners and the operators of this field, respectively; then those of the miners and operators from other districts, and finally, in order to ascertain actual conditions in regard to the stability and distribution of the coal supply throughout the country, the statements of consumers generally.

Demands of Miners and Counterclaims of Operators.

The position of the miners as presented by President John L. Lewis, of the United Mine Workers of America, was as follows:

1. That there be a 60 per cent increase upon all classifications by day labor, tonnage, yardage, and day work in the central competitive field. That, of course, carries with it that the basis of understanding reached in the central competitive field on the part of the mine workers would be satisfactory in all outlying coal-producing districts.
2. That a six-hour day, five days per week, be established.

3. That the day labor be paid time and a half for overtime and double time for Sundays and holidays.
4. That pay days shall be upon a weekly basis.
5. That the double shift of work on coal for commercial tonnage be abolished.
6. That the automatic penalty clause be abolished.
7. That the internal differences not covered by interstate joint agreement shall be referred back to the respective districts for adjustment.
8. That any contract negotiated be effective from and after November 1, 1919, to run for a period of two years from that date.

Presenting their counterclaims, the operators asked:

1. That the present system of collecting dues and initiation fees for the mine workers and enforcing the payments thereof by deductions from their earnings through the officers of the operators be abolished.
2. That the commission fix an equitable method for dealing with house rent charged mine workers and the price charged the miners for domestic coal.
3. That the commission recommend to the Congress of the United States the enactment of legislation requiring associations of employees, which make contracts of employment with employers, to take such action as will make them legally responsible for the fulfillment of the contracts so entered into.
4. That the national officers of the United Mine Workers of America and the national organization being parties to the making of the contract be required to assume responsibility for enforcing the terms of such contracts in the various districts, notwithstanding the present limitations in the constitution of the United Mine Workers of America.
5. That the contract shall provide that time clocks or time devices may be installed at mines and that the miners and inside day men be required to register when they enter or leave the mines and that the outside day force be required to register when they arrive at or leave the mines. All men refusing to comply with such requirements to be subject to discharge.
6. That the commission in its award provide for the introduction of devices or machinery which may serve to reduce the cost of coal and consequently the cost to the public for which there is no scale of wages in the then existing contract.
7. That whatever contract the commission works out or recommends should expire on the 31st of March, 1922; that contracts should expire in the spring and should stand for a two-year period.

The Award.

The provisions of the award may be summarized as follows:

1. Unless otherwise ordered the terms and conditions of the Washington agreement of October 6, 1917, shall continue.
2. The 14 per cent increase in wages fixed by the Fuel Administration is eliminated on March 31, and replaced by this award (which is on a 27 per cent basis).
3. The agreements drafted under this award are to take effect April 1, 1920, and continue until March 31, 1922.
4. The mining prices for mining mine-run coal, pick and machine, are advanced 24 cents.
5. All day labor and monthly men are advanced a dollar a day, except trappers and other boys, who are advanced 53 cents a day.
6. All rates for yardage, dead work, and room turning are advanced 20 per cent.

7. The fulfillment of all joint and district agreements are to be guaranteed by the officers of the international organization.

8. The eight-hour day is retained.

9. The practice of car pushing stands, but with recommendations for careful consideration of ways and means for the introduction of ameliorating practices.

10. Rules are set up under which new machinery can be introduced in the mines and thoroughly tested.

11. A commission is set up for the central competitive field to handle questions of differentials in rate and certain other matters.

12. If the recommendations of the President's Industrial Conference are adopted in regard to industrial tribunals and boards of inquiry, this machinery is to be put into use in the coal industry. Otherwise a special board is to be set up.

13. Explosives are to be furnished miners at cost, cost to include handling, transportation, and insurance.

14. House coal is to be furnished to the miners at the tippie at the price they were paying on October 31, 1919, plus the average percentage allowed as an increase on the wage scale, i. e., 27 per cent—the miners to pay for delivery at cost.

15. Charges for blacksmithing are not to exceed three-quarters of 1 per cent of the miners' gross earnings.

16. Special boards are to be set up for the Kanawha, Paint Creek, and Cabin Creek fields; for District No. 12, Illinois, including Assumption and Decatur, Ill.; also for the State of Washington; each commission to handle specific local conditions.

Summary of Recommendations.

The report recommends:

1. That an Executive order be issued instructing departments and Federal agencies to buy and store the winter's supply of coal before July 1 of each year.

2. That the Council of National Defense assume the duty of obtaining the support of the general public for coal storage.

3. That an Executive memorandum be issued to the Interstate Commerce Commission, to the end that the commission may aid in the solution of the transportation problems outlined, with particular attention to the question of seasonal freight rates, car supply, and car distribution, as well as the problem of railway coal purchase for storage.

4. That the governors of the various States be asked to issue executive orders to State institutions and departments for the purchase and storage of winter coal during the summer months.

5. That State railway and public utility corporations use their influence with the various utility commissions to induce the pur-

chase and storage of coal by those corporations, reflecting, if necessary, the cost of such storage in the rates.

6. That a copy of this report go to the railroads to the end that they may cooperate in regard to coal storage, car construction and distribution, and the reduction to a minimum of the practice of commandeering coal.

7. That a copy of this report be transmitted to the Federal Reserve Board, to the end that Federal reserve banks may favor, as eligible for rediscount, paper drawn against coal in storage.

8. That the Interstate Commerce Commission, State railway and public utility commissions within their jurisdictions issue, where lawful, rules controlling car distribution among mines, to the end that no particular mine or mines may be permitted to obtain, through a practice of car assignment and car guaranties, preferential car service.

9. That the practice whereby purchasing agents of carriers can use company control over car supply to force down the price of railway fuel be abolished.

10. That operators avoid the use for railroads of coal whose properties make it more valuable for other purposes.

11. That camp and housing conditions be improved.

12. That the good offices of the miners' international organization be exercised to maintain their expressed position favoring the introduction of labor-saving devices and machinery.

13. That the making of advances on miners' pay be discouraged in every way, but if made, that they be made without discount, either directly or indirectly.

Wages.

Among the questions bearing upon numerous phases of the industry dealt with in the report those of wages and irregularity of employment assume the largest proportions.

In deciding to substitute a 27 per cent increase in wages for the 14 per cent fixed by Mr. Garfield, the former fuel administrator, the commission states that it was guided by the principle that "every industry must support its workers in accordance with the American standard of living"; moreover, that in a consideration of this principle it took into account the increased cost of living as shown by estimates submitted by the operators and by those shown in late official reports of the United States Bureau of Labor Statistics, increases paid workers in other industries, and various other factors.

This percentage of increase was based upon percentages reached for the different classes of work and of workers in the industry estimated on a tonnage basis.

The increase was apportioned among the different bodies of workers and classes of workers as indicated in the award, and applied to the

rates paid on October 31, 1919. The report estimates that on this basis the average increase to tonnage workers will be 31 per cent over that in 1919, and for day men it will amount to an average increase of 20 per cent. While there seems to be an apparent inequality in such an apportionment, the commission considers it a fair one, since under the award of October 6, 1919, the day men received a rate considerably in excess of the advance given to the tonnage workers.

It is estimated that the 27 per cent increase will amount to an increase in wages of approximately \$200,000,000 above what they were October 31, 1919, and the question of vital interest to the consumer is whether or not this added expense will ultimately be passed on to the public. In the opinion of the commission this depends upon competitive conditions, but it offers this hope: "We estimate that the carrying out of other provisions of our findings will save the general public more than the cost of the additional wages. It is to be expected that when all Government regulations are withdrawn and a competitive market for coal is reestablished, the over-expansion of the industry will not permit the operators to add to the price of coal all the increased compensation granted to the miners."

The contention was made by the operators who submitted figures to illustrate their case that often the miners do not avail themselves of all opportunity for work and that miners who work three-fourths of the available time earn sufficient wages. These figures, the report states, were found defective in two respects: (1) No allowance is made for turnover; (2) conditions in the mines resulting from the nature of the industry may limit the possibility of employment even though the mine is open. The commission found, however, even after all allowances had been made, a margin of unemployment directly attributable to the miners themselves.

In view of the generally accepted opinion regarding the relation which the increased wages paid for labor bears to a rise in the price of coal, the commission finds that—

We have evidence that the share of labor in the total price paid by the public for coal was greater in 1916 and in 1917 than in 1918 for most of the important producing districts. Hence the advance granted to labor by this commission will tend to reestablish the prewar distribution of each dollar paid for coal as between capital and labor.

The increase will thus in no way be a further step in the circular ladder of more wages—higher prices—increase in the cost of living—still more wages.

Irregularity of Mining Operations.

The irregularity of mining operations resulting as it does in an intermittency of working-days is a primary cause of much of the unrest prevailing in the industry and of the high prices of coal.

This irregularity the commission attributes to two principal causes: (1) The seasonal character of the market; (2) the inadequacy and

irregularity of car supply. Statistics submitted in support of these statements show that in 1918 when the demand for coal was at its maximum the principal cause of loss of time was car shortage which amounted to 49 per cent, while in 1919, after the war demand was past, "no market" was responsible for 50 per cent of the idle time. Labor shortage and strikes accounted for about one-fourth of the lost time in each year and mine disability for 14 per cent in 1918 and 6 per cent in 1919.

The seasonal character of the demand which forces the operators to keep a reserve force large enough to meet the peak of the demand operates to produce unemployment in seasons of "no market."

For these reasons the commission strongly urges the consuming public on the one hand and the carriers on the other to aid in stabilizing the industry and in regulating the irregularity of the market, the public by purchasing and storing its coal in the spring and summer; the carriers by arranging to furnish all possible equipment when necessary and without discrimination.

The fact is brought out that for many years the railroads, which consume about 30 per cent of the total coal production, have, when necessary, been in the habit of commandeering coal consigned to other consumers, and that public utilities have also followed this practice to some extent.

The commission has therefore requested the executives of the larger systems to move coal in excess of their needs during months of low movement to consumption terminals, so as to accumulate a three months' supply by winter and to have 20 or 30 days' supply on hand in the spring. The economy thus practiced will, it is thought, offset to a large extent the increased cost of storage. Public utilities and the steel industry, the next largest consumers, are urged to increase their storage of coal and movement of the same during the summer months, as are also Government institutions, Federal, State, and local.

These and other recommendations which, if carried out, the commission believes, will do much to stabilize the coal industry, afford a considerable measure of relief to the carrier, and effect a saving for the public, are found in the summary of recommendations on pages 43 and 44 of this number of the **REVIEW**.

The overdeveloped condition of the industry is another cause of unemployment among the miners. According to the report, America, at the present time, requires less than 500,000,000 tons of bituminous coal per annum, while the mines are capable of producing 700,000,000 tons. Overdevelopment naturally increased during the war, with the result that more capital and more labor are now employed in the industry than present demands require.

Hours.

The miners' demand for a six-hour day and a five-day week, which would have reduced the actual working time from 48 hours to 30, was not granted for the following reasons:

1. It would restrict output.
2. Shorter hours would attract more men to an industry that in seasons of low movement is already overmanned, and this in turn would probably result in further demands for the shortening of hours.
3. Shorter hours would not reduce the risks run by miners by reducing the time during which they are exposed to this risk, because the miners wish to adopt the shorter day or week not to limit the number of hours per year, but merely to distribute them more evenly.

The Minority Report.

MR. JOHN P. WHITE, the member of the commission representing the miners, while in accord with some of the findings of the majority report, could not subscribe to its solution of several of the major problems, and therefore submitted a minority report offering amendments.

Wages.

As regards wages, he agrees that the Washington agreement of October 6, 1919, shall continue, but subject to changes which he mentions.

He accepts the 24 per cent increase on pick and machine mining and the 20 per cent increase for all yardage, dead work, and room turning, not because these increases will result in the standard of living mentioned in the majority report, but because they will materially improve the living conditions of the men affected. He holds that day and monthly men should receive \$1.35 per day; trappers and boys, 75 cents a day, instead of \$1. and 53 cents a day awarded these classes of workers, respectively.

Objection is made to the method of wage determination used in the majority report, and Mr. White emphasizes two errors into which, in his opinion, the joint report has fallen in calculating and apportioning the wage increase. "In the first place," he points out, "the weighting chosen is upon the tonnage basis instead of upon the man basis; and in the second place the day workers, who have received the larger increase heretofore, are utilized to depress the average increase due to pick and machine miners, and then are not themselves awarded the increase as thus depressed."

He agrees with the joint report in its estimate of average increases received by the machine miner, the pick miner, and the day worker, respectively; but in view of the fact that a coal-mining machine can produce on the average 17,000 tons of coal per year,

while the production per employee is considerably less than 1,000 tons, and in view of the further fact that the ultimate compensation is intended to be such as will enable human beings to live in a creditable manner, he asserts that, "when it is sought to combine the increases of the machine and the pick miner, obviously the weighting chosen should be on the basis of the number of men actually employed at the two occupations and not upon the number of tons produced by the two methods."

Estimating the increase in wages on the man basis alone the minority report claims that the increase should be 31 per cent instead of 27 per cent, and that the increase in tonnage rates should be 27 cents per ton and not 24 cents.

Irregularity of Employment and the Shorter Working Day.

The minority and majority reports are in full accord as to the unsatisfactory effect of the irregularity of employment in mining operations and of the overexpansion of the industry upon working conditions and prices. It is pointed out in the minority report, however, that the majority report fails to make constructive suggestions to meet the problem of overdevelopment. Instead it implies that a regularization of the market will solve the problem of irregularity of employment, or to put it in another way, that "unemployment can be eliminated by being distributed."

This Mr. White believes would be impossible even though all the suggestions to this effect in the majority report were realized. Basing his statements upon figures given in weekly reports of the United States Geological Survey, he shows that the coal necessary for the normal market can be mined on an average of 30 hours of operation a week, that during the war the average operation was between 30 and 40 hours per week, the highest figure being under 42 hours, and that since the armistice the actual average has been under 30 hours per week. He concludes that since at present there appears to be no way of preventing overproduction, regulating the market as suggested by the majority report "would simply regularize the short working period required to satisfy the needs of the country," and that herein lies the fallacy of the continued eight-hour day.

The amount of unemployment due to labor shortage and strikes as given in the majority report is also questioned in the minority report. Official statistics are submitted to show that between 1910 and 1918 only 10.6 per cent of days lost in this industry resulted from strikes.

Figures are furthermore given to indicate the American miner's great liability to death by accident, which is ascribed to his greater productivity.

In regard to the whole question of the eight-hour day, Mr. White feels that the miners should be assured of two things:

"(1) That it shall be a real eight-hour day; that is, eight hours from the time the miner leaves the surface to the time he returns to the surface; (2) that punitive overtime shall be established as a means to its enforcement, and he recommends 'that the present working hours of mine employees continue in effect until March 31, 1921, and that, beginning April 1, 1921, the maximum hours for employees shall not exceed eight hours underground per day, and six days per week.'"

Miscellaneous Recommendations of the Minority Report.

The recommendation of the minority report as regards a tribunal to consider the important question of differentials in the central competitive field differs from that of the majority report in the number of members composing it and in the manner of their selection. The majority report recommends a body of eight men, one mine worker and one operator from each district in this field, while the minority report recommends a body of five men, two representatives of the miners' international officials, two of the officials of the Coal Operators' Association of the central competitive field, and a disinterested member to be chosen by the United States Secretary of Labor.

It is furthermore suggested by the minority report that since the hearings showed and the majority report admits that the public paid about 80 per cent of the 14 per cent increase granted by Mr. Garfield, in increased prices, the operators should be able to absorb the remainder of the present 27 per cent increase, or 13 per cent.

The relation of labor costs to total costs, profits, and prices in the bituminous coal-mining industry as well as the profits of bituminous coal companies were treated in too great detail in the minority report to be adequately discussed in this review.

Briefly, the minority report, like the majority report, finds the general belief that wage increases have been and will be necessarily a primary cause of advancing coal prices a mistaken one. The truth of this statement is substantiated by statistics from a recent report on the coal industry published by the Federal Trade Commission and by other official data. A study of the conditions in the Pennsylvania, the southwestern, and various other coal fields established the facts that:

1. Increased coal prices were not due to increased labor costs, but, on the contrary, were due largely to increased profits exacted by the operators; and
2. Increased wages to labor were more than offset and rendered less than negligible by the increased efficiency and increased productivity of labor.

Conclusion.¹

Upon the acceptance by the President of the majority report the scale committee of the bituminous operators and of mine workers was called in joint conference in New York City, March 29, 1920, to consider the terms of the award as regards increases in wages.

On motion of the mine workers' representatives the commission's award of 27 per cent increase was accepted, effective April 1, 1920. Locals in the competitive field were immediately notified of the decision and thus any cessation of mining operations was avoided.

A subcommittee based on the coal commission's report and composed of the international officers of the mine workers and two operators and two miners from each of the four States in the central competitive field was appointed to negotiate a new wage contract in line with the recommendations of the majority report.

Analysis of Labor Provisions of the New Transportation Act.

THE new railroad control act passed by Congress and signed by the President February 28, 1920, differs from previous railroad legislation principally in its inclusion of significant and extended provisions for the adjustment of industrial relations in the railroad service. Previous railroad legislation had proceeded along two distinct lines. There was first a separate body of legislation affecting the finances and operations of the carriers; and a second series of laws regulating the relations of employer and employee. In the first group of laws belong, for instance, the first interstate commerce act of 1887, the Elkins Act of 1903, the Hepburn amendment of 1906, the Carmack amendment of the same year, the Mann-Elkins amendment of 1910, the Panama Canal act of 1912, and the two general laws on combinations and trusts—the Sherman act of 1890, and the Clayton act of 1914. The second group of laws has comprised the employers' liability act, 1908, the safety appliance act of 1893 and subsequent years, the mediation laws—Erdman, 1898, and Newlands, 1913—and finally the Adamson 8-hour law, September 3-5, 1916.

Following this came the war legislation, the chief feature of which has been the recognition extended to labor in the determination of labor conditions and regulations and in the adjustment of industrial relations.

¹ Data taken from Washington (D. C.) Post, Mar. 30, 1920, p. 1.

Under the act of August 29, 1917, the President was authorized to take possession and assume control of the transportation systems of the country and to use them for such purposes as were connected with the prosecution of the war. The proclamation for the assumption of control was issued December 26, 1917. Subsequently, through the Federal control act, March 21, 1918, control by Executive order was replaced by control defined and limited under provisions of law. This Federal control act provided for Government operation of the railroads during the period of the war and not exceeding 21 months after the exchange of ratification of the treaty of peace.

As respects the control of industrial relations the new act incorporates some of the corresponding provisions of the Federal control act of March 21, 1918. Two kinds of boards are created to handle disputes between the carriers and their employees and subordinate officials: (a) Railroad boards of labor adjustment; (b) a railroad labor board. The railroad administration act provided for three labor adjustment boards. No statement is contained in the new law as to the number of such boards. This class of boards, whatever the number set up, is to take jurisdiction of any dispute upon application of the chief executive of any carrier or organization of employees or upon the written petition of not less than 100 unorganized employees, or upon motion of the adjustment board itself on the request of the labor board.

No rules are laid down defining the precise composition of these adjustment boards and their methods of procedure. These matters are left to the decision of the carriers and their employees.

The labor adjustment boards receive for hearing and decide disputes involving only grievances, rules of employment, and working conditions which have not been settled in conference between the carrier and its employees. The transportation act, it will be observed, makes no change in the methods of collective dealing now in practice among the carriers and their employees for the making of the labor contract and determining general conditions of employment. The act, however, does attempt to give voice to the unorganized employees of the railroad. Whether or not this method of approach in dealing with the employees proves effective remains to be seen in the course of administration of the act.

The principal agency created by the law for the final adjustment of disputes between the railroads and their employees is the Railroad Labor Board. This board is composed of nine members—three representing the employees and subordinate officials, three representing the carriers, and three representing the public. All three groups of members are appointed by the President with the consent of the Senate, the first two groups from not less than six nominees offered by the employees and the carriers, respectively. Failure of

either group to propose nominees gives the President power to appoint members directly to represent the group. The third group is appointed directly by the President.

The members of the board may not hold active membership in any organization of employees or be pecuniarily interested in any carrier. Honorary membership in any organization or rights to insurance or pension benefits in such organization are not required to be relinquished. The term of office is five years, and the salary \$10,000 per annum. Removal for cause rests with the President.

The labor board is authorized to hear and decide on appeal from the adjustment boards matters which those boards are empowered to consider. Wage or salary disputes which are not within the jurisdiction of the adjustment boards are also decided by the labor board if not settled by conference between the carriers and their employees. The labor board obtains jurisdiction of all disputes in the same manner as the adjustment boards, namely, upon its own motion or upon petition of the carrier or of the employees, whether organized or unorganized.

The board may suspend the operation of any decision between a carrier and its employees if there is involved an increase in wages or salaries such as to necessitate a substantial readjustment of rates.

Decisions of the labor board require the assent of at least five of the nine members, and in cases of decisions affecting wages or salaries at least one of the representatives of the public must concur in the decision.

The board has wide powers in compelling the attendance of witnesses, production of books, documents, and other information. While no penalty is provided for the violation of a decision of the labor board, yet the board is authorized to examine into the observance of its decisions and to make public the facts in any case.

In making its decisions affecting salaries and wages the board is directed to take into consideration as far as applicable certain relevant circumstances. These relevant factors are: (1) The scale of wages paid for similar kinds of work in other industries; (2) the relation between wages and the cost of living; (3) the hazards of the employment; (4) the training and skill required; (5) the degree of responsibility; (6) the character and regularity of the employment; and (7) inequalities of increases in wages or of treatment, the result of previous wage orders or adjustments.

The labor board becomes a continuing investigational agency respecting the relation between the carriers and their employees, particularly as to questions of wages, hours of work, conditions of employment, and the privileges, rights, and duties of carriers and employees. It is authorized to gather, classify, and publish from time to time information relating to such questions. It is required to publish annually its administrative decisions and regulations as well

as those of the Interstate Commerce Commission in so far as the latter affect industrial relations.

The act requires each carrier to continue until September 1, 1920, the scale of compensation to its employees and subordinate officials which have been fixed under the Federal railroad control act. After that period wages will become subject to new adjustments between the carriers and their employees.

The Interstate Commerce Commission plays no essential part, exercises no control, within the field of industrial relations under the act. Its sole function in this respect is that of drafting the rules for the selection of the members of the Railroad Labor Board.

The prohibition of strikes, contained in the Senate bill, was not incorporated in the law. Apparently the law contains no provision for compulsory delay in striking pending investigation of a dispute. The act merely cites it as "the duty of all carriers and their officers, employees, and agents to exert every reasonable effort and adopt every available means to avoid any interruption to the operation of any carrier growing out of any dispute between the carrier and the employees or subordinate officials thereof." It is a duty without penalty that is here stated. Whether or not the method of the injunction could be invoked to enforce that duty will be one for future determination by the courts.

Labor Provisions of the Transportation Act, 1920.

THE following are the labor provisions of the act:

TITLE III.—*Disputes Between Carriers and Their Employees and Subordinate Officials.*

SECTION 300. When used in this title—

(1) The term "carrier" includes any express company, sleeping car company, and any carrier by railroad, subject to the Interstate Commerce Act, except a street, interurban, or suburban electric railway not operating as a part of a general steam railroad system of transportation;

(2) The term "adjustment board" means any railroad board of labor adjustment established under section 302;

(3) The term "labor board" means the Railroad Labor Board;

(4) The term "commerce" means commerce among the several States or between any State, Territory, or the District of Columbia and any foreign nation, or between any Territory or the District of Columbia and any State, or between any Territory and any other Territory, or between any Territory and the District of Columbia, or within any Territory or the District of Columbia, or between points in the same State but through any other State or any Territory or the District of Columbia or any foreign nation; and

(5) The term "subordinate official" includes officials of carriers of such class or rank as the commission shall designate by regulation formulated and issued after such notice and hearing as the commission may prescribe, to the carriers, and employees and subordinate officials of carriers, and organizations thereof, directly to be affected by such regulations.

SEC. 301. It shall be the duty of all carriers and their officers, employees, and agents to exert every reasonable effort and adopt every available means to avoid any

interruption to the operation of any carrier growing out of any dispute between the carrier and the employees or subordinate officials thereof. All such disputes shall be considered and, if possible, decided in conference between representatives designated and authorized so to confer by the carriers, or the employees or subordinate officials thereof, directly interested in the dispute. If any dispute is not decided in such conference, it shall be referred by the parties thereto to the board which under the provisions of this title is authorized to hear and decide such dispute.

SEC. 302. Railroad boards of labor adjustment may be established by agreement between any carrier, group of carriers, or the carriers as a whole, and any employees or subordinate officials of carriers, or organization or group of organizations thereof.

SEC. 303. Each such adjustment board shall, (1) upon the application of the chief executive of any carrier or organization of employees or subordinate officials whose members are directly interested in the dispute, (2) upon the written petition signed by not less than 100 unorganized employees or subordinate officials directly interested in the dispute, (3) upon the adjustment board's own motion, or (4) upon the request of the labor board whenever such board is of the opinion that the dispute is likely substantially to interrupt commerce, receive for hearing, and as soon as practicable and with due diligence decide, any dispute involving only grievances, rules, or working conditions, not decided as provided in section 301, between the carrier and its employees or subordinate officials, who are, or any organization thereof which is, in accordance with the provisions of section 302, represented upon any such adjustment board.

SEC. 304. There is hereby established a board to be known as the "Railroad Labor Board" and to be composed of nine members as follows:

(1) Three members constituting the labor group, representing the employees and subordinate officials of the carriers, to be appointed by the President, by and with the advice and consent of the Senate, from not less than six nominees whose nominations shall be made and offered by such employees in such manner as the commission shall by regulation prescribe;

(2) Three members, constituting the management group, representing the carriers, to be appointed by the President, by and with the advice and consent of the Senate, from not less than six nominees whose nominations shall be made and offered by the carriers in such manner as the commission shall by regulation prescribe; and

(3) Three members, constituting the public group, representing the public, to be appointed directly by the President, by and with the advice and consent of the Senate.

Any vacancy on the labor board shall be filled in the same manner as the original appointment.

SEC. 305. If either the employees or the carriers fail to make nominations, and offer nominees in accordance with the regulations of the commission, as provided in paragraphs (1) and (2) of section 304 within thirty days after the passage of this act in case of any original appointment to the office of member of the labor board, or in case of a vacancy in any such office within fifteen days after such vacancy occurs, the President shall thereupon directly make the appointment, by and with the advice and consent of the Senate. In making any such appointment the President shall, as far as he deems it practicable, select an individual associated in interest with the carriers or employees thereof, whichever he is to represent.

SEC. 306. (a) Any member of the labor board, one from each group shall be appointed for a term of three years, one for two years, and one for one year. Their successors shall hold office for terms of five years, except that any member appointed to fill a vacancy shall be appointed only for the unexpired term of the member whom he succeeds. Each member shall receive from the United States an annual salary of \$10,000. A member may be removed by the President for neglect of duty or malfeasance in office, but for no other cause.

SEC. 307. (a) The labor board shall hear, and as soon as practicable and with due diligence decide, any dispute involving grievances, rules, or working conditions, in respect to which any adjustment board certifies to the labor board that in its opinion the adjustment board has failed or will fail to reach a decision within a reasonable time, or in respect to which the labor board determines that any adjustment board has so failed or is not using due diligence in its consideration thereof. In case the appropriate adjustment board is not organized under the provisions of section 302, the labor board. (1) upon the application of the chief executive of any carrier or organization of employees or subordinate officials whose members are directly interested in the dispute, (2) upon a written petition signed by not less than 100 unorganized employees or subordinate officials directly interested in the dispute, or (3) upon the labor board's own motion if it is of the opinion that the dispute is likely substantially to interrupt commerce, shall receive for hearing, and as soon as practicable and with due diligence decide, any dispute involving grievances, rules, or working conditions which is not decided as provided in section 301 and which such adjustment board would be required to receive for hearing and decision under the provisions of section 303.

(b) The labor board, (1) upon the application of the chief executive of any carrier or organization of employees or subordinate officials whose members are directly interested in the dispute, (2) upon a written petition signed by not less than 100 unorganized employees or subordinate officials directly interested in the dispute, or (3) upon the labor board's own motion if it is of the opinion that the dispute is likely substantially to interrupt commerce, shall receive for hearing, and as soon as practicable and with due diligence decide, all disputes with respect to the wages or salaries of employees or subordinate officials of carriers, not decided as provided in section 301. The labor board may upon its own motion within ten days after the decision, in accordance with the provisions of section 301, of any dispute with respect to wages or salaries of employees or subordinate officials of carriers, suspend the operation of such decision if the labor board is of the opinion that the decision involves such an increase in wages or salaries as will be likely to necessitate a substantial readjustment of the rates of any carrier. The labor board shall hear any decision so suspended and as soon as practicable and with due diligence decide to affirm or modify such suspended decision.

(c) A decision by the labor board under the provisions of paragraphs (a) or (b) of this section shall require the concurrence therein of at least 5 of the 9 members of the labor board: *Provided*, That in case of any decision under paragraph (b) at least one of the representatives of the public shall concur in such decision. All decisions of the labor board shall be entered upon the records of the board, and copies thereof, together with such statement of facts bearing thereon as the board may deem proper, shall be immediately communicated to the parties to the dispute, the President, each adjustment board, and the commission, and shall be given further publicity in such manner as the labor board may determine.

(d) All the decisions of the labor board in respect to wages or salaries and of the labor board or an adjustment board in respect to working conditions of employees or subordinate officials of carriers shall establish rates of wages and salaries and standards of working conditions which in the opinion of the board are just and reasonable. In determining the justness and reasonableness of such wages and salaries or working conditions the board shall, so far as applicable, take into consideration among other relevant circumstances:

- (1) The scales of wages paid for similar kinds of work in other industries;
- (2) The relation between wages and the cost of living;
- (3) The hazards of the employment;
- (4) The training and skill required;
- (5) The degree of responsibility;

(6) The character and regularity of the employment; and

(7) Inequalities of increases in wages or of treatment, the result of previous wage orders or adjustments.

SEC. 308. The labor board—

(1) Shall elect a chairman by majority vote of its members;

(2) Shall maintain central offices in Chicago, Illinois, but the labor board may, whenever it deems it necessary, meet at such other place as it may determine;

(3) Shall investigate and study the relations between carriers and their employees, particularly questions relating to wages, hours of labor, and other conditions of employment and the respective privileges, rights, and duties of carriers and employees, and shall gather, compile, classify, digest, and publish from time to time data and information relating to such questions, to the end that the labor board may be properly equipped to perform its duties under this title and that the members of the adjustment boards and the public may be properly informed;

(4) May make regulations necessary for the efficient execution of the functions vested in it by this title; and

(5) Shall at least annually collect and publish the decisions and regulations of the labor board and the adjustment boards and all court and administrative decisions and regulations of the commission in respect to this title, together with a cumulative index-digest thereof.

SEC. 309. Any party to any dispute to be considered by an adjustment board or by the labor board shall be entitled to a hearing either in person or by counsel.

SEC. 310. (a) For the efficient administration of the functions vested in the labor board by this title any member thereof may require by subpoena issued and signed by himself the attendance of any witness and the production of any book, paper, document, or other evidence from any place in the United States at any designated place of hearing, and the taking of a deposition before any designated person having power to administer oaths. In the case of a deposition the testimony shall be reduced to writing by the person taking the deposition or under his direction and shall then be subscribed to by the deponent. Any member of the labor board may administer oaths and examine any witness. Any witness summoned before the board and any witness whose deposition is taken shall be paid the same fees and mileage as are paid witnesses in the courts of the United States.

(b) In case of failure to comply with any subpoena or in case of the contumacy of any witness appearing before the labor board the board may invoke the aid of any United States district court. Such court may thereupon order the witness to comply with the requirements of such subpoena, or to give evidence touching the matter in question, as the case may be. Any failure to obey such order may be punished by such court as a contempt thereof.

(c) No person shall be excused from so attending and testifying or deposing, nor from so producing any book, paper, document, or other evidence on the ground that the testimony or evidence, documentary or otherwise, required of him may tend to incriminate him or subject him to a penalty or forfeiture; but no natural person shall be prosecuted or subjected to any penalty or forfeiture for or on account of any transaction, matter, or thing as to which, in obedience to a subpoena and under oath, he may so testify or produce evidence, documentary or otherwise. But no person shall be exempt from prosecution and punishment for perjury committed in so testifying.

SEC. 311. (a) When necessary to the efficient administration of the functions vested in the labor board by this title, any member, officer, employee, or agent thereof, duly authorized in writing by the board, shall at all reasonable times, for the purpose of examination, have access to and the right to copy any book, account, record, paper, or correspondence relating to any matter which the board is authorized to consider or investigate. Any person who upon demand refuses any duly authorized member,

officer, employee, or agent of the labor board such right of access or copying, or hinders, obstructs, or resists him in the exercise of such right shall, upon conviction thereof, be liable to a penalty of \$500 for each such offense. Each day during any part of which such offense continues shall constitute a separate offense. Such penalty shall be recoverable in a civil suit brought in the name of the United States and shall be covered into the Treasury of the United States as miscellaneous receipts.

(b) Every officer or employee of the United States, whenever requested by any member of the labor board or an adjustment board duly authorized by the board for the purpose, shall supply to such board any data or information pertaining to the administration of the functions vested in it by this title which may be contained in the records of his office.

(c) The President is authorized to transfer to the labor board any books, papers, or documents pertaining to the administration of the functions vested in the board by this title which are in the possession of any agency or railway board of adjustment in connection therewith established for executing the powers granted the President under the Federal control act and which are no longer necessary to the administration of the affairs of such agency.

SEC. 312. Prior to September 1, 1920, each carrier shall pay to each employee or subordinate official thereof wages or salary at a rate not less than that fixed by the decision of any agency, or railway board of adjustment in connection therewith, established for executing the powers granted the President under the Federal control act, in effect in respect to such employee or subordinate official immediately preceding 12.01 a. m., March 1, 1920. Any carrier acting in violation of any provision of this section shall, upon conviction thereof, be liable to a penalty of \$100 for each such offense. Each such action with respect to any such employee or subordinate official and each day or portion thereof during which the offense continues shall constitute a separate offense. Such penalty shall be recoverable in a civil suit brought in the name of the United States, and shall be covered into the Treasury of the United States as miscellaneous receipts.

SEC. 313. The labor board, in case it has reason to believe that any decision of the labor board, or of an adjustment board, is violated by any carrier, or employee or subordinate official, or organization thereof, may upon its own motion after due notice and hearing to all persons directly interested in such violation, determine whether in its opinion such violation has occurred and make public its decision in such manner as it may determine.

SEC. 314. The labor board may (1) appoint a secretary, who shall receive from the United States an annual salary of \$5,000; and (2) subject to the provisions of the civil-service laws, appoint and remove such officers, employees, and agents; and make such expenditures for rent, printing, telegrams, telephone, law books, books of reference, periodicals, furniture, stationery, office equipment, and other supplies and expenses, including salaries, traveling expenses of its members, secretary, officers, employees, and agents, and witness fees as are necessary for the efficient execution of the functions vested in the board by this title and as may be provided for by Congress from time to time. All of the expenditures of the labor board shall be allowed and paid upon the presentation of itemized vouchers therefor approved by the chairman of the labor board.

SEC. 315. There is hereby appropriated for the fiscal year ending June 30, 1920, out of any money in the Treasury not otherwise appropriated, the sum of \$50,000, or so much thereof as may be necessary, to be expended by the labor board, for defraying the expenses of the maintenance and establishment of the board, including the payment of salaries as provided in this title.

SEC. 316. The powers and duties of the board of mediation and conciliation created by the act approved July 15, 1913, shall not extend to any dispute which may be received for hearing and decision by any adjustment board or the labor board.

Annual Report of Division of Labor, United States Railroad Administration, for 1919.

A RECOMMENDATION for the continuance, even after the end of Government operation of railroads, of the boards of adjustment¹ set up by the Railroad Administration to render decisions on controversies arising out of the application of wage orders and on other disputes between railroad officials and employees, is contained in the annual report for the year 1919 of the director of the Division of Labor of the Railroad Administration.

The report calls attention to the fact that railway boards of adjustment have no jurisdiction over the recommendation, issuance, and interpretation of wage orders, their duties being confined to decisions on controversies arising out of the application of wage orders and to decisions on all other disputes between the officials and employees working under agreements. The director of the Division of Labor regards the work of these boards as having demonstrated not only the advisability of the creation of such boards, but the necessity of their continuance either under Federal control of railroads or otherwise. The fact that the boards are "bipartisan," without "umpire" or "neutral member," and that all of the members are experts on railroad agreement matters, it is believed has led both officials and employees to have confidence not only in the fairness of decisions reached, but as to the technical ability of the members of the boards to pass intelligently upon all controversies submitted for decision.

The report outlines labor conditions on railroads prior to Government control and the railroad labor situation when Government control began, as follows:

One of the principal purposes of the creation of the Division of Labor was to provide means whereby the controversies that constantly arise between railroad officials and employees would be promptly and equitably adjusted. An inability to adjust these controversies under past practices resulted in strikes, threatened strikes, or a constant unrest among employees to the extent that the efficiency of the service had greatly diminished at the time that the roads were taken over under Federal control.

It is but fair to say that neither the operating officials nor the employees were entirely to blame for so undesirable a situation. While on some roads there had never been a liberal policy toward employees of certain classes, a study of past relations will reveal the fact that not so many years ago the labor policy of a railroad was developed entirely by the operating officers. At that time committees of employees, with the knowledge that their immediate operating officers had the authority to grant wage increases, revise wage agreements, and adjust personal grievances, entered into negotiations with their respective officials with an open mind, and with the belief that if evidence and argument could be presented that would prove their contentions, the operating officials of the road would at least grant some relief from the conditions of employment against which complaint was made.

¹ Accounts of the creation of these boards of adjustment were published in the MONTHLY LABOR REVIEW for May, 1918 (pp. 180-182), July, 1918 (p. 132), and March, 1919 (p. 162).

In those days wage increases were granted from time to time, wage agreements were revised so as to include rules more favorable to employees, and personal grievances arising out of the administration of discipline were disposed of usually without a strike or a threat of a strike.

It is alleged by employees that with a concentration of financial control of the railroads, either by groups or districts, operating officials lost all authority over the labor policies upon the respective railroads with the result that it was alleged that the operating officials of a railroad were no longer permitted to exercise their own judgment in disposing of these matters.

With the creation of "general managers' associations," covering a comparatively large territory, came "district movements" by employees for the adjustment of wage matters.

During the two or three years antedating Federal control of the railroads an alarming situation was created in that the employees' organizations, as a whole and through federations, found themselves confronted with similar federations on the part of the railroads, the roads being represented by conference committees and the conference committees being subordinate to "advisory committees." It was alleged by employees that these conference committees of all of the principal railroads in a district were not permitted to grant the demands of employees, or even to make favorable compromises, without the consent of the advisory committee. The advisory committee it is alleged was the agent of the great banking institutions that controlled the financial policy of all the railroads.

Arbitrations have been resorted to in the later years in these district movements, with the result that employees reached the conclusion that an arbitration award depended entirely upon the frame of mind of the neutral arbitrator. Persons selected to perform this function were liberal in their awards, in accordance with the liberality of their minds when appointed upon such arbitration boards.

There seems to have been a public opinion that any man, even indirectly connected with labor, would be unqualified to act as a neutral arbitrator, with the result that most estimable gentlemen who had never had any connection with, and who had little knowledge of, labor conditions, were called upon to act as umpires in these great contests. It was alleged by the employees that usually these arbitrators, having no technical knowledge of wage schedules, often made awards that were difficult of interpretation, if they did not, in fact, bring about conditions the very opposite to that intended by the neutral arbitrator. It also became apparent that in the application of the arbitration award the officials of a railroad were the sole administrators thereof, with the result that after employees had been led to believe that an arbitration award brought them much relief it was applied in a manner that "took away from them more than had been given them."

Later, provisions were made for submitting controversies over the application of an arbitration award back to the arbitration board or to some other umpire, but this resulted in the continuation of controversies over a period of two or three years.

It may be truthfully said that at the time the railroads passed under Federal control, because of these vexatious contentions, the morale of railway employees had sunk to a low degree. In many instances there was an entire absence of esprit de corps, so necessary for efficient operation.

It was with the knowledge of this alarming situation, and with a determination to restore harmonious relations between employees and the railroads and thereby increase the efficiency of the railroads, that the Division of Labor of the Railroad Administration was created.

Unauthorized Strikes in 1919.

DISCUSSING the unauthorized strikes which occurred on railroads during 1919, the report states:

During the year 1919 a considerable number of minor strikes occurred, practically all of which were not authorized by the organization of which the employees were members. A major proportion of these strikes was adjusted through the initiative of the Division of Labor. In some instances the representatives of this division used their good offices to bring about a final adjustment, but in other instances activities of the representatives of the division ceased when the strikers returned to work and the original controversy was referred by mutual consent back to the officials and employees of the railroads to adjust. * * *

It is believed that a vast majority of these unauthorized strikes arose out of the fact that the employees at these local points did not fully understand that a proper tribunal had been created by the Railroad Administration to which all controversies should be referred and that equitable decisions would be reached by such tribunal.

An interesting point in the report of Board of Adjustment No. 1, included in the report under review, is the statement that the average cost per decision during the last six months of 1919 was \$10.74, representing a reduction in cost per decision of \$10.03, or 48.29 per cent, as compared with the cost per decision during 1918. Board of Adjustment No. 2 reported that an average of four and one-half controversies had been passed upon at each meeting of the board. As of December 31, 1919, Board of Adjustment No. 1 reported that it had 160 cases not disposed of, 33 of them having been held waiting for further data; Board of Adjustment No. 2 reported that on the same day it had 86 cases not disposed of; and Board of Adjustment No. 3 reported that it had 31 cases not disposed of.

Conference of Australian Employers' Federations on Industrial Relationships.¹

A CONFERENCE of Australian employers' federations held in Melbourne during the latter part of 1919 resulted in the publication of a report setting forth the opinions of employers regarding the best methods of improving the relations between them and their workers. After commenting on the large number of strikes which took place during the years 1913 to 1918, the report proceeds to discuss the causes of industrial unrest, in the following words:

Limitation of output has undoubtedly had a considerable influence on the cost of living, but the main cause of industrial unrest would seem to be based on the assiduous promulgation of the belief that the workers should receive a larger share of the profits of the industry, and thus add to the amount received in the way of wages. Broadly speaking, it is the opinion of this conference that no mere changes of system can bring any substantial benefit to the employees. Nationalization, profit sharing, copart-

¹ Data taken from New Zealand Employers' Federation Industrial Bulletin, Jan. 6, 1920, pp. 4-6. Wellington.

nership, a voice in the management—all these things are mere variations in detail. The workers as a body would gain no substantial monetary advantages from the indiscriminate adoption of any or all of them. On the contrary, they might conceivably be worse off by an elimination of private enterprise, and the consequent lack of incentive to efficient and economical production.

The conference went on record definitely in favor of the promotion of harmony in the industrial life of the community by the adoption of the following recommendations:

1. The continuance of the present system of arbitration tribunals for fixing the living wage, and for settling the standard wage and working conditions in each industry.
2. Parliament to decide the number of hours to constitute a week's work.
3. The adoption of the Whitley scheme in a modified form.
4. The introduction of profit-sharing where practicable.
5. The adoption of the system of payment by results.
6. [Provision against] unemployment by general commonwealth taxation.
7. Encouragement and assistance to employees in the building or purchasing of their homes by State or Federal Government.
8. Commonwealth legal endowment for children under 14 years of age, where wages do not exceed a stipulated amount.

Whitley Scheme, Profit Sharing, Payment by Results.

CONCERNING the Whitley scheme the report makes the following general observation:

It is obvious that the adoption of the Whitley scheme in its entirety would render unnecessary the continuance of our present industrial tribunals established under State and Federal industrial laws, except as possible courts of appeal. This, we believe, would not be acceptable to the majority of trades-unionists and employers as a desirable or satisfactory change. That portion of the Whitley scheme which recommends the establishment of works committees and trade councils is, in our opinion, worthy of the most favorable consideration. Many questions arise in workshops and factories from day to day which could be satisfactorily dealt with and adjusted by such committees acting in conjunction and consultation with the management. It needs no stretch of imagination to discern enormous possibilities of benefit and advantage to employees and employers as a result of closer acquaintance and knowledge by both parties of what is possible and what is practicable in the conduct of business enterprises.

The following general statements in regard to profit sharing were made by the conference:

1. In most businesses after providing for a moderate return on capital and allowing reasonably for development there would be little left for division among employees.
2. Many businesses (especially manufacturing concerns) are carried on and developed so largely on borrowed capital, that if the book profits were paid away each year, liabilities could never be reduced and extensions would be impossible.
3. Profits shown in balance sheets are book profits, and are seldom represented by cash balances. In many instances the payment of a dividend representing mere interest on shareholders' capital is only possible by the confidence of the firm's bankers in the soundness and stability of the business.
4. In bad years the employees could not be expected to help make up the deficiency, but the absence of any profit or bonus would lead to discontent and dissatisfaction.
5. Any system adopted with the object of rewarding workers for increased output must provide payment for extra work done in bad years as well as in good years.

6. In industries where employment varies, change or irregularity of employment would deprive many workers of any participation in a division of profits.

7. The undue restriction of the profits and rewards of industrial undertakings would tend to destroy enterprise and react prejudicially upon the employees.

8. Profit sharing would not secure to the employees generally any substantial financial benefit.

9. Nevertheless, in any business or industry in which a system of profit sharing can be applied, which would be acceptable to employees, and insure substantial benefit, this conference recommends that it should be tried.

The principle of payment by results is recommended, with the following as the basis of remuneration:

1. The standard minimum wage in all industries shall be fixed by independent tribunals. The standard wage to be regarded as a fixed minimum and not to be affected by any agreement entered into on the basis of extra pay for extra output.

2. A representative of the employees (or a shop committee) to agree with the management as to the amount of work which shall be taken to represent the value of the standard wage.

3. Any individual employee who exceeds the minimum output shall be paid the full labor or time value of the work so performed.

4. Where desirable, or necessary, the output of a group of employees may be treated in a similar manner, the excess of hours or units of production to be computed and paid for weekly or monthly as may be arranged.

5. For the purpose of computing the time value of varied work, the employer to provide skilled accountancy assistance where necessary, and to pay the employees' appointed representative in each department for the time occupied in conferring with the management as to computation of time values.

6. Piecework to be introduced in industries or industrial sections, where the character of the work performed allows of fixed piecework rates being established.

The conference is of opinion that it would be possible to apply this system to a great many manufacturing establishments and other classes of business, with benefit to employees and employers, and with the very desirably additional result that the workers would receive substantial increased remuneration without any increase in the cost of production and without increasing the consequent selling price to the consumer.

In conclusion, the report states:

The conference recognizes that the assistance and good will of the trades-unions would be necessary for the successful adoption in any industry of the suggestions or recommendations contained in the report. It would involve the recognition by the unions of the introduction of piecework, or payment by results, with no limitation of output. It would also be necessary that employees in an industrial establishment shall be allowed to enter into agreements with the management in settling many local conditions, provided there was no infringement of an industrial award governing the industry in regard to wages, hours, and working conditions. The conference feels that it is necessary that concerted effort should be made to impress the lesson that the further development of industrial relations, based upon the idea of class war, can not but bring serious disaster to the whole community. Industry is a living organism and is undergoing a process of continuous development and growth. Change must, however, be gradual and on tested lines. Theories must be proved before they can be adopted, and the risk of personal loss is one of the great stabilizing influences. It must be apparent, however, that if a genuine effort is to be made toward a solution of an amelioration of the present disturbed industrial position it can be brought to a successful issue only by free and full discussion and a generous recognition by employers and employees that justice and fair dealing is the only foundation on which industrial peace can be established.

Labor Conditions on French Railways and Tramways.¹

OF ALL the problems confronting the Government in France that of transportation is apparently the most pressing. The demands of devastated areas call for extraordinary service. The physical condition of the roads both as to "ways" and equipment is far below normal. Facilities for repair and maintenance are insufficient. The personnel has been depleted. Skilled machinists and engineers are needed in construction and operating departments. The Minister of Public Works in circulars and reports recognizes the fidelity and loyalty shown by the employees during the difficult period of the war, and strongly recommends measures for their relief and compensation for extraordinary and continued sacrifices.

Recent orders issued by him also embody the principle of employees' representation. In connection with the management of the system consisting of the six State-owned roads, a committee on operation has been created consisting of an official appointed by the roads as president, the general manager of each of the six roads, three representatives of commerce, industry, and agriculture, appointed by the permanent bureau of the consultative committee on railroads from the members of the committee, and three employee representatives chosen by the Minister of Public Works. A similar committee has also been provided for, to take charge of all matters relative to materials and motive power.

These committees are authorized to summon the superintendents of the various departments of the service to attend their sessions in an advisory capacity. They are required to meet periodically, and the president or competent Government official may call them in special session. The committee on operation must meet at least once a week.

The instructions of the minister further state that for the purpose of restoring former efficiency all officials of the various roads, employees, and laborers, committees, etc., are to be consulted and requested to make suggestions looking to the improved physical condition of the roads, the advisability of lowering the standard required for certain employment in skilled occupations without impairing safety in operation, the granting of bonuses, the increasing of wages as an incentive to increased production and recruitment, and adoption of measures to maintain the stability of shop employees. Other recommendations relate to reemployment of service men; adoption of an increased wage scale and a schedule of better working regulations; introduction of the shift system in the operating depart-

¹ Journal Officiel de la République Française, Sept. 19, Oct. 21, Oct. 25, Nov. 4, and Nov. 9, 1919. Paris.

ment, and a modification of the retirement law. Maximum effort is demanded in all branches of railroad service and in the devastated districts working hours and conditions must to some extent be disregarded. Steps must be taken to restore the zeal and confidence of employees, and to recruit and instruct skilled mechanics.

The following provisions appear in these recent orders of the Minister of Public Works:

Rest periods.—Eight hours of actual work daily are to be the standard. The number of hours worked between rest days shall not exceed the number of days intervening multiplied by 8. Not more than 9 hours of actual work in 24 may be required except for special reasons. Under no conditions shall the hours exceed 10, limited to 6 days a month. The spread of the daily hours shall not exceed 12 per day, except that it may be twice increased to 14 between two consecutive rest days. It shall not average more than 10 hours per day between two consecutive rest periods. Employees working overtime must be granted a 30-minute lunch period after 6 hours of actual labor. There must be one rest period of 38 hours at home after 6 days of consecutive work. This period shall include 2 consecutive nights beginning not later than 10 p. m. on the first, and ending not earlier than 6 a. m. on the second night.

Shift systems.—In case work is done by a three-shift system of 8 hours each daily, rests shall be arranged to alternate with the various shifts, as follows: Each shift shall work 8 morning shifts followed by 32 hours off duty, then 8 night shifts followed by 56 hours off duty, and finally, 5 evening shifts, followed by a 32-hour rest interval.

When two shifts, A and B, only work, each employee shall work in shift A 8 hours daily for 8 consecutive days, followed by a rest, then in shift B 6 consecutive days, followed by a rest. The average duration of these off-duty periods shall be equal to the full day's rest plus 24 hours. An additional rest period of 24 hours every second month is arranged for by turns for the two shifts. During the off-duty periods the employee is subject to no call for service, and may be away from home.

Hours of work defined.—Actual working time is defined as including the entire time an employee is required to be on his locomotive or to remain near it, or is called upon to do any work in stations, depots, or shops.

Special regulations for the two classes of reserve employees include the provision that the spread of hours of reserve duty shall not exceed 18 hours daily, or 16 hours if actual work is included in this period.

Exception to the regular hours of work is permissible under certain conditions—danger, for national defense, urgent work, etc.

Overtime work.—Extra pay is provided for overtime work not compensated for in the next following rest period.

Employees' representation.—An order becoming effective December 10, 1919, provides for employees' representation on each of several of the State-owned roads, by the creation of central and local committees composed of engineers and firemen, and of central and local committees made up of trainmen. The personnel of the management of the railway systems and that of the employees is equally represented on these committees and the local committees elect the members of the central committees. Each committee is an advisory body on all questions relative to regulations adopted for the work of the personnel which it represents. The local committees are elected directly by the employees concerned.

Proposed changes in working regulations of engineers and firemen, and trainmen, respectively, are subject to the approval of the central committee and the administration. They are valid for three months unless exceptional circumstances seem to justify modifications, when either the road or the committee may demand an earlier revision.

Deviations from regular schedule.—When it becomes necessary to deviate from regular schedules, such deviations shall be reported to the competent officials not later than the tenth of the month following. More than five important deviations in any month call for a modification of schedules.

Tramways.²

General conditions.—During the last two years the Minister of Public Works has issued numerous decrees authorizing increased passenger and freight rates on tramways and local steam roads. In most, if not all, cases they were granted in consequence of agreements previously made between individual roads and municipal authorities, providing for increased wages, bonuses, improved working conditions, and other changes favorable to the employees. The increases in wages vary from 700 to 1,080 francs (\$135.10 to \$208.44, par) per year for the higher paid employees and proportional increases for all other classes. Bonuses for cost of living and family allowances for married employees are frequent items. These also vary, but the usual allowance for family charge is from 50 to 150 francs (\$9.65 to \$28.95, par) per year where there is but one child under 16 years of age, and from 100 to 300 francs (\$19.30 to \$57.90, par) for each additional child under that age. Not infrequently these increases are retroactive for some months.

Character of increases.—Illustrative of the character of increases is the agreement entered into August 18, 1919, between the Department of the Nord and the tramway companies of Douai. The pro-

² Journal Officiel de la République Française, Sept. 1 to Dec. 31, 1919.

posed increases in wage scales and allowances, and the period during which they will be paid, are made obligatory by the decree. The following table indicates their character and extent.³

PRESENT YEARLY WAGES AND AMOUNT OF INCREASE GRANTED ADULT MALE AND MINOR EMPLOYEES OF FRENCH TRAMWAYS.

[One franc at par=19.3 cents.]

Adult males.		Minors of both sexes, full-time workers.	
Present yearly wages.	Increase.	Present yearly wages.	Increase.
Not more than 3,600 francs.....	1,080 francs ¹	Not more than 1,200 francs.....	50 per cent.
From 4,800 to 6,000 francs.....	990 francs.....	From 1,200 to 1,800 francs.....	25 per cent.
From 6,001 to 7,000 francs.....	700 francs.....	From 1,800 to 3,600 francs.....	15 per cent.
From 7,001 to 8,000 francs.....	500 francs.....		
From 8,001 to 9,000 francs.....	300 francs.....		

¹ Reduced by 15 francs for each 100 francs increase in wages up to 4,800 francs.

Unless the husband or father of an adult female worker is in receipt of an increase or a pension paid by the company her yearly wages will be increased 1,080 francs (\$208.44 par). If the father or husband is in receipt of either, the increase will be 720 francs (\$138.96, par). For woman part-time workers, an increase of 540 francs (\$104.22, par) will be granted in case no pension or increase as above mentioned is paid, or 240 francs (\$46.32, par) if such pension or increase is paid.

Minors of both sexes who are part-time employees will receive an increase equal to that paid minors who are full-time workers, but no minimum wage has been established.

Yearly allowances for family charges are 150 francs (\$28.95, par) for each of the first two children, and 300 francs (\$57.90, par) for each additional child under 16 years of age. These allowances are reduced by 150 francs (\$28.95, par) in case of employees whose wages range from 8,100 francs to 9,000 francs (\$1,563.30 to \$1,737, par) and by 300 francs (\$57.90, par) for those receiving between 9,000 and 10,000 francs (\$1,737 and \$1,930, par) with corresponding decreases as wages exceed 10,000 francs.

An increase in transportation rates equal to 50 per cent was authorized for the period in which this agreement is in force.

Guaranteed income.—In some instances, as for example, the agreement of the city of Nancy and the General French Tramway Company, of October 6, 1919, the municipal authorities "recognize that it is imperative for the city to assist the company in supporting the new charges"⁴ imposed by new social laws, and provide that a special account be kept of all wage increases, allowances, etc., as stipulated in the agreement, and paid by the company from August 1, 1919, as well as the additional expense incurred in the em-

³ Journal Officiel de la République Française, Sept. 19, 1919.

⁴ Idem, Nov. 4, 1919.

ployment of new employees made necessary by the eight-hour law, including the amount paid by the company into the retirement fund. If expenses exceed receipts the city must cover the deficiency, not in excess of the amount of the special account. Quarterly statements are required. The total advances made in consequence of these expenses for the year shall in no case be greater than the difference between expenses and receipts. At the end of the year the company reimburses the city for any sums that may have been advanced in previous quarters in excess of the difference.

The average hours of daily labor for the year shall not exceed eight. Permanent employees in the operating department are entitled to 10 days' annual leave as compensation for extra hours. Wages are determined by length of service, with advancement after two years in each of the respective classes. Women may be generally employed, but may perform the duties of motorman in exceptional cases only. Trainmen having been two years in the service of the company are eligible as conductor apprentices. Conductors are chosen from permanent employees who have served a probationary period of one year.

Compensation for increased cost of living is fixed for all classes engaged in train movement at 2 francs (38.6 cents, par) per day. Permanent employees are paid this bonus for the regular weekly rest day also, others only for actual days worked. The cost of living bonus in addition to wages is paid to married persons only.

Eight hours of actual labor per day constitute a day's work in the shop. Wages vary with the class of work, occupational skill, and length of service, a minimum of 1.5 francs (29 cents, par) per hour being paid for unskilled labor, bonuses included.

Persons whose physical condition precludes the performance of a full day's work may be paid a rate lower than the regular wages, but the maximum proportion of such workmen is fixed at one-eighth of all employees, and the reduction from regular wages must not be greater than 25 per cent. During the period of military training regular employees are paid at one-half the usual rate. Sickness benefits are paid at the rate of two-thirds regular wages for the first 15 days of sickness, 6 francs per day thereafter up to the end of three months, and 4 francs per day for the next three months. During the life of the agreement the company assumes the entire charge of medical, pharmaceutical, and other expenses and compensation in cases of sickness.

Discharges for other than grave fault and without eight days' advance notice, are prohibited, and no one shall quit employment without giving similar notice of his intention. A discharged employee may demand a hearing before a board in which the employees are represented.

PRICES AND COST OF LIVING.

Retail Prices of Food in the United States.

THE following tables are based on figures which have been received by the Bureau of Labor Statistics from retail dealers through monthly reports of actual selling prices.¹

Table 1 shows for the United States retail prices of food on January 15 and February 15, 1920, and on February 15, 1919, as well as the percentage changes in the month and in the year. For example, the price of sugar in February, 1919, was 10.7 cents; in January, 1920, 17.8 cents; and in February, 1920, 18.8 cents. These figures show an increase of 6 per cent in the month and an increase of 76 per cent in the year. The cost of 22 weighted articles combined² increased 16 per cent in the year, but decreased six-tenths of 1 per cent in the month.

¹ In addition to retail prices of food, the bureau secures prices of coal, gas, and dry goods from each of 51 cities, and publishes these prices as follows: Coal, in the March and September issues of the MONTHLY LABOR REVIEW; gas, in the June issue; dry goods, in the April, July, October, and December issues.

² Following are the 22 articles, weighted according to the consumption of the average family: Sirloin steak, round steak, rib roast, chuck roast, plate beef, pork chops, bacon, ham, lard, hens, flour, corn meal, eggs, butter, milk, bread, potatoes, sugar, cheese, rice, coffee, tea. These include all articles for which prices have been secured each month since 1913, with the exception of lamb, for which the Bureau has no consumption figures.

Table 2 shows for the United States average retail prices of specified food articles on February 15 of each year, 1913 to 1920, together with the percentage change in February of each year compared with February, 1913. For example, as compared with the price in February, 1913, potatoes had increased 19 per cent in 1914, but in 1915 were 6 per cent cheaper than in 1913. By 1916 potatoes had increased 56 per cent; by 1917, 219 per cent, or cost over three times as much as in 1913. In 1918, the price was double that of 1913. In February, 1919, the price was 94 per cent higher than in February, 1913, and in February, 1920, the price had increased 275 per cent, or was 3½ times as much as it was in February, 1913.

Relative Retail Prices of 22 Articles of Food.

IN TABLE 3, the average monthly and yearly prices of 22 food articles¹¹ are shown as relative prices or percentages of the average prices for the year 1913. These relatives are computed by dividing the average price of each commodity for each month and each year by the average price of that commodity for 1913. Relative prices must be used with caution. For example, the relative price of pork chops in November, 1919, was 200, which means that the money price was 200 per cent of the money price in 1913, or, in other words, the price doubled. The relative price of pork chops in December was 181, showing a drop of 19 points from 200, which is a decrease of only 9.5 per cent.

In the last column of this table are given index numbers¹² showing the changes by months and years in the retail cost of the 22 food articles weighted according to the importance of each article in the consumption of the average family. Prices are obtained each month for 43 food articles, but only 22 of these are included in the retail food price index because the amounts consumed by the average family have been obtained as yet for only these 22 food articles. These articles comprise about two-thirds of the entire food budget of the average family and reflect with great accuracy changes in the cost of the food budget. The figure representing the cost of these 22 food articles was 201 in January, 1920, and 200 in February, 1920. This shows that as compared with 1913 the cost of these food articles was in February, 1920, double what it was in 1913. The figures also show that from January to February of this year there was a decrease of less than 1 per cent. In 1919, the figures for January was 185 and for February was 172, which shows a decrease of 7 per cent in February of last year.

¹¹ For list of articles, see note 2, p. 68.

¹² For a discussion of the method used in the computation of these index figures, see MONTHLY LABOR REVIEW for March, 1920, pp. 34 and 35.

TREND IN RETAIL PRICES OF 22 FOOD ARTICLES, COMBINED, FOR THE UNITED STATES, BY MONTHS, JANUARY, 1913, TO FEBRUARY, 1920.

[Average for 1913=100.]

The curve shown in the chart on page 75 pictures more readily to the eye the changes in the cost of the family market basket and the trend in the cost of the food budget than do the index numbers given in the table. The chart has been drawn on the logarithmic scale ¹⁴ because the percentages of increase and decrease are more accurately shown than on the arithmetic scale.

Comparison of Retail Food Costs in 50 Cities.

TABLE 4 shows for 39 cities the percentage of increase or decrease in the retail cost of 22 food articles in February, 1920, compared with the average cost in the year 1913, in February 1919, and in January, 1920. For 11 other cities comparisons are given for the one-year and one-month periods. These cities have been scheduled by the Bureau at different dates since 1913. These percentage changes are based on actual retail prices secured each month from retail dealers, and on the average family consumption of these articles in each city.¹⁵

TABLE 4.—PERCENTAGE CHANGES IN THE RETAIL COST OF 22 FOOD ARTICLES¹⁶ IN FEBRUARY, 1920, COMPARED WITH THE COST IN JANUARY, 1920, FEBRUARY, 1919, AND WITH THE AVERAGE COST IN THE YEAR 1913, BY CITIES.

[Percentage changes of five-tenths of 1 per cent and over are in whole numbers.]

City.	Percentage increase, February, 1920, compared with—		Percentage increase (+) or decrease (—) February, 1920, compared with January 1920.	City.	Percentage increase, February 1920, compared with—		Percentage increase (+) or decrease (—) February, 1920, compared with January, 1910.

¹⁴ For a discussion of the logarithmic chart see article on Comparison of arithmetic and ratio charts, by Lucian W. Chaney, MONTHLY LABOR REVIEW for March, 1919, pp. 20-34. Also, The "ratio" chart, by Prof. Irving Fisher, reprinted from Quarterly Publications of the American Statistical Association, June 1917, 24 pp.

¹⁵ The consumption figure used for each article in each city is given in the MONTHLY LABOR REVIEW for November, 1918, pp. 94-95.

¹⁶ For list of articles see note 2, p. 68.

Retail Prices of Dry Goods in the United States.¹

THE following table gives the average retail prices of 10 articles of dry goods on the 15th of February, May, August, and October, 1919, and on February, 15, 1920. The averages given are based on the retail prices of standard brands, only.

AVERAGE RETAIL PRICES OF 10 ARTICLES OF DRY GOODS ON FEB. 15, MAY 15, AUG. 15, AND OCT. 15, 1919, AND FEB. 15, 1920, IN 51 CITIES.

Index Numbers of Wholesale Prices in the United States.

AS SHOWN by information gathered in representative markets by the Bureau of Labor Statistics of the United States Department of Labor, wholesale prices in the aggregate averaged slightly higher in February, 1920, than in the preceding month. The Bureau's weighted index number, which is built on a larger number of commodities than any other currently published series, registered 249 for February, as compared with 248 for January. Articles belonging to the group of lumber and building materials exhibited the largest increase, the index number rising from 268 to 300, or nearly 12 per cent. Metals and metal products increased 7 per cent and chemicals and drugs $4\frac{1}{2}$ per cent. Somewhat smaller increases were recorded for cloths and clothing, fuel and lighting, and for house furnishings.

On the other hand, the important groups of farm products and food articles each showed a substantial decrease of more than $3\frac{1}{2}$ per cent from January to February, the index numbers dropping from 246 to 237 and from 253 to 244, respectively. In the group of miscellaneous commodities no change in average prices took place.

The following table shows the more important price changes occurring between January and February:

IMPORTANT ARTICLES INCREASING OR DECREASING IN AVERAGE PRICE IN FEBRUARY, AS COMPARED WITH JANUARY, 1920, BY GROUPS OF COMMODITIES.

Measured by changes in the index numbers for the 12 months from February, 1919, to February, 1920, farm products increased nearly 9 per cent in price, food 24½ per cent, and cloths and clothing 60 per cent. During the same time fuel and lighting increased nearly 11

per cent, metals and metal products $12\frac{1}{2}$ per cent, and lumber and building materials more than 84 per cent. Chemicals and drugs increased $6\frac{1}{2}$ per cent, house-furnishing goods nearly 51 per cent, and miscellaneous commodities about 9 per cent in this period.

¹ Preliminary.

Comparison of Retail Price Changes in the United States and Foreign Countries.

THE index numbers of retail prices published by several foreign countries have been brought together with those of this Bureau in the subjoined table after having been reduced to a common base, viz, prices for July, 1914, equal 100. This base was selected instead of the average for the year 1913, which is used in other tables of index numbers compiled by the Bureau, because of the fact that in some instances satisfactory information for 1913 was not available. For Belgium, Denmark, Great Britain, Norway, Sweden, and the city of Rome, Italy, the index numbers are reproduced as published in the original sources. With two exceptions all these are shown on the July, 1914, base in the source from which the information is taken. The index numbers for Belgium are computed on April, 1914, as the base period, while those for Rome are based on the first half of 1914. The index numbers here shown for the remaining countries have been obtained by dividing the index for July, 1914, or the nearest period thereto, as published, into the index for each month specified in the table. As shown in the table, the number of articles included in the index numbers for the different countries differs widely. These results should not, therefore, be considered as closely comparable one with another. In one or two instances the figures here shown are not absolutely comparable from month to month over the entire period, owing to slight changes in the list of commodities included at successive dates.

Retail Price Changes in Great Britain.

THE following table gives for Great Britain the increase over July, 1914, in the cost of food and general family expenditure for March of each year, 1915 to 1920, and for each month in 1920. The food items included in this report are: Ribs and thin flank of beef, both British and chilled or frozen; legs and breast of mutton, British and chilled or frozen; bacon; fish; flour; bread; tea; sugar; milk; butter, fresh and salt; cheese; margarine; eggs; and potatoes.

The table gives percentage of increase and is not one of relative prices. To obtain the relative prices it is necessary to add 100 to the percentage as given, e. g., for January, 1920, the increase in cost of food was 136 per cent, the relative price being 236.

The figures represent two comparisons: First, the increase in prices, based on the same kinds and quantities as used in July, 1914; second, the increase, based on the change in the standard of living, resulting from a substitution of one kind of food for another to meet war-time conditions.

The table shows that retail prices of food were 133 per cent higher in March, 1920, than in July, 1914, and that the increased cost of all items in the family budget was 130 per cent. On account of the lower standard of living at the later date the expenditures of wage earners for food increased only 107 per cent and for all items in the family budget 115 per cent during the same period.

PER CENT INCREASE IN COST OF FOOD AND ALL ITEMS IN FAMILY BUDGET IN GREAT BRITAIN BASED ON JULY, 1914.

¹ Approximate increase if standard of consumption is changed as follows: Eggs omitted; margarine substituted for butter; sugar and fish consumption cut one-half.

² Not including taxes.

³ Based on change in standard of food consumption adopted by the Ministry of Food.

⁴ Including taxes.

⁵ The increase, excluding additional taxation, is 7 per cent less.

Cost of Living in Italy.

A RECENT number of the municipal monthly bulletin of the city of Milan¹ contains three tables showing the increase in the cost of living in Milan during 1918 and 1919. The first of these three tables gives the total weekly expenditure of a workman's family of 5 persons (2 adults, 1 child 10 to 15 years of age, and 2 children under 10 years) for food, clothing, housing, light, fuel, and miscellaneous items for each month of 1918 and 1919 in comparison with the average weekly expenditure during the first six months of 1914.

TABLE 1.—WEEKLY COST OF LIVING OF A WORKMAN'S FAMILY IN MILAN, ITALY, FOR EACH MONTH OF 1918 AND 1919, COMPARED WITH THE AVERAGE PER WEEK FOR THE FIRST SIX MONTHS OF 1914.

[One lire at par=19.3 cents.]

September.....	111.47	170
October.....	117.74	185
November.....	118.53	187
December.....	118.16	187

According to the preceding table the cost of living curve showed a continuous upward tendency in 1918 up to September. In that month it reached its highest level, the cost of living being 177 per cent greater than the average cost for the first six months of 1914. In October, 1918, the corresponding increase was only 149 per cent, and up to May, 1919, the cost of living remained below the high level of September, 1918. In May, 1919, it showed an increase of 184 per

¹Città di Milano. Bollettino Municipale Mensile di Cronaca Amministrativa e di Statistica, vol. 25, No. 12. Milan, December 31, 1919. pp. 531, 532.

cent over the average for the first six months of 1914, and in June, 1919, it rose to the highest point of the year, the increase in that month over the 1914 figures amounting to 191 per cent. In July and August, 1919, there was a slight decrease, but in September it began again to rise, and in November and December it was 187 per cent greater than in the first half of 1914.

Table 2 shows the average weekly budget of a workman's family, and Table 3 shows the average weekly expenditure for food during December, 1919. The weekly expenditures for December, 1919, is compared with the average weekly expenditure for the first six months of 1914 and an index number is computed by assuming the latter expenditure to be equal to 100. Table 3 in which the articles of food are itemized, also shows the quantities of each foodstuff consumed and the price per unit. The quantities shown as consumed in 1914 are based on an investigation made in 1913. Owing to the rationing of certain foodstuffs in December, 1919, and the scarcity of certain nonrationed foodstuffs the quantities consumed weekly in December, 1919, are not the same as those consumed per week during the first six months of 1914. For this reason the table shows first what the weekly expenditure would have been in December, 1919, if the normal quantities of food consumed in 1914 had been consumed in December, 1919, and secondly the actual expenditure in December, 1919, for those quantities of food which were consumed.

¹ Average price of all grades of fresh beef and veal.² Average price of all grades of fresh beef.

A study of the data contained in Table 2 and Table 3 reveals in the first place the remarkable fact that even in prewar times, i. e., during the first half of 1914, 62.09 per cent of an Italian workman's family budget covered expenditures for food. Had the consumption of food been normal in December, 1919, the expenditures for food would have formed 69.72 per cent of the total budget, but, owing to rationing, the consumption of food decreased, so that the percentage for December, 1919, was 62.83. The expenditures for clothing formed 12 per cent of the budget in 1914 and 15.66 per cent in December, 1919, while the percentages for miscellaneous expenditures were

10 and 13.75, respectively. The percentages formed by expenditures for rent and for fuel and light have decreased, the former from 11.4 to 4.3 and the latter from 4.51 to 3.46. The decrease of the percentage for rent is due to the fact that, while the price of all other necessities increased enormously during the war, rents remained nearly stationary owing to legislation preventing increases.

From the table showing the itemized expenditures for rationed and nonrationed foodstuffs it becomes evident that with respect to rationed foodstuffs there was a considerable decrease in the consumption of rice, butter, oil, and bacon. As regards nonrationed foodstuffs, the decrease of consumption was greatest in the case of vegetables, i. e., from 7 kilograms to 1 kilogram (15.4 to 2.2 pounds). This decrease was partly made up by an increased consumption of dried beans and potatoes. The consumption of milk decreased from 5.894 to 4 liters (6.23 to 4.23 quarts). Salt pork, fresh, dried, and preserved fish (with the exception of tunny), chocolate, coffee, and wheat flour while consumed in 1914, disappeared entirely from the list of articles used in December, 1919. The largest items of the weekly food budget in December, 1919, were the expenditures for meat (not including bacon and sausage), 15.60 lire; bread, 7.96 lire; wine, 7.20 lire; lard and other fats, 5.16 lire; beans, 3.90 lire; sugar, 3.67 lire; and milk, 3.44 lire.

The average per cent of expenditure in December, 1919, for the principal groups of items of cost of living of a workman's family in Milan, Italy, is compared in Table 4 with the estimated per cent of expenditure of white families in industrial centers of the United States in October, 1919, as published in the MONTHLY LABOR REVIEW for January, 1920 (p. 98).

TABLE 4.—COMPARATIVE PER CENT OF FAMILY EXPENDITURE FOR THE SEVERAL ITEMS OF EXPENSE IN ITALY AND THE UNITED STATES, 1919.

Item.	Per cent of total expenditure.	
	Milan, Italy, December, 1919.	United States, October, 1919.
Food.....	62.83	38.2
Clothing.....	15.66	16.6
Rent.....	4.30	13.4
Fuel and light.....	3.46	5.3
Furniture and furnishings.....	13.75	5.1
Miscellaneous.....		21.3
Total.....	100.00	100.0

This comparison shows that the average relative expenditure of Italian families for food was much larger and that for rent, fuel and light, and miscellaneous items considerably smaller than the expendi-

ture of American families for the same items, and that the relative expenditure for clothing was nearly the same in the case of urban families of both nations.

Cost of living in Germany, 1914 to 1919.

THE Deutscher Reichsanzeiger (Berlin) for December 19, 1919, publishes the following table showing the estimated amounts required to purchase the "standard food budget" used by Calwer as the basis of his series of computations at the prices prevailing at various dates. The figures represent the estimated weekly cost of food needed by a family of four persons in specified months of the years 1914 to 1919. These figures are based on the average of the official maximum prices from about 200 localities and on the peace-time ration of a seaman in the German Navy.

ESTIMATED WEEKLY COST OF FOOD REQUIRED BY A GERMAN FAMILY OF FOUR PERSONS DURING SPECIFIED MONTHS OF THE YEARS 1914 TO 1919.

[1 mark at par=23.8 cents.]

Month.	1914	1915	1916	1917	1918	1919	Per cent of increase, 1919 over 1914.
	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	
January.....	25.57	29.65	41.26	53.67	56.50	63.65	149
February.....	25.29	31.49	43.40	54.15	56.47	64.93	157
March.....	25.08	32.90	43.47	54.69	57.00	67.30	168
April.....	24.96	34.41	51.78	54.81	57.13	69.65	179
May.....	24.70	35.49	52.29	54.58	57.30	73.70	198
June.....	24.73	37.36	52.61	54.34	57.60	78.65	218
July.....	25.12	38.16	53.47	55.26	58.11	82.51	228
August.....	26.41	39.13	53.53	54.67	59.43	85.45	224

Thus the increase in the cost of food in August, 1919, as compared with August, 1914, amounted to 224 per cent. It is stated that since the beginning of the war the cost of rationed foodstuffs had increased more than three times up to August, 1919, and that since then the prices of fats, eggs, bread, flour, potatoes, milk, etc., have risen considerably. These articles are not the only necessities that have undergone heavy price increases. For example, the rise in the prices of clothing and shoes has been extraordinary. A man's suit, which before the war cost from 70 to 80 marks (\$16.66 to \$19.04, par), cost 600 marks (\$142.80, par) a year ago and now costs 1,000 marks (\$238, par).

According to the Statistical Yearbook for 1919, just issued by the Bavarian Statistical Department, the rise in prices in Munich between July, 1914, and November, 1919, is shown in the following table

taken from Münchner Neueste Nachrichten (Munich) for December 10, 1919:

WAGES AND HOURS OF LABOR.

Wages and Hours in Paper-Box, Women's Clothing, Confectionery, and Overalls Industries.

THIS article presents a summary report on the results of the investigation of wages and hours in the manufacture of paper boxes, of women's clothing, of confectionery, and of overalls. The investigation was a part of the industrial survey of 1919. In the investigation of the paper-box industry were included establishments manufacturing folding boxes, i. e., boxes that are shipped flat to the purchaser, and set-up boxes, or those shipped in the form of made-up boxes. The investigation of the women's clothing industry covered the manufacture of children's dresses, of house dresses and kimonos, of cloaks, suits and skirts, of dresses and waists, and of white goods. These divisions of the two industries named correspond to divisions generally recognized in the trades.

In tabulating the material the occupations of each of the subdivisions of the women's clothing industry are given separately, except that the manufacture of children's dresses is combined with that of house dresses and kimonos. In the paper-box industry such occupations as are fairly comparable in the two divisions of the industry are given once for both, while those peculiar to each branch of the industry are given separately, under the appropriate subheading.

In selecting the establishments to be covered by the survey the attempt was made to include enough in each State to give fairly typical results for the State. No attempt was made to apportion the representation in each State exactly in relation to the number of employees in the State. The number of establishments and the number of employees included in the investigation of each industry is shown by States in Table 1.

Total.....	80	6,113	160	9,022	71	16,086	131	6,911

Because of the conditions under which the survey was carried out it was impossible to obtain the records of all establishments even in a single industry for the same pay-roll period. Owing to the unsettled state of industry immediately after the close of the war, conditions changed so rapidly that the exact date of the material presented is a matter of more importance than it would be in a normal year. The pay-roll periods included in each industry were distributed by months, as shown in Table 2:

TABLE 2.—NUMBER OF PAY-ROLL PERIODS IN SPECIFIED MONTHS, BY INDUSTRY.

Industry.	Total number of pay-roll periods.	Number of pay-roll periods in—							
		1918		1919					
		Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.	June.
Paper box.....	80			43	6	16	12	3	
Women's clothing.....	160		2	30	84	21	23		
Confectionery.....	101	2		8	21	32	30	8	
Overalls.....	131			3	2	9	38	70	9

It will be seen from the table that in the paper-box industry 77 of the 80 pay-roll periods fell within the first four months of 1919; in the women's clothing industry 158 of the 160 pay-roll periods fell within the same time limits; in the confectionery industry the proportion is 91 out of 101 periods; while in the overalls industry 126 out of the 131 pay-roll periods fell in the months of March, April, May, and June, 1919. Information is presented as of the year 1919. In none of the industries, so far as could be ascertained, were there any changes in rates of wages during the progress of the survey.

Method of Gathering and Computing Data.

THE information concerning hours and earnings on which the tables are based was obtained directly from the pay rolls or other records of the companies by agents of the Bureau. Other information was obtained from responsible officials in personal interviews. Wherever the records of the company failed to indicate the time actually worked by pieceworkers during the selected pay-roll period, arrangements were made to have such a record kept for a future period from which record data were afterwards copied. In all cases the figures copied by the agents represented hours actually worked and earnings actually received.

As the material comes to the Bureau the figures for hours and those for earnings are both in incommensurable form on account of inequalities in the length of pay-roll periods and in the time worked by different individual employees. Before they can be presented in tabular form it is necessary to reduce both hours and earnings to a common denominator. The comparable figures selected for use in the following tables are hours worked per day and per week, and earnings per hour and per week. These figures are obtained in the manner described in the following paragraphs:

The hours per day of each employee are obtained by dividing the number of hours worked by him during the pay-roll period by the number of week days, holidays omitted, in the pay-roll period. Thus in the case of pay rolls for a single week containing no holidays, the hours worked by each employee during the pay-roll period are divided by six, whether the employee worked on each of the six days or not. Similarly the hours actually worked by an employee in any establishment during a pay-roll period containing 13 work days were divided by 13, regardless of the number of days on which the employee worked. The resulting figure represents the number of hours per day that the employee would have worked, if his work time had been distributed uniformly among the week days of the pay-roll period.

Of the pay rolls included in the survey of those industries nearly all covered a single week. In the paper-box industry there were 75 one-week pay-roll periods and 5 two-week periods. In the women's clothing industry all of the 160 pay rolls were for a single week. In the confectionery industry 97 were for one week and 4 for two weeks, while in the overalls industry the corresponding figures were 112 for one week, 18 for two weeks, and one for a 14-day period.

By using the average number of hours per week day as a factor it is possible to obtain a figure for the average number of hours worked per week by multiplying that factor in every case by six. With one-week pay rolls the result agrees with the original figure for hours per week actually worked. In the case of longer pay rolls, however,

the resulting figure is hypothetical. It represents the number of hours per week that the employees would have worked in a six-day week if their working hours had been distributed uniformly over the week days of the entire pay-roll period.

This figure of hours worked per week is no more useful for comparisons of hours in different occupations or industries than is the figure of hours per day. It has the advantage, however, of enabling comparisons to be drawn between the hours actually worked on the average by people in each occupation and the full-time hours of the same occupation.

By full-time hours per week is meant the number of hours that is thought of in the occupation as constituting a normal week's work—the number of hours the employee regularly expects to work and the employer expects him to work. This figure was obtained from the officials of the various establishments by the agents of the Bureau. The difference between average actual hours per week and average full-time hours per week is an indication of the degree of irregularity of employment among the employees to whom the figures apply.

Combining hours per day or hours per week computed from the records of one-week pay rolls with those computed from longer pay rolls introduces a disturbing factor which must not be lost sight of in using the figures for comparative purposes. The figures for a group of employees computed for four weeks combined will differ from those computed for the same group of employees for any one of the four weeks separately. This difference is always in the same direction, though varying in amount. The causes and the extent of it are discussed at some length in an article in the MONTHLY LABOR REVIEW for January, 1920 (pp. 121, 122).

The conclusion of that discussion is stated in the following words:

For these reasons it is inadmissible to use the figures of average hours per week day or average hours per week for very close comparisons, without making allowance for the relative number of short and long pay-roll periods on which the averages are based. For practical purposes, however, the figures are sufficiently comparable to give a fairly accurate representation of relative hours of labor in different States, industries or occupations, and of the percentage of the full time of each occupation which the employees in that occupation actually worked.

For comparative purposes the earnings of each employee are reduced to the form of average earnings per hour by dividing his total earnings for the pay-roll period by the total number of hours worked by him during the period. The resulting figure indicates how much he would have earned each hour he worked if his earnings had been distributed uniformly over all the hours actually worked by him during the period.

By multiplying the average hourly earnings of a group by the previously computed average hours per week worked by the same group, a figure is obtained which represents very closely the average

actual weekly earnings of the group. In the case of one-week pay rolls this process brings us back practically to the average actual earnings for the week as computed directly from the actual earnings of the individual employees as reported on the schedules. For employees with longer pay-roll periods, however, the average is not the average of what was actually earned in any one week, but the average of what would have been earned if they had worked the same number of hours on each week day of the pay-roll period. In some respects it is a more significant figure than the actual earnings of a single week. For in general the longer the pay-roll period from which average weekly earnings are computed the more nearly typical may the resulting average be assumed to be.

One other somewhat variable factor involved in the figure for average actual weekly earnings should be pointed out. The practice of working fewer hours on Saturday than on other week days, while by no means universal, is widely prevalent; and the number of hours worked on Saturday varies more or less from establishment to establishment. Whenever fewer hours are worked on Saturday than on other days the theoretical figure for actual weekly earnings described above will express exactly what it professes to express (namely, the amount that would have been earned in a week if the earnings had been uniformly distributed) only in the case of employees for whom Saturdays constituted one-sixth of the total number of days worked by them. In all other cases the figure will vary by a few cents from theoretical exactness. If the number of Saturdays exceeds one in six, the computed weekly earnings will be somewhat too low; if the number is less than one in six, the earnings will be correspondingly high. Careful experiment has shown, however, that these variations offset one another so largely that the net result is a variation of a few cents at the most in the weekly average for the group, a variation so slight that it may be entirely disregarded.

Hours and Earnings of Employees in the Four Industries.

IN TABLE 3 are presented the facts as to hours and earnings of male and female employees in the four industries under consideration. In each industry the figures are given for the whole country for each of the occupations listed in the survey. Figures for each State separately as well as other details concerning each industry will appear later in separate bulletins.

The figures in each column are to be interpreted in the light of the explanations given in the preceding paragraphs. In the column immediately following that showing average full-time hours per week is shown the percentage which the average hours worked constituted of such full-time hours. In view of the explanation already given the figures presented in the table may be left to tell their own story.

Report on Reclassification of Government Employees.

THE Joint Congressional Commission on Reclassification of Salaries of Federal and District Employees in the District of Columbia, which on March 12, 1920, handed in its report to Congress, was created by a rider in the legislative, executive, and judicial appropriation act approved by the President March 1, 1919. The sections establishing the commission are as follows:

SECTION 9. That a joint commission is created to be known as the "Joint Commission on Reclassification of Salaries," which shall consist of three Senators, who are now Members of the Congress, to be appointed by the President of the Senate, and three Representatives, who are now Members of the Congress, to be appointed by the Speaker. Said commission shall submit its report and recommendations as early as possible, and, in any event, by the second Monday in January, 1920, and the members of such commission shall receive a compensation at the rate of \$625 per month, unless they are receiving other compensation from the Government. Vacancies occurring in the membership of the commission shall be filled in the same manner as the original appointments.

It shall be the duty of the commission to investigate the rates of compensation paid to civilian employees by the municipal government and the various executive departments and other governmental establishments in the District of Columbia, except the navy yard and the Postal Service, and report by bill or otherwise, as soon as practicable, what reclassification and readjustment of compensation should be made so as to provide uniform and equitable pay for the same character of employment throughout the District of Columbia in the services enumerated.

The commission is authorized to sit during the sessions or recess of Congress, to send for persons and papers, to administer oaths, to summon and compel the attendance of witnesses, and to employ such personal services and incur such expenses as may be necessary to carry out the purposes of this section.

The heads of the various governmental services and the Commissioners of the District of Columbia shall furnish office space and equipment, detail officers and employees, furnish data and information, and make investigations whenever requested by the commission in connection with the purposes of this section.

For payment of the expenses authorized to be incurred there is appropriated \$25,000, or so much thereof as may be necessary, to be available immediately and to be disbursed upon vouchers approved by the commission; which approval shall be conclusive upon the accounting officers of the Treasury Department.

The amount of money originally granted by Congress for the use of the commission was \$25,000, but it soon became evident that this sum was not sufficient to handle the work that must be done. As a result of hearings before the Senate and House appropriations committees in June, 1919, Congress granted the commission an additional appropriation of \$50,000. The time limit originally set for the submission of the commission's report to Congress was January 12, 1920, but the commission found it impossible to complete its task by the date named. An extension of time was granted by resolution approved January 10, 1920, extending the time of the commission for filing its report to March 12, 1920.

The commission as appointed consisted of Senator Andrieus A. Jones, New Mexico, chairman; Senator Charles B. Henderson, Nevada, vice chairman; Senator Selden C. Spencer, Missouri; and Representatives Courtney W. Hamlin, of Missouri, Henry Allen Cooper, of Wisconsin, and Edward Keating, of Colorado. Its creation was due to a realization of the need for a reclassification, and especially for a standardization of positions and salaries within the Government service. There had been no general adjustment of this kind for over 50 years, and conditions were unstandardized and chaotic to an extent which roused dissatisfaction and interfered with efficiency.

Procedure of the Commission.

THE commission's first task was to secure data as to the work actually performed by the employees with whom they were to deal. For this purpose questionnaires were distributed throughout the various governmental departments, bureaus, and divisions, asking for details of the work done by the recipient, his length of service, his qualifications, salary, experience, and so on. One of these was to be filled out by each employee. To guard against a possible exaggeration of the importance of his work by some too enthusiastic worker, the questionnaire, after being filled out, was submitted for revision to the worker's official superior, who wrote what comment he considered necessary upon the employee's statement, after which it was returned to the employee, who had an opportunity to protest against his chief's judgment if he thought the situation called for such action.

By the end of May, 1919, practically all of these questionnaires, to the number of 104,000, had been filled out and returned to the Reclassification Commission, and the work of classifying the positions was begun. A small force of industrial engineers was engaged to direct the task, but for the most part the work was done by Federal employees detailed from their regular service. At the outset it was decided to classify positions, not employees, on the ground that an employee might be transferred from one job to another, but that the work of a given position should be the same, no matter who held that position. The task was a long and difficult one. Prior to the commission's appointment, there was not even a list of what and how many were the Government positions held by civilian employees in the District of Columbia. The name which a position bore had little relation to the kind of work done, and apparently the kind of work done had little relation to the salary received. The whole list of over 100,000 positions was first roughly classified into 44 different services on the basis of the general nature of the work done, and then within each service a careful classification was made,

the different jobs being grouped, on the basis of qualifications and duties, to form an ascending series from the entrance position to the head of the service. The complexity of the task was much increased by the fact that many positions involved duties falling within two or more different services, and it was often a matter of extreme difficulty to decide in what class a given position properly belonged. In order to help in this matter, and also to aid in setting suitable salary scales after classification had been accomplished, the commission secured the formation of committees of employees within each service, to whom the specifications describing the various positions within their service were submitted for criticism, and who were asked to present salary scales and arguments supporting them. Hearings gave an opportunity for arguments in all services and briefs were submitted by the interested parties—that is, by the administrative officials and the employees, either separately or jointly.

Meanwhile, an advisory committee on wage policy had been formed, consisting of three representatives of the administrative side of the Government service, three representatives of the employees, and four economists. This committee concerned itself with general policies rather than with the salaries to be affixed to given positions. Other committees took up conditions of employment other than salary, such as the matter of annual leave, sick leave, working conditions, opportunities for advancement, and the like, reporting the results of their investigations back to the Reclassification Commission.

As the work of classification proceeded, it became evident that the decision as to a fair standard of compensation required an amount of information on subjects not covered by the questionnaire which could be supplied only by special inquiries, and the Division of Economic and Employment Research was formed. One important task undertaken by this body was an investigation to secure material for a comparison between Government salaries and those paid outside for similar work. Committees consisting of representatives of the Government employees, of the administrative side of the service, and of the public were asked to recommend sources for the collection of such data, and by their help a list was prepared of establishments within the "Washington Zone," bounded by Boston on the north, Pittsburgh on the west, and Richmond on the south, which would fairly represent conditions among the better class of employers outside of the Government service. Agents to conduct the investigation were detailed from different Government agencies. As soon as the reclassification staff had prepared specifications setting forth the duties of given positions and the qualifications required to fill them, the agents were given these specifications and sent out to secure

from the selected employers data as to the wages, hours, necessary qualifications, vacation and sick leave privileges, etc., of their employees in similar positions. Some 3,200 schedules were gathered in this way, covering over 35,000 different employees. This material was tabulated so as to show the minimum, the maximum, and the weighted average salary paid for these outside positions, and was presented for the consideration of the commission, together with a similar tabulation of the salaries paid within the Government for corresponding positions.

The report submitted by the reclassification Commission will be discussed in later issues of the MONTHLY LABOR REVIEW. Its most important points are the definition and classification of the Government positions which it presents, its provision for advancement on the basis of proved efficiency after the service has been entered, its plan for promotion from one class to another, its definite relation of a specified salary to specified duties, its recommendation for a continuing body to administer its provisions, and its suggestion for the creation of an advisory council to act with the administrative body in interpreting and applying the different provisions. Its salary recommendations are conservative; on the whole, they represent an increase, though this does not hold true without exception. A standard annual leave of 30 days is recommended, this to be a matter of right, not favor; and the employee is entitled to appeal if it is denied him. On the other hand, the annual amount of sick leave is cut to 10 days, but this may be cumulative to the amount of 60 days.

Average Wages of Farm Labor in the United States in 1918 and 1919.¹

AT NO other time since 1866, when the first investigation of this subject was made by the Bureau of Crop Estimates, United States Department of Agriculture, were the wages rates of farm labor so high in this country as they were in 1919. Averages for the United States are in mind, and not local rates. For labor hired by the month with board, the average rate was \$39.82, and among the geographical divisions the average was as low as \$30.54 in the South Atlantic and as high as \$62.96 in the Western, including the Mountain and Pacific States. Without board, the average for the United States was \$56.29, and the lowest was \$44.03 in the South Atlantic division and the highest, \$87.12, in the Western division. Extras, such as firewood, milk, etc., are not included.

¹ From Weekly News Letter, Feb. 4, 1920. Department of Agriculture, Washington.

Harvest wages per day with board reached the top figure of \$4.48 in the North Central States west of the Mississippi River and the lowest figure of \$2.28 in the South Atlantic States, and the United States average was \$3.15. Without board, the United States average of \$3.83 was most exceeded by \$5.33 in the former States, while the latter States had the lowest average, \$2.82.

Statements in similar form for day wages for work outside of harvest with board make the United States average \$2.45, that of the North Central States west of the Mississippi River \$3.22 and of the South Atlantic States \$1.85; the rates without board, in the same order, were \$3.12, \$4.03, and \$2.39.

The following table gives a comparison of the wages received by farm labor in 1918 and 1919, with per cent of increase in 1919 over 1918:²

WAGES OF FARM LABOR IN 1918 AND 1919, SHOWING PER CENT OF INCREASE IN 1919.

Year.	Monthly wages.		Daily wages, at harvest.		Daily wages, not at harvest.	
	With board.	Without board.	With board.	Without board.	With board.	Without board.
1918.....	\$34.92	\$47.07	\$2.65	\$3.20	\$2.07	\$2.63
1919.....	39.82	56.29	3.15	3.83	2.45	3.12
Per cent of increase in 1919.....	14.02	19.59	18.87	19.69	18.36	18.63

Earnings in Manufacturing Industries in New York State, December, 1914 and 1916 to 1919.

THE average weekly earnings in manufacturing industries in New York State in December of each year 1914 to 1919, except 1915, are tabulated in the December issue of the Labor Market Bulletin, published by the New York State Industrial Commission. The following table reproduces these figures by industries, so far as they apply to the State as a whole, with average figures for industries in New York City alone and for industries in the State outside of New York City. In order to determine at a glance the extent of the increase of earnings in 1919 over earnings in 1914, a column showing these increases in terms of per cent has been added to the table; this column does not appear in the original table. A comparison of earnings of New York State factory workers and retail prices of food appeared in the February issue of the MONTHLY LABOR REVIEW (p. 128).

² Data taken from Crop Reporter for December, 1919. Department of Agriculture, Washington.

Factories outside New York City.....	12.40	15.83	18.32	23.77	25.63	106.69

¹ Includes all employees in both office and shop. It is commonly the case that office salaries are higher than the average earnings of shop employees. However, the office employees form such a small percentage of the total number of workers that their effect, in the computation of the average earnings, is negligible.

Changes in Wages and Hours of Labor in Great Britain.

THE increasing extent to which wages have been advanced and the reduction that has taken place in the number of hours of work are indicated in returns issued on December 19 by the British Ministry of Labor, according to a report from the American consul general at London, published in Commerce Reports (Washington) for January 9, 1920.

Additions granted during the month of November added substantially £480,000 (\$2,335,920, par) to the weekly wages of approximately 1,900,000 workpeople, and during the first 11 months of 1919 5,343,000 people secured increases aggregating £1,908,900 (\$9,289,662, par) weekly, or nearly £100,000,000 (\$486,650,000, par) per annum. The largest number of workpeople affected was in the engineering and shipbuilding trades, namely, 1,329,000, or 24.9 per cent; and the largest wage advance was given to coal miners, namely, £587,000 (\$2,856,636, par), or 30.8 per cent of the total.

The report states that announcement has been made of awards of the court of arbitration concerning the applications of electrical workers and of farriers employed by the London County Council, the corporations of Croydon and Wimbledon and other urban districts, and the various electrical supply companies and tramway undertakings in the metropolitan area who demanded an increase of 15s. (\$3.65, par) per week. Under these awards electrical workers 18 years of age and over and electrical operators working on railroads within the London district have been given an advance of 5s. (\$1.22, par) per week. The farriers, who claimed 3s. (73 cents, par) per day more have been given 1s. 6d. (36.5 cents, par), while firemen's pay has been advanced to 13s. 9d. (\$3.35, par), and doormen's to 13s. 2d. (\$3.20, par) per day.

Beginning with April 1, 1920, according to a ruling by the London County Council, senior superintendents of the fire brigade will receive £575 (\$2,797.24, par) per annum, rising to £625 (\$3,041.56, par); superintendents, £475 (\$2,311.59, par); subofficers, £5 10s. (\$26.77, par) per week. Firemen will commence with £3 10s. (\$17.03, par), rising to £4 8s. (\$21.41, par), and, subject to passing an examination, to £4 13s. (\$22.63, par) per week.

The consul general further reports that in November, 1919, 30,000 workpeople had their hours of labor reduced on an average of three hours each, or 90,000 hours for the month, and that the changes effected in this respect during the first 11 months of 1919 aggregated 36,211,000 fewer working hours, the number of workpeople affected totaling 5,479,000.

MINIMUM WAGE.

Minimum Wages in the District of Columbia.

THE Minimum Wage Board of the District of Columbia has presented its second annual report,¹ covering its first real activities.

The law went into effect in September, 1918, the wage board being appointed in the following month. The first order fixing wages bears the date of June 13, 1919, so that the subject matter presented is really that of a new organization.

A striking fact in connection with the enactment of the minimum wage law for the District was the friendly attitude of the Merchants' and Manufacturers' Association. No opposition to the law was ever offered, and the board states that whatever success has been attained in the administration of the law "is due in no small measure to the active cooperation of the Merchants' and Manufacturers' Association." Organized labor likewise favored the enactment of the law and has been active in its support. The position of the District board is therefore unique in a number of respects. Both parties affected by the law have favored it from the beginning, and the District officials and the public have shown cordial sympathy with it at all times. Employers have served freely on the conferences, appointing therefor their strongest representatives; employees have been willing and eager to serve, hotly contested elections being held to determine nominees for positions on the conferences; and only two persons considered as representatives of the public have refused to serve, and then only by reason of pressure of other work. The area served by the District board is restricted, making for homogeneity of conditions and ease of administration. It is estimated that about 15,700 women come under the law.

Surveys have been made in three groups of industries, the first covering printing, publishing, and allied industries, employing about 900 women; the second covering mercantile employment, with about 7,000 women; and the third including the hotels, restaurants, and allied industries, with about 2,500 females employed. Wage surveys were made in each group, covering in all 7,563 women. The following table shows the conditions existing at the time of the investigations:

¹ Second annual report of the Minimum Wage Board of the District of Columbia for the year ending Dec. 31, 1919. Washington, 1920, 60 pp. The full text of the law is given in the MONTHLY LABOR REVIEW for October, 1918, pp. 171-181.

NUMBER AND PER CENT OF WOMAN WORKERS RECEIVING EACH CLASSIFIED WEEKLY RATE, BY INDUSTRY.

Number.

Industry.	Woman workers whose rate of wages per week were—									Total.
	Under \$9.	\$9 and under \$10.	\$10 and under \$11.	\$11 and under \$12.	\$12 and under \$13.	\$13 and under \$14.	\$14 and under \$15.	\$15 and under \$16.	\$16 and over.

Per cent.

Printing, publishing, and allied industries.....	3.4	3.2	11.0	5.1	14.4	9.1	3.9	12.2	37.7	100.0
Mercantile industry.....	9.8	4.9	13.5	2.4	21.0	2.7	6.1	13.9	25.7	100.0
Hotel, restaurant, and allied industries.....	5.1	8.0	3.5	1.8	11.9	4.0	9.3	15.3	41.1	100.0

In arriving at the wages of hotel, etc., employees, allowances were made where board and lodging were provided, and it is the opinion of the board that the actual wage situation in these industries is not accurately disclosed by the table, but is as bad as in the other two groups, if not worse. The allowance of \$6 for board and \$3 for room is believed to be too high for the type of accommodations furnished. The fact that in a recent investigation of the cost of living of wage-earning women in the District of Columbia by the United States Bureau of Labor Statistics it had been found that \$16 was approximately the necessary standard for a living wage, led to the adoption by the board of this amount as a tentative minimum cost of living figure.

The lowest percentage of women receiving \$16 or more per week was found in the 5 and 10 cent stores, where but 5.9 per cent of the women were thus paid. Marked differences in wage rates between stores of the same type were found, and also a wide range within an individual establishment. In fact standardization seemed to be entirely lacking and even avoided. "It was a general practice in stores to instruct the new employee that she must on no account tell her fellow workers what wage she was receiving, and these secrets were apparently well kept." This made it possible to pay different amounts for the same kind of work, and also for the aggressive individual to secure an advance, while "the woman who did not ask for a raise seldom received one." There was a greater uniformity in the hotel and restaurant industries.

Conferences representing employers, employees, and the public in equal numbers (three of each) were held for each industry considered. Representatives of employers and employees were chosen by the persons interested, six names to be submitted, from which the

board selected three, designating also the chairman of the conference. The conference on printing, publishing, and allied industries held its initial meeting on March 4, 1919, and met weekly until April 8, 1919, at which time it adopted a report recommending the minimum rate of \$15.50 per week, with provisions for learners. A public hearing was held on June 14, 1919, but no protest being submitted, the rate was promulgated to take effect on August 13, 1919. The rate fixed is applicable to experienced females, by which term is meant one who has been employed in the industry one year or more. Learners are to be paid not less than \$8 per week for the first three months, \$9 per week for the second three months, not less than \$11 per week for the third three months, and not less than \$12 per week for the fourth three months, after which the established minimum is payable.

The mercantile board held 10 meetings between May 21 and July 12, and recommended a wage for experienced women of \$16.50 per week. The difference between the two rates was said to be due to the fact that women in the printing trades could wear aprons and less expensive clothing at work, while the greater majority of the mercantile employees must present a proper appearance to the public. Learners 18 years of age or more must receive not less than \$12.50 per week for the first three months of employment, and not less than \$14.50 for the following four months, after which time they are to be considered experienced workers. A rate for learners under 18 was also fixed, but was protested by the Merchants' and Manufacturers' Association as being too nearly the same as for adults. The question of providing a lower rate was earnestly discussed, employers arguing that the high wage offered would act as an incentive to minors to leave school, but that they would be thrown out of employment when the expiration of the learning period would require the payment of the full minimum rate. The labor representative on the board, on the other hand, argued that a high wage would discourage employers, preventing the hiring of minors, so that they would remain in school until a more mature age when the minimum would be actually earned. A compromise measure was adopted, however, reducing the rate for minors under 18 and providing for an entrance rate of not less than \$10 for the first four months of employment, of not less than \$11.50 for the next four months and of not less than \$14.50 for the following 6 months, after which not less than \$16 per week should be paid until the age of 18 is reached. No time served prior to the sixteenth birthday is to be considered as experience in determining the minimum wage.

As already indicated, good administration has been facilitated by the cooperation of all parties affected. But few violations of the law have been found, and no proceedings have been instituted therefor. Collections have been made through the board where less than the

legal rates were paid, amounting to \$186.96, ranging in amounts from \$137 to \$8. Learners' certificates are used, and these are found to be of great value as protecting both the employers and the employees. Some experienced workers have been found who attempted to begin service in other places as learners on account of difficulty in securing employment at the minimum rate. The employer is liable to be penalized if he gives employment to such persons, therefore the learner's certificate, on which the applicant must enter all prior service, is his best safeguard.

Licenses for substandard workers are provided for, of which 51 have been issued, nearly all (48) being in the mercantile industry. Of the total, 45 were for women whose capacity had been impaired by age, 3 were to subnormal girls, and 3 were for short periods to women whose present physical condition would not permit regular work.

The effects of the law have been for too short a time under observation to make final conclusions possible. However, there has been a definite increase in the amount of wages paid, without any considerable replacement of women by men. There has also been a tendency to raise wages in other industries for which no orders have been issued, since the mercantile rate of \$16.50 affects such a large proportion of the employed women of the District. The contention that the minimum tends to become the maximum is disproved by the experience thus far developed. Some degree of hardship has resulted in the case of women incapable of measuring up to the higher standards necessitated by the higher costs of service. This situation affects the District of Columbia the more seriously since there are so few occupations available to women seeking employment. Factories are few, and the positions generally available require at least a woman of ordinary ability to compete successfully. The special license is a partial solution, but leaves the substandard worker without a living wage. However, it is felt that the substandard worker must be cared for in some other way, and that the minimum wage law fills its purpose well in securing an adequate basis of support for the vast majority of workers for whom these provisions are made.

Minimum Wages for Women in Certain Industries in British Columbia.

ACCORDING to the Canada Labor Gazette for February (pp. 169, 170), the British Columbia Minimum Wage Board has recently issued orders fixing minimum wages for women in the fishing industry and in the fruit and vegetable industry. These orders were effective February 28, 1920, and follows.

Fishing Industry.

The minimum wage for every experienced female in this industry who is of the age of 18 years or over (except women to whom a special license may be issued under section 10 of the Minimum Wage Act) shall be at the rate of \$15.50 per week. The minimum wage for every inexperienced female who is of the age of 18 years or over (except women to whom a special license may be issued) shall be at the following rate: Not less than \$12.75 for the first four months, \$13.75 for the second four months, and \$14.75 for the third four months.

The fishing industry is defined as including the work of females engaged in the washing, preparing, preserving, drying, curing, smoking, packing, or otherwise adapting for sale or use, or for shipment, any kind of fish except in the case of canned fish. An "experienced female employee" is one who has worked in the fishing industry for a period of at least 12 months, while an "inexperienced employee" means one who has worked in the fishing industry for a period of less than 12 months.

Fruit and Vegetable Industry.

The minimum wage for every experienced female employee engaged in the fruit and vegetable industry, who is of the age of 18 years or over (except women to whom a special license may be issued), and who is employed on a time-rate basis, shall be the sum of \$14 for a week of 48 hours. The minimum wage for every inexperienced female in this industry, who is of the age of 18 years or over, and is employed on a time-rate basis, shall be the sum of \$10 a week for the first month, \$11 a week for the second month, and \$12 a week for the third month. Where payment of wages is made on a piece-rate basis instead of a time-rate basis in the preparation of any product, the minimum piece rates shall be such as will produce the wages mentioned above. In an emergency period the hours of labor for an employee may be extended to 10 hours a day or up to 60 hours in any one week. The minimum wage for an employee during the time of labor in any day in excess of eight hours, and up to and including 10 hours a day, shall be such as will produce a wage of 30 cents an hour. The minimum wage, whether on time-rate basis or a piece-rate basis, for an experienced female employee who is of the age of 18 years or over, during the time of labor in any day in excess of 10 hours, shall be such as will produce a wage of 45 cents an hour.

The Labor Gazette states that in this order the expression "fruit and vegetable industry" includes the work of females engaged in canning, preserving, drying, packing, or otherwise adapting for sale or use, any kind of fruit or vegetable. "Experienced female employee" is defined as a female who has worked in the industry for at least three months, while an "inexperienced female employee" is one who has had less than three months' experience. "Emergency period" means a period of 90 days in any 12 months during which the hours of labor for female employees may be extended.

COOPERATION.

Consumers' Cooperative Wholesale Societies in the United States.

By FLORENCE E. PARKER.

ONE writer on the cooperative movement states that "the test of a really established movement, undoubtedly, is the existence of a federation."¹ If this is true, the cooperative movement in the United States is established, or is rapidly becoming so.

During the past few years the number of cooperative enterprises has increased rapidly. No statistics relative to the extent of the movement are available. The Cooperative League of America estimates, however, that of consumers' societies alone there are probably 3,000 in the United States, with a membership of over 500,000.² The combined buying power of these societies is placed at about \$200,000,000 yearly.³

The isolated independent cooperative store is, nevertheless, at a great disadvantage in its purchasing. It can not, by itself, compete very successfully with the large department stores or chain-store systems, because it can not hope to obtain, on its small orders, the low prices obtained by the latter on their enormous ones. Leaders in the cooperative movement have long realized the advantages of a wholesale society, and as a result of their efforts there are now in existence a number of district wholesale societies formed during the past decade. Of recent years, however, a movement has been under way looking toward federation along national lines. This plan took shape during the First American Cooperative Convention held in September, 1918, at Springfield, Ill., in the organization of the National Cooperative Association. This step was taken with the idea that the national body would take over the operation of the district wholesales as soon as this could be done without disturbing their functioning.

Organization was perfected, offices and a warehouse were secured in Chicago, and the National Cooperative Association began operations about the 1st of November, 1919. Branch wholesale warehouses have been established at Seattle, Wash., and Hoboken, N. J. It is planned

¹ Albert Sonnichsen: *Consumers' Cooperation*. New York, Macmillan Co., 1919, p. 62.

² The story of cooperation, published by Cooperative League of America, 2 West Thirteenth Street, New York, 1919. p. 15.

³ Estimated by National Cooperative Association, Chicago.

to establish additional wholesales at Los Angeles, Kansas City, Omaha, Denver, and other points.

At the first annual meeting of the association held March 15, 1920, the word "wholesale" was added to the name of the association.

Following is a directory of the National Cooperative Wholesale Association and the district wholesales:

National Cooperative Wholesale Association, Main Office, 342 River Street, Chicago, Ill.

National Cooperative Wholesale Association, Northwestern Branch, 1206-1208 Western Avenue, Seattle, Wash.

National Cooperative Wholesale Association, New York Branch, 1113-1115 Clinton Street, Hoboken, N. J.

Organization and Purposes of the Wholesale Society.

THE wholesale association performs for its members, the retail societies, the same function that the latter perform for their members; the local society saves the profit of the retailer, the federated society saves the profit of the commission merchant and jobber. The following description of the benefits derived from the English Cooperative Wholesale Society by its members would apply equally to a similar society established in this country:

It was not of marked benefit to the larger societies, which were already able to buy in big quantities and deal independently with manufacturers and agricultural producers, but the majority of them joined through the enthusiasm of their leading members. It was to the smaller units of the movement that the wholesale came, often as a saving institution. First of all, it solved the discouraging problem of buying on the wholesale market, a difficulty especially terrifying to amateurs. It saved also the expense of buying; not only the higher salaries which must be paid men with such ability, but the time which they must devote to this function. It was far better able to insure quality and purity, since it could afford to employ men who were experts in judging. Its growing purchasing power could enable it to obtain better bargains; this, of course, was one of the chief arguments in its favor. It saved the stores the profits of the middlemen. Finally, it encouraged the formation of new societies, thereby providing a stimulus for the further expansion of the movement, for it eliminated many of the important causes of failure.⁴

The plan of organization of the cooperative wholesale societies in the United States follows that of the cooperative retail associations⁵ and is substantially as follows:

1. Membership is usually restricted to cooperative organizations conducted on the Rochdale plan and to cooperative buying clubs, though individuals are sometimes admitted. Organizations operating for profit are excluded.

⁴ Albert Sonnichsen: *Consumers' Cooperation*. New York, Macmillan Co., 1919. pp. 33, 34.

⁵ For a detailed discussion of the retail cooperative stores and the plan under which they operate, see *MONTHLY LABOR REVIEW*, March, 1920, pp. 138 to 145.

2. Capital investment required of each local association ranges from \$100 to \$1,000. In some instances the sum varies with the size of the local societies.

3. Retail organizations are entitled to be represented at the meetings of the wholesale by one or more delegates chosen from their membership, the number being either absolute or based on the size of the society.⁶ The affairs of the wholesale society are managed by a board of seven or nine directors elected either from the delegates or from the members of the constituent stores.

4. Business is conducted on a cash basis, at prevailing wholesale prices, and savings are returned to member associations on the basis of patronage.

The cooperative wholesale society as found in the United States differs in one important respect from the English cooperative wholesale society. The English wholesale is purely a federation of independent local associations. The American type of wholesale society is not so much a federated as a centralized society, having both wholesale and retail activities, with final control of the retail branches remaining in the wholesale society. In this type of society, the retail stores have less independence than is the case in England. The societies studied diverge from the federated type in varying degree, however, as will be seen from the descriptions given later in this article.

The question of the degree of control which should be exercised by the wholesale society over its members is a matter of some controversy among leaders in the movement in the United States. The Cooperative League of America is the chief critic of this centralization of power.

Educational Work.

One of the main services a wholesale may perform is along the lines of educational work. To this end the societies studied annually appropriate from the savings an amount ranging up to 10 per cent of the savings after deduction of interest to be paid on capital stock. The societies use this fund to furnish information, literature, lectures, stereopticon slides or even moving pictures on the cooperative movement. Most of them publish weekly or monthly magazines for the benefit of their members.

Bookkeeping and auditing service.—The wholesale society may be of especial service in introducing a satisfactory and uniform system of bookkeeping and auditing. Lack of such a system has been a potent cause of failure of cooperative stores. It is interesting, therefore, to note what the wholesale societies studied are doing in this respect. In two of the societies—the Pacific Cooperative League and the Tri-State Cooperative Association—the bookkeeping of the local associations is done at the central office of the wholesale, as is also the auditing of the association's accounts. The Cooperative Wholesale Society of America requires that its member stores install a certain system of accounting. They may have their bookkeeping and

⁶ The Scottish Wholesale Society bases representation on members' purchases through the society. So far as is known, no wholesale society in the United States follows this practice.

auditing done by the society, but this is not required. The Cooperative Central Exchange furnishes assistance in installing, but does not require, a uniform system of accounting. It also furnishes auditing service. The Central States Cooperative Society does not require any particular system of bookkeeping nor does it supply this or auditing service to its members. It has, however, issued a form which it recommends and which, it is stated, is "quite generally used" by the affiliated associations.

Courses in cooperation.—The Tri-State Cooperative Society, as a part of its educational work, is opening a school of cooperation whose first session will be held from January 30 to June 11, 1920. The purpose is "to begin general educational work in the interest of the cooperative movement in all its aspects and to afford specific training to prospective workers in the various departments of cooperative enterprise." Two courses are offered, the first, "Store management"—including such topics as cooperative advertising, organization of working force, systematization of business and delivery service, elements of accounting, sources of waste, standards of efficiency, etc.—open only to persons expecting to seek positions in the cooperative movement or already holding such positions, and the second, "Scientific principles of cooperation," open to "all persons of serious interests."

A short course in cooperation, attended by about 40 students, was given by the Cooperative Central Exchange in 1919 and plans are being made for giving a similar course this year.

National Cooperative Wholesale Association and Its Branches.

AS HAS been said, the National Cooperative Wholesale Association was organized at the first National Cooperative Congress held at Springfield, Ill., in September, 1918, but did not begin operations until about the 1st of November, 1919. The association is incorporated, under the laws of Wisconsin, for \$1,000,000, divided into 10,000 shares of \$100 each. Only cooperative associations organized on the Rochdale plan are eligible to membership. Each member society must subscribe for three shares for each one hundred (or major fraction thereof) of its members; for every 500 members it is entitled to a delegate to represent it at the meetings of the association. Under an amendment just adopted (Mar. 15, 1920), hereafter an association applying for membership will be required to subscribe to the wholesale a sum equal to 25 per cent of its capital stock.

The association has its general office and a five-story wholesale warehouse in Chicago, and branches in Seattle and Hoboken.

The president's annual report states that on March 15, 1920, 167 cooperative stores were affiliated with the national body.⁷ The mem-

⁷ National Cooperative News, Chicago, Mar. 27, 1920.

bership of the National Cooperative Association will of course be greatly increased with the taking over of each of the district wholesales, with its affiliated societies.

The affairs of the association are managed by a board of seven⁸ directors, one being elected from each of the seven principal cooperative districts. Three of these directors serve respectively as president, vice president, and secretary-treasurer.

The association has established an organization department that is assisting in organizing, on the chain-store plan, stores in the district of each of the branch wholesale societies.

The association has been established too short a time for one to judge of its success. The report of the first two months' operations, however, showed a volume of business amounting to over \$150,000, and a net gain of over \$5,000, which will be returned to the member societies on the basis of patronage.

The president of the association states that the association plans to cooperate in its purchasing, with the various producers' cooperative organizations in the effort to "bridge the gap between producer and consumer without profit or profiteering." Cooperative stores tributary to Chicago, New York, and Seattle are being supplied from the warehouses of the cooperative wholesale associations at each of these points. The wholesale society is handling the product of the cooperative milk condensary at Tolt, Wash. It is stated that arrangements have been made with the new cooperative salmon cannery at Port Angeles, Wash., by which the wholesale society will act as agent for the sale of the cannery's entire output. The National Association is also cooperating with the Railroad Brotherhoods in the sale of the products of their newly acquired clothing factories.⁹ The product of a cooperative cigar factory in Chicago is handled by the wholesale society.

Carrying out the policy of cooperators to deal with cooperators wherever possible, the National Cooperative Association has placed orders with the English Cooperative Wholesale Society at Manchester, for a supply of woolen cloth.⁹

The National Association is a member of the International Cooperative Alliance.

District Cooperative Wholesale Societies.

Pacific Cooperative League.

THE center of the cooperative movement in California is the Pacific Cooperative League, with headquarters and a wholesale company, the Cooperative Wholesale Co., in San Francisco. The league was formed in 1913 in the attempt to save the situation created by

⁸ This number was increased to nine on Mar. 15, 1920.

⁹ National Cooperative News, Chicago, Feb. 14, 1920.

the failure of an earlier movement begun about 18 years ago. The failure of these early stores is laid to "lack of mutual support; lack of experience and education in cooperation; lack of friendly wholesale facilities."

Membership in the Pacific Cooperative League is open to cooperative stores, organized clubs, firms, and corporations on payment of \$5 entrance fee, \$100 share capital, and \$900 loan capital. In order that individuals may enjoy the trading, social, and educational features of the league without assuming the liabilities of the regular member, provision is made for "associate" memberships. Associate members pay \$5, which entitles them to the advantages the league offers, as long as they take "continuous advantage" of them.

Though no attempt is made by the league to induce established stores to affiliate, the feeling being that it is better for the stores themselves to take the initiative, many stores, realizing the advantages of federation, have joined the league. A large number of these stores, on affiliation, are not solvent and have to be carried "on probation" until they become so. In these cases the league takes over their bookkeeping and does their buying, and is generally able to reestablish them financially.

Organization work is an important part of the league's activities. Stores are organized, however, only when the cooperative spirit is sufficiently strong and widespread to give a reasonable assurance of success. According to the secretary of the league, in the "average community," 200 members, each subscribing from \$35 to \$50 for capital and organization expense, are required.¹⁰

Each store has local autonomy. It makes its own by-laws, and elects its own directors and a representative to serve on the Central Board of Delegates of the league.¹¹ From these delegates are elected the seven directors who form the Central Board of Directors which manages the affairs of the league. The manager of the store, however, is selected by the league.

Each store declares its own dividends on purchases, after fulfilling certain requirements of the league as to interest on shares, and reserve and educational funds. It is hoped that as the business methods become more established dividends may be made uniform for all stores under the league, as has been done in the case of the cooperative stores within the city of Seattle and by the Tri-State Association in its stores.

Individuals, members of an association, are permitted transfer privileges to another association, and any member removing from the vicinity of a store entirely becomes a member at large for life,

¹⁰ Pacific Cooperator, San Francisco, October, 1919, p. 9.

¹¹ When the membership exceeds 250 it may subscribe for another membership share and contribute another \$900 loan capital, thus becoming entitled to a second delegate to the Central Board of Delegates.

and is entitled to buy direct from the nearest wholesale or other center at wholesale prices.

The branches are required to conform to certain strict business requirements. Thus, expenses may not be paid out of capital stock, but only from actual earnings on sales. This is stated to be no hardship where, as is required by the league, a store starts with a sufficient number of members and subscriptions for capital shares.

A centralized form of bookkeeping is in operation under which, it is estimated, the cost is about one-third the cost where each store does its own bookkeeping. There is, of course, the additional advantage of assured efficiency in bookkeeping. The charge made by the league for this service varies from \$15 to \$50 per month, according to the amount of business done by the store. Regular audits and inventories are made, and monthly meetings are held at each store. The buying is all done by the wholesale company of the league.

The league's operations, begun in California, have gradually extended into Arizona and New Mexico. It was reported that on October 6, 1919, the league had or was organizing branches at 32 towns in California and Arizona. Seventeen of these for which data were given had a combined membership of 3,600.

It is also reported that a cooperative grocery store in Hilo, Hawaii, known as the Rochdale Cooperative Association (Ltd.), with nearly 400 members, has affiliated with the Pacific Cooperative League.¹²

International relationships.—The league is a member of the International Cooperative Alliance. Early in September, 1919, several directors of the English Cooperative Wholesale Society visited San Francisco in the course of a tour made for the purpose of making international trade arrangements. It is stated that the directors have taken the preliminary steps for mutual buying between the Cooperative Wholesale Co. of San Francisco and their own society and that hereafter all purchases of the English society made in this section of the United States will be made through the Pacific Cooperative League.¹³ The league has also been asked by the Russian cooperative unions to act as their agent in purchasing in this country.

Effect of federation.—The president of the league says, "We have not had a single store fail. On the contrary, every store has not only paid its way from the start, but has paid a dividend."

He feels that there is an encouraging degree of individual cooperative development in the league stores, and the loss of initiative that might have been expected has not been evident.

There is more live cooperative sentiment and interest manifested and more attention to business than in the ordinary efforts of the old independent stores. The same strong men that come to the top in independent stores come to the front in the federated

¹² National Cooperative News, Chicago, Jan. 24, 1920.

¹³ Pacific Cooperator, San Francisco, September, 1919, p. 3.

stores, and with the advantage that their valuable services can be shared in over a larger area and not submerged in the struggle to keep one little place alive.

We believe we see in the federated plan a natural growth conforming to modern conditions, which are all in the direction of amalgamation. The problem of securing education and wholesale advantages for cooperative stores has been a serious one for many years. By a close form of federation I believe we are going to secure these results in a very successful measure.

Cooperative Wholesale Society of America.

The Cooperative Wholesale Society of America, with headquarters in St. Paul, is the wholesale society of the cooperative associations operating in Minnesota, the Dakotas, and Montana. The society was incorporated in the fall of 1917 with a capitalization of \$10,000, which was successively increased to \$100,000 in May, 1918, and to \$1,000,000 in July, 1918. Cooperative associations operating under the Rochdale plan, cooperative corporations, and unincorporated cooperative societies are admitted to membership on purchase of \$1,000 worth of capital stock. About 28 societies are now affiliated with the society, having a combined membership estimated at between 4,000 and 5,000. This number includes both producers' and consumers' associations, farmers' enterprises being prominent among the affiliated societies.

The wholesale does business at the current wholesale prices, and the surplus, after a deduction is made for reserve and educational funds, is returned to members in proportion to their patronage and to employees on their wages. Nonmembers receive one-half the rate of dividend of members.

The society is interesting because of the fact that it combines both phases of the cooperative movement. It buys for the consumers and sells for the producers, maintaining separate buying and marketing departments. The society states that, doing business as it does, at regular wholesale prices, it is "recognized as a regular wholesaler by the trade." The marketing department makes a specialty of marketing farm produce from its affiliated producers' societies, and it is stated that the activities of this department have resulted in a "substantial saving" to both the consumers' and producers' societies.

The association also maintains an organization department. It does not, however, undertake the establishment of a store except on request from the members of a locality. No attempt is made to induce cooperative associations and stores already established to affiliate with the society. Associations desiring affiliation are required to have a certain minimum amount of capital before being admitted, and must sign a contract binding themselves to do all their purchasing through the wholesale. All affiliated stores must conduct their business on a cash basis.

Cooperative Central Exchange.

The Cooperative Central Exchange is a Finnish wholesale society operating in Superior, Wis. The exchange was organized at a conference of 16 Finnish cooperative stores held at Superior in July, 1917. It now has a membership of 42 cooperative associations, located in Wisconsin, Minnesota, and Michigan, the combined membership of which is about 5,000. Eighty additional organizations are listed as purchasers through the exchange.

Its sales during 1919 amounted to \$310,322, and its net profits to \$7,330. During the fall of 1919 a manufacturing bakery department was established, specializing in rye-flour products, such as hardtack and toasts, the net profits of which, up to January 1, 1920, amounted to \$1,879.¹⁴

The exchange leaves the matter of affiliation with it to the local associations, but carries on educational work toward that end. Such associations, before being admitted to membership, must purchase at least one \$100 share of stock. The exchange furnishes aid in establishing new stores when requested to do so by the residents of a locality.

Branches and local cooperative organizations are not required to make all their purchases through the society. At the annual meeting of the exchange held on February 21 and 22, 1920, however, a resolution was passed "instructing affiliated stores to buy at least the commodities bearing the trade-mark of the exchange and all goods it can handle direct from manufacturers and producers."

At this meeting provision was made for an educational director who besides his regular educational duties, must "obtain and keep a list of persons in the employ of cooperative organizations and those seeking employment along those lines, and obtain reliable information in reference to their experience, in order to aid cooperative associations in obtaining employees."

Central States Cooperative Society.

It is estimated that there are approximately 90 cooperative stores in Illinois and the adjoining States, and that Illinois has about 75 of these. The Central States Cooperative Society, with offices in Springfield and a warehouse in East St. Louis, Ill., is the wholesale center for this group of cooperative associations. The society was organized in March, 1915, but the wholesale warehouse was not established until early in 1919, the society in the beginning carrying on simply a system of collective buying for its members. Though beginning with a capital of only \$300, the society has grown rapidly and now has a paid-in share capital of \$130,000, and a loan capital of \$25,000. At first the society was hampered by lack of working capital,

¹⁴ National Cooperative News, Chicago, Mar. 6, 1920.

and was compelled to "split profits" with jobbers, thus greatly diminishing its usefulness as a factor in reducing costs. In this district, as in the Seattle district, organized labor has been a strong supporter of the cooperative movement, and has come to the aid of the society with the trade-union funds as loan capital.¹⁵

A membership share in the society costs \$100, and no affiliating individual or organization may hold more than five shares of capital stock. Any amount of loan capital may be advanced. On both share and loan capital the society pays 5 per cent interest.

At the time of the organization of the society every effort was made to induce independent stores to affiliate with the society. Some 35 of the stores in Illinois, having an approximate membership of 200 each, have done so. Most of these handle groceries only, though some carry meats, fuel, boots and shoes, and a limited line of dry goods and millinery. The society also supplies goods to other societies which are not members but are interested, as cooperators, in supporting the wholesale.

Some organization work is done by the society, but only where there is sufficient demand on the part of members of the community to warrant it. This has been done, particularly in "industrial centers where there is a very great demand upon the part of the trade-unions to have a store started, where they have sufficient money to buy goods but do not care to assume responsibility for the organization and management of a store."

The society does not require local associations to fulfill any conditions as to membership or capital before being admitted to affiliation. Where a new association is being organized, however, the society advises that, before starting the store, at least 40 or 50 members who "know each other and can depend on one another to do what is right, be honest, help with the work, be loyal to the store, and do all their trading in their own store," be secured and that each contribute at least \$50 in share capital. Where the store is organized by the society the latter requires the manager to turn in to it weekly reports showing the amount of goods bought, the amount sold, the balance on hand, and the expenses incurred. All branches must make all their purchases through the wholesale society, except in the case of local produce or where the wholesale can not fill an order. The amount of dividend to be returned by each local association to its members is left entirely to the association itself.

It is stated that a number of the affiliated stores do not, in one respect, conform to the Rochdale plan—instead of selling goods at current prices and returning the surplus to their members as dividends, after making certain deductions for education, reserve,

¹⁵ Cooperation, New York City, September, 1919, p. 137.

depreciation, etc., they operate on the "cost plus" plan, under which the goods are sold at cost, plus a small percentage estimated as sufficient to cover expenses.

Tri-State Cooperative Association.

The Tri-State Cooperative Association is both a wholesale and a retail organization, operating on the chain system about 22 retail stores as branches, in western Pennsylvania, eastern Ohio, and northern West Virginia. All of its stores "are owned collectively by the members of all stores; they are managed by the Tri-State board of directors, officers, and central operating force, aided and assisted by local committees." Branches are required to make all their purchases, except those of meats and produce, through the wholesale department, unless the latter is unable to fill the order. Each store is entitled to two delegates to the quarterly meetings of the association, though the by-laws provide that the principle of proportional representation may be applied in the election of delegates. The association states that it sends organizers to establish branches only on request of 10 or more families in a community.

The association issues two kinds of stock—permanent and ordinary—paying 6 per cent interest on the former and 5 per cent on the latter. Ordinary stock may be withdrawn on 90 days' written notice to the board of directors. Every person desiring to join a Tri-State store must pay a membership fee of \$1, and purchase at \$10 a share at least five shares, two of which must be permanent stock.

A store already established may become an "integral part" of the association by accepting Tri-State stock for the value of its net assets. In such cases the rule of the association is that the store have a minimum membership of 100 and a capital of \$5,000. Hitherto the association has not strictly enforced this rule, but it states that it intends to do so in the future. It does, however, require that the stock issued to each member of the store shall be in the same amount—2 shares of permanent and 3 shares of ordinary stock—as is required in stores organized by the association. Such a store may also withdraw at any time "upon majority request of its membership and the signing by all of its members of a release authorizing the transfer of ordinary stock to the local organization."

Independent stores are admitted to membership in the wholesale on the purchase of \$200 worth of permanent stock. There are now over 20 such stores connected with the association on this basis.

The retail department is operated as a unit and a uniform dividend is returned in all of the stores irrespective of their several savings. Employees receive on their salaries a bonus at the same rate as the dividend. Each store participates in the earnings of the wholesale

department in proportion to the amount of its business with the latter.¹⁰

The All-American Farmer-Labor Cooperative Congress.¹

THE All-American Farmer-Labor Cooperative Congress was held in Chicago, February 12 to 14, 1920. It is reported that about 400 delegates were present representing cooperative, farmer, and labor organizations having an estimated membership of over 4,000,000.

The conference, an outgrowth of a similar meeting held in November, 1919² was called to consider means of reducing living costs by a system of direct trading between producer and consumer. Following are some of the subjects on the program for consideration: Direct trading—from producer to consumer; Mobilizing the farmer-labor forces; Cooperative banking and credits; The people's press; Standardization of cooperative business methods; Unification of the cooperative movement; Cooperative education; Social aspects of cooperation; Organized labor and cooperation.

Various speakers outlined the steps that have already been taken toward direct trading and the cooperative supply of necessities. Mr. O. P. Trask told of the action of the Brotherhood of Maintenance of Way Employees which has invested more than a million dollars in factories:

Our 387,000 members are section hands, trackmen, bridge workers. Their work is chiefly out of doors. They need clothes. We have cut their clothing cost 40 per cent by manufacturing and through buying from big manufacturers, who give us 40 per cent discount rather than see us go into the same business. We have mills in Ypsilanti, Kalamazoo, and Toledo making gloves, socks, sweaters, underwear. A shirt factory will be opened soon in Williamston, Mich. Our gloves are of the cheapest cotton or the best Australian wool, running from 17 cents to \$5 in price. One mill turns out 200 union suits a day. A surplus of 100,000 dozen mittens is to be turned over to farmers' cooperatives. A branch supply store is to be opened in Chicago for our 40,000 members there to buy clothes in.³

Reports made at the Congress show the farmers to be strong in support of cooperative enterprises. Mr. C. H. Gustafson, president of the Nebraska Farmers' Union, stated that that society, which owns

¹⁰ It is stated (National Cooperative News, Feb. 7, 1920) that at the annual meeting of the association, Jan. 26, the decision was made to separate the wholesale and retail departments and to apply for a separate charter for the retail department.

¹ Data on which this article is based were obtained from the Farmers' National Council, Washington, D. C.; The Survey, Feb. 21, 1920; the Nebraska Farmer, issues of Feb. 28 and Mar. 6, 1920; The Nation Mar. 6, 1920; and the New Republic, Mar. 10, 1920.

² For a short account of the November Congress, see MONTHLY LABOR REVIEW, February, 1920, pp. 133, 134.

³ The Survey, Feb. 21, 1920, p. 606.

creameries, flour mills, grain elevators, etc., is ready to furnish cooperative stores with the products of its members. Report was also made of the action of the National Federation of Gleaners, a Michigan farmers' fraternal organization, in taking over all the canning factories of Armour & Co. in that State. An account of the successful work of the Farmers' Union of Kansas was given by Mr. W. C. Landson, secretary of the union. He stated that during the 13 years of its existence it has increased its field of operations until it now includes more than 550 incorporated societies—elevators, retail stores, mills, shipping associations, insurance companies, auditing associations—doing a total business during the past 12 months of \$250,000,000. The union is now cooperating with the labor unions. A triple alliance of organized farmers, railroad brotherhoods, and organized labor was formed in the State of Washington last year, according to Mr. Wm. Bouck, master of the Washington State Grange.

The various phases of the work of the consumers' cooperative associations were discussed by Dalton T. Clarke and Carl E. Lunn, president and vice president, respectively, of the National Cooperative Association, and by Mr. Ernest O. F. Ames, president of the Pacific Cooperative League. The need of education in cooperation was urged by Dr. James P. Warbasse, president of the Cooperative League of America. Mr. Isaac Sherman, director of the New York branch of the Moscow Narodny Bank, gave a short account of the cooperative movement in Russia.

In a discussion of cooperative insurance, Mr. E. A. Tyler, of the Equity Cooperative Insurance Co. of St. Paul, spoke of the success of that company, which during its first year wrote \$2,000,000 worth of hail insurance.

The trade-unions of Seattle have been active along various lines of cooperative effort. The building of a labor temple and the establishment of a bank in which every depositor is a stockholder were described by Mr. Frank A. Rust, secretary-manager of the latter institution, the Seattle Trade-Union Bank. That the machinists of the same city have bought one-eighth of the stock in a large national bank and are now organizing a new bank to be located in a building of their own was stated by Mr. W. H. Johnson, president of the International Association of Machinists.

A feature of the convention was the display of cooperatively made goods.

The last day of the conference was devoted to the presentation and discussion of the reports of the various committees. Resolutions were passed indorsing the Rochdale system and favoring the establishment of cooperatively owned newspapers and of a cooperative news service.

A special committee was appointed to formulate plans for direct trading. Recognizing the need for education in cooperation, the congress adopted a resolution providing for organized educational work to be carried on by a department entirely separate from the financial and business department.

Perhaps the most important step was that taken with regard to banking and credit. Recognition was given to the fact that all permanent work along cooperative lines must be based on a system of cooperative credit. In this connection favorable mention was made of the work done by credit unions in the few States where the law permits their formation, and the congress declared itself in favor of legislation furthering cooperative effort. A permanent committee of five, consisting of Mr. Warren S. Stone, grand chief, Brotherhood of Locomotive Engineers, chairman; Mr. George P. Hampton, managing director, Farmers' National Council; Mr. C. H. Gustafson, president, Nebraska Farmers' Union; Mr. Sidney Hillman, Amalgamated Garment Workers; and Mr. F. A. Rust, secretary-manager, Seattle Trade-Union Bank, was appointed. This committee, which will serve without pay, was authorized "to advise upon the incorporation of banks to be established by cooperative labor and farmer organizations throughout the different States" and to take steps to secure necessary cooperative banking and credit union legislation.

It was recommended that a similar congress be held annually hereafter.

National Cooperative Union for Importation of Foodstuffs into Italy.¹

THE present tendency of the Italian Government is gradually to retire from the actual purchase and distribution of food supplies and to delegate questions of detail in this connection to central and local consortiums created for this purpose, while still retaining control over prices and the general policy determining purchases and imports.

In conformity with this tendency, a new autonomous body, under the name of National Cooperative Union for Importation, has been established by a royal decree. This body will provide for the importation of pork products, fats, milk products, and allied foodstuffs in such quantities as may be considered necessary, under the direction and control of the Government. Imports will be effected by means of purchases abroad, which the cooperative union will make either directly or through private firms. The union is authorized to assume the monopoly of receiving, storing, preserving, and eventually manufacturing and delivering these goods. The delivery

¹ Extracted from Commerce Reports, Feb. 12, 1920, pp. 865, 866.

will take place as indicated by the provincial distributing commissioners. The union may also undertake export activities.

The National Cooperative Union for Importation will have its central offices in Rome, with branches and agencies in the other cities of Italy and abroad; it is intended to operate until September 30, 1921, at which time its life may be extended.

Organizations dealing with food supplies, public bodies not instituted for profit, and cooperative companies, their federations and unions, will be admitted as members of the new body. Its initial capital is fixed at 10,000,000 lire (\$1,930,000, par).

Full administrative powers are vested in the board of directors, which will also establish the general principles and conditions on the basis of which purchases are to be made and the storage, manufacture, and preservation are to be carried out. Of the profits of this cooperative union, 20 per cent will be assigned to a reserve fund, and a further sum will be set aside sufficient to pay not more than 5 per cent on the capital invested. Of the amount available after these deductions have been made, 5 per cent will be assigned to the board of directors, 5 per cent to the personnel, and 85 per cent will be turned over to the State, which will distribute it, on the recommendation of the board of directors, to certain national cooperative bodies, with a view to effecting technical improvements in cooperative organizations existing for food supply and consumption.

Activities of the British Cooperative Societies During 1918.¹

THE latest report of the English and Scottish cooperative wholesale societies shows² that the 1,474 societies belonging to the Cooperative Union had a membership, in 1918, of 3,894,999, employed 164,383 persons, and did a business amounting to £248,979,685 (\$1,211,659,637, par).

The table following shows for each class of society the membership, sales, employees, and wages paid in each of the years 1913 to 1918.

¹ For other articles on the same subject see MONTHLY LABOR REVIEW, June, 1919, pp. 121-124; October, 1919, pp. 171-177; January, 1920, pp. 181-183.

VOCATIONAL EDUCATION.

Recent Development of Part-Time or Continuation Schools in the United States.

WHEN the Federal Vocational Education Act became a law on February 23, 1917, only eight States, namely Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Indiana, Wisconsin, and California, had developed systems of vocational education. Under the law three forms of vocational education may exist: All-day schools, part-time schools, and evening classes. Of these three types the part-time schools have perhaps the most direct effect upon industry, as the instruction must be given during hours of employment. While at the time of the passing of the law provision for part-time schools was admittedly desirable and part-time classes conducted for various purposes under various auspices existed here and there, but two of the States, Wisconsin and Pennsylvania, had established compulsory instruction of this character for young workers over 14 years of age.

The increasing interest in vocational training of this character is manifest in the fact that on January 1, 1920, 25 States, most of which had enacted legislation during 1919, had laws requiring attendance upon part-time schools. The following table shows data relative to such schools in these 25 States:

SUMMARY OF PRINCIPAL REQUIREMENTS OF LAWS PROVIDING FOR PART-TIME SCHOOLS, BY STATES.¹

State.	Minimum number of minors required to establish classes.	Ages of required attendance.	Hours per week required attendance.	Length of school year.	Time for holding classes.

^a Every school district of 5,000 population or more.

^b Not specified.

^c Americanization classes only.

^d Every child not attending some other school. Apprentices required to attend vocational school five hours per week for first two years of apprenticeship.

The application of these State laws differs with the varying conditions relative to population, education, and industry, in the different States, and includes numerous details not shown in the table. Among these are the questions of exemption, State aid, substitution of regular day schools or evening classes for part-time classes, the establishment of standards, penalties for violation of the law, and the inclusion of part-time instruction on the employer's time.

The laws of Arizona, Illinois, Massachusetts, Michigan, Missouri, Montana, Nevada, New Mexico, Oregon, Utah, and Washington specifically state that hours of attendance upon part-time or continuation schools must be construed as a part of a minor's lawful employment. In Nebraska, New Jersey, New York, Oklahoma, and West Virginia, the employer is obliged to permit attendance. Illinois makes home work a lawful employment, while the Wisconsin law requires all apprentices to attend a vocational school for at least five hours a week during the first two years of training, for which time they are paid at the regular rate per hour.

States in which the law has been adopted provide penalties for its nonenforcement, applying usually both to the parent or guardian of a delinquent child and to the employer as well. In many cases the minor's employment certificate may be revoked if he fails to attend part-time classes. Sometimes employment ceases when attendance ceases. New York State, in addition to holding the parent and employer responsible, provides for withholding the State public school funds in case of failure to comply with the law. New Hampshire,

Rhode Island, South Dakota, New York, Utah, and California require evening or day Americanization classes for which part-time instruction may be accepted. State and Federal funds in varying amounts may be used to defray the expenses of part-time classes.

Part-time instruction is intended for employed minors over 14 years of age. It may be a trade-extension course which is merely supplemental to the trade or industrial pursuit in which the minor is employed; it may be a preparation for a trade entirely different from the one in which he is earning a living; or it may be of a general character suited to the development of the civic and vocational intelligence of the young worker. In any case these schools and classes must be operated for at least 144 hours every year during the hours of regular employment. The instruction in the trade courses may consist of actual experience in the shop, of theory related to the processes taught, or of both so arranged as to divide the time between the two.

One of the difficulties met in the introduction of these classes is the arrangement of the hours of attendance. While the school is the final judge in this matter the conditions under which minors are employed determine in large measure the adjustment made, a great deal of elasticity being allowed. It has been found that for workers in stores there has been a tendency to divide the time among the working-days of the week, the morning hours from 8 to 10 having been found most suitable and convenient. Manufacturing establishments, on the other hand, often give all the time in a block.

The shift system has also been successfully introduced. Under this system the minors work in two shifts of five hours each, with a 3-hour school period. Such an arrangement insures compliance with the law, secures a full day's production and affords an educational opportunity for children who are compelled to work.

Iowa, which has recently provided for the establishment of compulsory part-time continuation schools, is inaugurating a dull season short course for painters. According to the present plan¹ the State will be divided into six districts with one center in each. The course of instruction will continue for a period of 3 weeks, 8 hours a day for 6 days in each week, making the required 144 hours. At Newton, Iowa, boys being trained as machinists and pattern makers attend the local high school three hours in the morning and work in the machine shops of two plants four hours in the afternoon. In this way they combine instruction in related subjects and practice in the trades under trade conditions. The boys do not in this case receive pay for the work in the shops.

Another difficulty met in the operation of part-time or continuation schools is the lack of properly trained teachers. It is obvious that a

¹ U. S. Federal Board for Vocational Education, Vocational Summary, January, 1920, p. 164.

teacher with an excellent academic training might prove a complete failure in attempting to explain the fundamentals of a trade. The majority of skilled workmen, on the other hand, would be quite as unable to present the theory of certain industrial processes, or even to impart to others a knowledge of the actual operation of the processes. The problem then is to secure as teachers persons who combine with a thorough knowledge of the trade and good personality, ability to express themselves readily. Thus far most of the teachers have been found in the industries themselves. Efforts are being made, however, to give teachers an all-round training for these positions through courses which are being introduced in a number of schools and even in some of the universities of the country.

The need for part-time education is evident from the large number of children who leave school at an early age and drift into industry without any preparation for it or any appreciation of the necessity of preparation. It is estimated that the number² of minors in the United States between 14 and 15 years of age gainfully employed during 1918 was approximately 800,000 boys and 400,000 girls, or more than half of the whole number of children between those ages. Owing to the pressure of keen competition which has increasingly demanded minute specialization upon particular processes rather than general training in a trade, the old apprentice system has almost broken down in some trades and no substitute has as yet been offered for it. As a result industry is faced with an impoverishment of the human factor and with a lack of trained workmen who can be depended upon to secure quality as well as quantity of production. The part-time and other vocational schools, though not designed to take the place of apprenticeship, may supplement this ancient form of trade training where it exists, and in the trades where it is lacking, will undoubtedly serve as a connecting link between the school and the realities of life and labor. To industrial establishments they offer an unexcelled opportunity to develop a trained, intelligent, thinking force, at a relatively small expense.

Vocational Training for Women in Industry.

THE following report on vocational training of women in industry was prepared by a special committee on women in industry of the National Society for Vocational Education, and presented at the joint convention of the National Society for Vocational Education and the Vocational Education Association of the Middle West held in Chicago February 19 to 21, 1920. It is believed that the report is of considerable interest to industrially

² U. S. Federal Board for Vocational Education. Second annual report, 1918, p. 52. Washington, 1919.

employed women as it gives the problems of vocational education for women in industrial fields and suggests means for attaining desired ends.

Report of Committee on Women in Industry.

Every citizen at the end of his or her period of education (all-day school attendance) should be engaged in some form of productive work. The right type of home making is productive work of the highest value to the Nation, but for a great majority of women there is a considerable period between school attendance and home making during which women should engage in some other productive occupation.

The war service of women workers in many types of skilled and unskilled operative and directive work in industry demonstrated beyond further question their ability to assume work calling for a high degree of responsibility and skill. This demonstration of fitness, coupled with the necessity for economic independence for all citizens in a democratic social order, strengthens substantially the claims for the industrial education of women.

Vocational education for trade and industrial occupations for women should be greatly extended, therefore, in order that each individual girl or woman may be assured the opportunity of doing the highest type of productive work of which she is capable during the period previous to marriage, or if she does not marry, for the period of her working life, or for the married woman who, because of widowhood, desertion, childlessness, or some other deviation from normal married life, returns to industry as a wage earner.

Nothing less than a recognition of these problems which confront women wage earners, and serious constructive education to meet them, can insure the best type of womanhood and integrity of workmanship among woman workers.

Vocational education for girls and women is a twofold problem: (a) Preparation for wage earning, and (b) preparation for home making. This discussion, however, is confined to the problems of vocational education for wage-earning occupations in industrial fields.

Facts Relative to and Problems of Industrial Education for Girls and Women.

1. Woman wage earners now constitute an important factor in industry and the number is increasing both absolutely and relatively.

1900: 5,319,397—18.8 per cent of the women over 10 years of age were wage earners.

1910: 8,075,772—23.4 per cent of the women over 10 years of age were wage earners.

1919: It was estimated that 11,000,000 of the women over 10 years of age were wage earners.

2. Industries employing woman workers represent a wide diversity of industrial employments. The United States Census of 1910 (Vol. IV, p. 53) lists woman workers in every one of the 127 types of employment except locomotive firemen and engineers; plumbers, gas and steam fitters; railroad brakemen and conductors; teamsters; laborers (road and street building); draymen and expressmen; motormen; policemen; sailors and marines. The census of 1920 will reduce this list of exceptions.

3. Women of all ages are wage earners. (United States Census, Vol. IV., p. 69:)

Age group.	Number of women at work.	Per cent of women at work.	Proportion of women at work.
10 to 13 years.....	286,946	8.0	1 out of every 12
14 to 15 years.....	350,140	19.8	1 out of every 5
15 to 20 years.....	1,847,600	39.9	2 out of every 5
21 to 44 years.....	4,302,969	26.3	1 out of every 4
45 years and over.....	1,288,117	13.7	1 out of every 7

4. The largest age group of woman workers is 14 to 24 years; 24 is generally conceded as the usual age for marriage.

5. Because of the immaturity, and in many cases the home residence, of a considerable proportion of this 14 to 24 year group, self-supporting women living away from home and older women responsible for family support are frequently forced to accept wages insufficient to provide a safe standard of living or to insure protection in case of illness or old age. Woman wage earners are entitled to the financial consideration of their needs as workers and as citizens.

6. Specialized machines and scientific organization have created two main types of industrial occupations: (a) The operative type, in which the worker performs one or more special operations or processes; and (b) the directive type, in which a foreman or forewoman directs the organization of the factory.

7. Many industries in which young women are employed are organized on a basis of extreme specialization or subdivision of work in which no traditions of apprenticeship exist and in which shifting from one specialized operation to another is difficult. Because of this condition many woman workers remain excessively long on operative specialties which can be learned in comparatively short periods of time, when their increasing maturity, experience, and training should assure them of advancement to better paid specialties or to directive or more expert work,

8. Woman workers (not the individual woman) are now regarded as a permanent factor in industry and not as an emergency labor reserve. Education for industrial occupations, therefore, demands due consideration in a program of vocational education for women which recognizes preparation for wage earning as well as preparation for home making.

9. The stigma which social prejudice has placed upon industrial work for women has militated strongly against the development of industrial education for girls and women. This applies to industrial occupations in which women have long been employed as well as to newer types of work developed under the modern factory system.

10. Woman workers since the advent of the factory system have been exploited workers. Because of the prejudice against industrial work, the lack of apprenticeship systems of training, and the slow development of other forms of trade organization among women, woman workers have been largely untrained for their work and uninformed about conditions of their labor and the value of that labor.

Protective legislation alleviates these conditions and it necessarily antedates consideration of vocational education, but education, both general and vocational, must ultimately develop in women the ability to formulate and demand for themselves the protection and privileges necessary for successful and satisfactory employment.

11. Under the terms of the Federal Vocational Act equal opportunity is possible for girls and women as for boys and men. That States and local communities have not taken advantage of available resources is evident from the third annual report of the Federal Board for Vocational Education, which shows that only the smallest beginnings have been made in the establishment of systematic vocational education for girls and women in industrial fields (Vol. I, Table 18, p. 220).

Number of female pupils enrolled in trade or industrial schools in the United States for year ending June 30, 1919.

Evening schools.....	1, 391
Part-time schools.....	5, 340
All-day schools.....	2, 058
Manhattan Trade School ¹	1, 495
	3, 553

¹ Omitted in Federal Board report.

The complexity of the social, economic, and educational problems of vocational education is recognized, but the nature of the problem should insure open-minded study and experimentation in developing and putting into effect an adequate program for industrial education for girls and women commensurate with the importance of the problem. State boards and the Federal Board for Vocational Education share this responsibility.

12. The States are charged with the responsibility of selecting and training supervisors and teachers for the vocational work of the State. The supply of women for State and city supervisory positions and for teaching positions in the vocational schools is far below the demand. Lack of supervisors and teachers, in turn, retards the development of vocational schools and desirable courses and standards of instruction.

Solutions of these Problems.

1. While in protective legislation, organization of workers, and education of employers and consumers are to be found some remedies for difficulties encountered by girls and women in industry, the remedy of most importance is better general education and better vocational education for those who compose the army of girl and woman workers.

2. A considerable part of both these forms of education should be assured prior to the beginning of wage-earning work, but much of it can only be given parallel to the pursuit of such work or during periods when the worker shall voluntarily or involuntarily discontinue wage earning.

3. One fundamental aim of both general and vocational education should be to give girls an understanding of the conditions of wage-earning work, and the possibilities available for the protection of health, morals, earning capacity and promotion to higher levels of employment.

4. The fundamental aim of vocational education should be to fit the worker to pursue effectively some specialized work, to assure advantageous entrance to a wage-earning occupation, and to make it clear that employment in one phase of specialized work is but one stage from which she should advance as experience, maturity, and additional training justify advancement.

5. One of the primary aims of up-grading vocational education should be to fit the worker for promotion to more advanced stages of operative work, or for directive work, or positions of leadership.

6. An important aim of vocational education at the later stages should be to fit women, who expect to remain in wage-earning work and those who return to wage earning when their children have passed beyond the need of mother care, for productive work in occupations which demand maturity, experience, and special training. This should be done in order that these women may not be brought into sharp competition with every young woman worker, no matter what may have been the special training of the latter.

7. Educators, employers, and others interested in or responsible for the education of wage-earning girls and women must recognize the weight of social prejudice against industrial occupations and actively engage in the dissemination of intelligent information which shall bring about a realignment of attitudes among employers, workers, and the community at large toward women in industrial callings and develop a demand for education and vocational training which shall result in knowledge of the job, and group consciousness and working integrity among woman workers. This task is urgent, and necessarily a part of the working program, for the development of all-day, part-time, and evening courses for girls and women of all ages and grades of experience depends largely upon a measure of social approval.

8. The States and local communities look to the Federal Board for Vocational Education for help in the development of a constructive program of vocational educa-

tion for industrial occupations for women, which includes ways and means for developing a demand for industrial education as well as courses of study, and dynamic assistance in putting it into operation. This help should be commensurate with the numbers of workers involved and their rights as workers and citizens.

To Attain these Ends.

1. General education for all girls (and boys) extending over at least the first 8 or 10 years of school attendance should be insisted upon in order that intelligent, right-minded participation in home and community life and State and national activities may be assured.

2. Vocational education for all prospective workers should be assured in all-day vocational courses before entering wage earning or in part-time courses which supplement occupational experience and prepare for promotion. While the all-day vocational school or department in most communities serves fewer students than part-time and evening courses, it has been shown that the all-day courses tend to lengthen the school attendance of girls contemplating wage earning and that vocational preparation tends to create a demand for further trade training and education in part-time or evening trade extension courses.

3. Vocational education supplementing the daily occupation, particularly part-time day courses, should be assured to 16 or 18 years of age. Special effort should be made to develop these courses in places of employment when instruction can be given more effectively and advantageously (without loss of time, suitable equipment, illustrative material, subject matter for daily lessons) in the business establishment than in the school building. Instruction that carries its point—that proves its worth in the daily employment—increases the demand for education both general and vocational. Passive approval of this form of education will not bring results. Part-time vocational education is pioneer education and to insure its success it requires vigorous propaganda on the part of educational leaders and genuine belief in it, as well as good teaching on the part of the teachers who undertake the work.

4. Since stimulation, promotion, and development of vocational education is of paramount importance in the ever-widening horizon of women's employment, a staff of workers commensurate with the importance of the problem should be provided by both the State and Federal authorities. Each of the regional fields should have a woman agent for industrial education charged with the duties of stimulating and developing courses for the provisions for teacher-training courses and all-day, part-time, and evening vocational courses for which Federal funds of the Smith-Hughes Act provide.

Each State should have a woman in charge of industrial education for girls and women charged with the duty of stimulating and developing the work within the State as outlined by the State board and approved by the Federal Board for Vocational Education.

5. It is of utmost importance that each State make definite provisions for teacher-training courses for State supervisors and teachers for the vocational schools of the State. So long as State and national programs of vocational education depend upon stimulation for their ultimate acceptance and effective operation, definite and sustained effort should be made to attract well-educated, well-trained women as well as men into the field of vocational education.

COLLECTIVE BARGAINING.

New Agreement Affecting the Men's Clothing Industry in Chicago.

A NEW agreement granting increases in wages to piece and time workers in the men's clothing industry in Chicago has been entered into, effective December 15, 1919, by the Amalgamated Clothing Workers of America and Chicago clothing manufacturers. The considerations that figured in the final adjustment, as presented by the employees, were as follows:

1. Increased cost of living.
2. Desire for improvement in standards of living, if the industry can afford it.
3. The great demand for labor in this industry, which would have permitted greatly increased wages by bargains made by individual workers, had not the agreement stabilized and moderated rates of wages.
4. The increased market value which labor in this industry now commands, as shown by increases in wages in other cities.
5. The efficiency of this industry in maintaining constant production, thereby making its important contribution to public welfare, both in the economic aspect of doing its share toward keeping costs down as compared with the wastefulness of strikes, and in the general social and public aspect of maintaining order and peace in industry in the midst of a generally disturbed condition in the labor world.
6. The efficiency of the Chicago market, in particular, as a piecework market, which makes it possible for the Chicago market to do at least as well by the workers as other less efficient markets, and makes any other attitude hard to justify.

Against any increase at this time it was maintained by the representatives of the firms:

1. That increases in wages in the industry have more than kept pace with increased cost of living.
2. That whatever may be true as to the demand for labor and the consequent market rate of wages, there is at this time a paramount duty to the public not to increase the cost of the necessities of life unless there is a real exigency, which in this case does not exist.
3. That this industry is now in a highly favorable condition, as compared with other industries, both national and local, especially when it is considered that only about one-third of those employed are heads of families.
4. That since deflation is bound to come sooner or later, every increase which adds to costs has a tendency in the wrong direction, and will make the inevitable shrinkage more keenly felt.
5. That the indirect effects on prices and industry of any increase in wages at this time ought to be considered.
6. That local conditions in the Chicago market, both within the industry and in the relation of this to other industries, make any change undesirable from the point of view of the best interests of the agreement into which many of the firms have recently entered.

After considering and weighing these and other arguments presented the board of arbitration, to which under existing agreement the question of changes in wage rates was automatically referred, issued the following award:

Beginning December 15, 1919, an increase shall be added to the piece and wage rates now in existence under the agreements, in the shops of the firms and their contractors. The new rates thus established shall prevail up to June 1, 1920, except when detailed changes may be ordered by the board of arbitration on recommendation of either of the trade boards.

The increase shall be applied as follows:

An increase of twenty per cent (20%) shall be given to sections or occupations, where the average earnings or wages on a forty-four hour basis are \$30 or less per week, and five per cent (5%) to sections where the average earnings on a forty-four hour basis are \$50 or more per week. An increase equivalent to \$6 per week shall be given to sections where the average earnings are from \$30 to \$49.99 per week.

An increase of 20 per cent shall be given to all week workers now receiving less than \$30 per week; an increase of \$6 per week to week workers now receiving from \$30 to \$49.99 per week; and an increase of 5 per cent to week workers now receiving \$50 or more per week.

In piecework sections, the equivalent of the increase shall be calculated and added to the existing piece rates.

In addition to the increases granted above, the board will grant further increases in specific sections to be recommended by the committee appointed to investigate the subject of relative disparities in rates now existing.

The increase shall apply to all sections and classes of labor represented by the Amalgamated Clothing Workers of America, provided that nothing in this shall be taken to prejudice certain problems of reclassification which are now pending before the board of arbitration under the Hart, Schaffner & Marx agreement. Pending the completion of such reclassification, and a final decision, such persons as were granted increases by the board under the agreement of July 8 shall be presumed to be entitled to the increases herein provided.

Inexperienced persons employed in the trade less than three months at week work shall not be included in the award.

Persons who are working on piece-rate operations on a weekly minimum guaranty shall be considered pieceworkers and not week workers.

In calculating the classifications of piecework sections for the purpose of applying these increases, the same methods and practices shall be employed as in the adjustment of July, 1919.

The board hereby authorizes the establishment of commissions, under the chairmanship of Dr. Millis and Mr. Mullenbach, with representation of employers and workers, respectively, selected by themselves, to elaborate and recommend to the board standards of wages and production, and classifications of week workers. The chairmen shall have the deciding votes in cases of disagreement, and such recommended standards and classifications, when approved by the board, shall become a part of this award.

EMPLOYMENT AND UNEMPLOYMENT.

Employment in Selected Industries in February, 1920.

THE Bureau of Labor Statistics received and tabulated reports concerning the volume of employment in February, 1920, from representative establishments in 13 manufacturing industries. Comparing the figures of February, 1920, with those of identical establishments for February, 1919, it appears that in 11 industries there was an increase in the number of persons employed, while in 2 there was a decrease. The largest increase, 124.9 per cent, is shown in woolen, while cotton finishing and men's ready-made clothing show percentage increases of 52.3 and 50.2, respectively. Decreases of 15.9 per cent in car building and repairing and 9.7 per cent in cigar manufacturing are shown.

Twelve of the 13 industries show an increase in the total amount of the pay roll for February, 1920, as compared with February, 1919, and 1 shows a decrease. The most important percentage increases, 252.4 and 137.9, appear in woolen and men's ready-made clothing. The next largest increases are 96.9 per cent in cotton finishing, 65.9 per cent in silk, and 65.6 per cent in cotton manufacturing. A decrease of 13.3 per cent is shown in car building and repairing.

The increases in the volume of employment over last year are largely due to labor troubles and the cancellation of Government contracts in January, 1919, which decreased employment and production in February, 1919.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN FEBRUARY, 1919, AND FEBRUARY, 1920.

Industry.	Estab-lish-ments reporting for February, both years.	Period of pay roll.	Number on pay roll.			Amount of pay roll.		
			February, 1919.	February, 1920.	Per cent of increase (+) or decrease (-).	February, 1919.	February, 1920.	Per cent of increase (+) or decrease (-).
Automobile manufacturing...	37	1 week...	89,846	126,149	+ 40.4	\$2,591,511	\$4,065,361	+ 56.9
Boots and shoes.....	69	do.....	58,738	63,760	+ 8.5	1,177,502	1,462,796	+ 24.2
Car building and repairing...	50	1 month.	62,279	52,373	- 15.9	3,544,944	3,072,663	- 13.3
Cigar manufacturing.....	55	1 week...	18,363	16,581	- 9.7	286,980	331,662	+ 15.6
Clothing, men's ready-made..	45	do.....	19,117	28,710	+ 50.2	401,517	955,048	+137.9
Cotton finishing.....	16	do.....	8,394	12,787	+ 52.3	145,676	286,824	+ 96.9
Cotton manufacturing.....	57	do.....	50,115	57,374	+ 14.5	709,971	1,175,401	+ 65.6
Hosiery and underwear.....	62	do.....	28,559	32,344	+ 13.3	402,594	593,178	+ 47.3
Iron and steel.....	93	1 month.	147,521	149,904	+ 1.6	10,043,797	11,073,588	+ 10.3
Leather manufacturing.....	33	1 week...	16,448	18,444	+ 12.1	365,081	479,031	+ 31.2
Paper making.....	57	do.....	31,126	32,440	+ 4.3	646,732	837,179	+ 29.4
Silk.....	50	2 weeks...	17,667	21,279	+ 20.4	594,993	987,223	+ 65.9
Woolen.....	47	1 week...	18,252	41,042	+124.9	291,152	1,026,052	+252.4

Comparative data for February, 1920, and January, 1920, appear in the following table. The figures show that in 3 industries there was an increase in the number of persons on the pay roll in February as compared with January and in 10 industries a decrease. Several factors contributed to produce a decrease in employment in February. The most important were seasonal reductions, the tie-up of transportation during the first part of the month on account of snowstorms, lack of raw material, and much sickness among employees during the influenza epidemic. The increases in the number of persons employed are 1.7 per cent in automobile manufacturing, 1.6 per cent in men's ready-made clothing, and 1.6 per cent in iron and steel. The greatest decrease—4.5 per cent—is shown in cigar manufacturing.

In comparing February with January, 2 industries show an increase in the amount of money paid to employees, while 11 show a decrease. The increases are 5.9 per cent in iron and steel and 2.2 per cent in silk; the largest decreases—10.4, 7.9, and 6.7 per cent—are shown in cotton finishing, cigar manufacturing, and boots and shoes.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN JANUARY AND FEBRUARY, 1920.

Industry.	Estab- lish- ments report- ing for Janu- ary and Febru- ary.	Period of pay roll.	Number on pay roll.			Amount of pay roll.		
			Janu- ary, 1920.	Febru- ary, 1920.	Per cent of in- crease (+) or de- crease (-).	January, 1920.	February, 1920.	Per cent of in- crease (+) or de- crease (-).
Automobile manufacturing...	38	1 week..	114,565	116,534	+1.7	\$3,818,650	\$3,726,551	- 2.4
Boots and shoes.....	68	do.....	63,792	62,791	-1.6	1,540,661	1,438,081	- 6.7
Car building and repairing....	49	½ month.	47,195	47,020	- .4	2,853,315	2,772,315	- 2.8
Cigar manufacturing.....	55	1 week..	17,522	16,732	-4.5	364,246	335,608	- 7.9
Clothing, men's ready-made..	48	do.....	28,372	28,838	+1.6	996,048	990,785	- 3.5
Cotton finishing.....	16	do.....	13,123	12,787	-2.6	320,070	286,824	-10.4
Cotton manufacturing.....	53	do.....	46,248	45,132	-2.4	966,617	927,479	- 4.0
Hosiery and underwear.....	61	do.....	32,295	31,993	- .9	614,905	587,952	- 4.4
Iron and steel.....	86	½ month.	141,787	147,151	+1.6	10,298,643	10,992,358	+ 5.9
Leather manufacturing.....	32	1 week..	18,497	17,959	-2.9	478,525	465,833	- 2.7
Paper making.....	55	do.....	31,990	31,781	- .7	821,961	818,942	- .4
Silk.....	50	2 weeks..	21,337	21,279	- .3	965,692	987,223	+ 2.2
Woolen.....	47	1 week..	41,376	40,767	-1.5	1,076,118	1,042,123	- 3.2

In addition to the data presented in the above tables as to the number of employees on the pay roll, 80 plants in the iron and steel industry reported 120,388 employees as actually working on the last full day of the pay period reported for February, 1920, as against 120,262 for the reported pay-roll period in February, 1919, an increase of 0.1 per cent. Figures given by 77 establishments in the iron and steel industry for February, 1920, and January, 1920, show that 119,171 employees were actually working on the last full day of the pay period reported for in February, 1920, as against 120,693 for the period in January, 1920, a decrease of 1.3 per cent.

Changes in Wage Rates.

DURING the period January 15 to February 15, 1920, in 10 of the 11 industries which reported changes in wage rates, only increases were reported; in 1 industry 1 establishment reported a decrease. Two establishments reported no change. Of the establishments reporting, many did not answer the inquiry relative to this item, but in such cases it is not likely that changes were made.

Automobile manufacturing: Two establishments reported an increase of 2 per cent, affecting 40.4 per cent of the force in one plant and 4 per cent of the employees in the other concern. One firm granted an increase of 8 per cent to 11.8 per cent of the men, and $4\frac{1}{4}$ per cent of the workers in one factory were given a 4 per cent increase.

Boots and shoes: Two establishments gave a 25 per cent increase, affecting 50 per cent of the employees in one plant and 40 per cent of the men in the other concern. About 32 per cent of the force in one firm were granted an increase of 22 per cent. A 15 per cent increase, affecting 15 per cent of the employees, was reported by one plant. One establishment gave a 10 per cent increase to 35 per cent of the force while another factory reported an increase of about 10 per cent, affecting 4 per cent of the force. One concern granted 5 per cent of the men a 6 per cent increase. One firm reported an increase but made no further statement. The 10 per cent bonus was discontinued by one firm.

Cigar manufacturing: A 14 per cent increase, affecting 90 per cent of the employees, was given by one firm. All the force in one concern received a 10 per cent increase, while 90 per cent of the men in another factory were given a wage rate increase of approximately 10 per cent. One establishment reported a $7\frac{1}{2}$ per cent increase, affecting 85 per cent of the employees.

Men's ready-made clothing: All of the employees in one establishment received a 10 per cent increase.

Cotton finishing: One firm reported a 14 per cent increase, affecting 9 per cent of the employees.

Cotton manufacturing: All the employees in two plants received a wage rate increase of 10 per cent, while another firm granted an increase of approximately 10 per cent to the entire force. One establishment gave a 7 per cent increase to all the men and one factory reported an increase of about $3\frac{1}{2}$ per cent, affecting all of the force.

Hosiery and underwear: One establishment reported an average increase of about 13.2 per cent to about 8 per cent of the employees. All of the employees in one firm received a wage rate increase of $12\frac{1}{2}$ per cent. Three concerns granted a 10 per cent increase, affecting all of the force in two factories and 25 per cent of the men in the third establishment. Twenty per cent of the employees in one mill were granted an increase of approximately 8 per cent.

Iron and steel: All of the employees in one plant received an increase of 14 per cent. Twenty-nine establishments granted a 10 per cent increase; in 11 of these all employees were affected; in 8, practically all; in 1, 90 per cent; in another, 75 per cent; in 2, 66 $\frac{2}{3}$ per cent; and in the remaining 6, 65 per cent, 60 per cent, about 60 per cent, 50 per cent, 3 per cent, and all the day men, respectively. An increase of approximately 10 per cent was reported by three mills, affecting all the employees in one concern, about 96 per cent of the force in the second firm, and 90 per cent of the men in the third establishment. Another plant reported a 10 per cent increase but made no further statement. One plant changed the bonus from 55 to 65 per cent. One concern granted increases ranging from 7 to 10 per cent, to 70 per cent of the employees. All of the employees in one establishment were given an increase of 9 $\frac{1}{2}$ per cent, while all the men in another mill were granted a 9 per cent increase. An increase of 8.9 per cent, affecting 90.3 per cent of the force, was reported by one concern. Three establishments gave an 8 per cent increase, affecting all the men in two concerns, and 50 per cent of the employees in the third mill. All of the force in one plant were given an increase of 6.9 per cent, and the entire force of another firm were granted a 5 per cent increase. Six firms reported an increase of 2.3 per cent but made no further statement. An increase of 2 per cent, affecting 10.8 per cent of the employees, was reported by one plant.

Leather manufacturing: One establishment gave an increase of 15 per cent to 25 per cent of the employees, and one-third of the men in another plant received a 11 $\frac{1}{2}$ per cent increase. Practically all the men in one concern were given an increase of approximately 7 $\frac{1}{2}$ per cent.

Paper making: One establishment gave a 10 per cent increase to all of the employees and another firm reported an increase of 10 per cent but failed to state the number of persons affected. Two mills granted an increase of approximately 10 per cent, affecting all the employees in one plant and 75 per cent of the force in the other. One concern gave increases ranging from 4 to 10 per cent to the entire force. An increase of 8 per cent, affecting 13.4 per cent of the men, was reported by one mill. Approximately 40 per cent of the employees in another establishment received an increase of 6 per cent, while 17.7 per cent of the employees in another plant received an increase of 5.8 per cent. One concern reported an increase to all the force but did not state the amount of the increase, while another plant reported a general advance in wages but made no further statement.

Silk: An increase of 20 per cent, affecting 50 per cent of the employees, was reported by one concern, while the entire force in

one establishment received an increase of about 17 per cent, and about 79 per cent of the employees in another mill were granted a 15 per cent increase. An increase of $12\frac{1}{2}$ per cent, affecting about 9 per cent of the men, was reported by one firm, while another concern gave a 12 per cent increase to 30 per cent of the force. Five establishments reported a 10 per cent increase, affecting all of the employees in two mills, 60 per cent of the men in another plant, 50 per cent of the employees of the fourth firm, and 20 per cent of the force in the fifth concern. Ninety per cent of the force in one establishment were given a wage increase of about 10 per cent. One concern reported an increase of 8 per cent, affecting 40 per cent of the employees, while another plant reported a 6 per cent increase, affecting 45 per cent of the employees. Twenty per cent of the men in one mill were given a 5 per cent increase. All of the men in one mill received an increase of \$2 a week and all the women an increase of \$1 a week. One establishment gave the weavers, or about 60 per cent of the force, an increase of 5 cents per hour.

Finding Employment for Disabled Civilians in the United States.

By GERTRUDE R. STEIN.¹

THE Institute for Crippled and Disabled Men, 101 East Twenty-third Street, New York City, formerly the Red Cross Institute, has recently compiled tables to show what jobs men with certain disabilities have secured through its bureau. Most of the claims made as to the working ability of crippled men have been speculative. The institute now has records of about 2,200 cases of men and boys suffering from orthopedic difficulties. There is a great deal of statistical information in these records which might be of use to others undertaking work with disabled civilians. The institute is anxious to make these facts of use to any organization interested, and welcomes inquiries.

The institute secured 1,800 positions for crippled men and boys during its first two years. It does not maintain a general bureau for the handicapped, but studies opportunities for orthopedic cases only. The institute realized early in its history that the orthopedic cases were only a small part of the general problem. It felt, however, that in as technical and experimental a subject as this it was better to try to do a small job thoroughly rather than to attempt to cover the whole field superficially.

¹ Employment secretary, Institute for Crippled and Disabled Men.

When the institute started its employment bureau the secretaries found difficulty in persuading employers to take disabled men. The whole idea of having crippled workmen was a new one to many. Even some of the workmen were surprised that the world expected them to "carry on" again. Applicants came to the bureau who had not worked in 10 or 15 years. Their friends and relatives had treated them as though there was no possibility of their ever again being among the employed. It has been very gratifying, as the bureau has progressed, to see the increasing variety of positions open to the handicapped, and the increasing number of cripples who have started out for a second time on their industrial careers.

In placement work for the handicapped it is difficult to lay down rules. For one cripple it is essential that he get work near home. He may secure congenial and a very good paying position, but if it is necessary for him to travel by subway he will be irregular and unpunctual. A man with spinal trouble frequently can stand or sit at work, but these postures must be varied. If he keeps in one position for any length of time the pain becomes excessive. Another man is so foreign that he can not work in a factory where the foreman is not of his nationality. There are many other complicating circumstances, such as hours, sanitary conditions, wages, etc. In placing cripples we have all the difficulties of the placement of the normal man plus many others.

The fact that the institute has placed 1,800 men is not so encouraging as it appears. There are many errors in these placements. Some of these men would have received more satisfactory positions if the secretaries had possessed the information they have since obtained. We are only in the very beginning of this science of rehabilitation. We have much to learn, and, unfortunately for those with whom we work, we have to learn through our errors.

One result of this survey is the discovery of how few men with arm amputations (only 165) have been placed. Many of these placements have unfortunately not been constructive. This has certainly been the hardest task the institute has had before it. A one-armed man can not place himself without almost superhuman effort. Although the institute bureau has concentrated its greatest efforts on this problem of the arm case the results have not been large. A few very constructive placements however, were made, such as those of painter, welder, insurance investigator, milling machine tender, electrical engineer, nickel plater, etc. The bureau is always on the search for jobs for which men with arm disabilities can be trained.

Reabsorption of Labor and Unemployment in the United Kingdom.¹

Compiled by N. C. ADAMS.

THE total number of men demobilized from the forces in the United Kingdom as of February 18, 1920, was 4,187,709, of which number 197,713 were officers and 3,989,996 were of other ranks. On the same date 102,147 women had been demobilized from the several women's auxiliary branches of the service. Presumably all women in these branches of the service will be demobilized, in which case some 5,000 are yet to be released.

TABLE 1.—DEMOBILIZATION OF HIS MAJESTY'S FORCES, BY SERVICE AND RANK, UP TO FEBRUARY 18, 1920.

Other ranks.....	4, 469, 024	2, 725, 819	3, 989, 996

¹ Plus subsequent additions.
² Original expectations.

³ In addition about 150,000 are still to be demobilized.

There was a continuous week-to-week reduction in unemployment in the United Kingdom from the beginning of May, 1919, up to the last of September, when the railway strike took place and the long-drawn-out molders' strike began.

The total number of persons on the live registers of employment exchanges April 25, 1919, was 1,257,160, which number had decreased to 530,336 on September 19, but up to the end of January, 1920, the total had not again been so low, while twice during the period the weekly live register totals exceeded 600,000. Following the molders' strike settlement, January 22, 1920, the week-to-week reduction was resumed, and February 6, 1920, the September 19, 1919, total was lowered for the first time. On February 13 the total had fallen below a half million, the figures being 493,273.²

¹ Unless otherwise indicated, the figures used in this article are copied from the weekly reports on demobilization and resettlement prepared under the direction of the Controller of Statistics of the British Ministry of Labor.

For previous reports see MONTHLY LABOR REVIEW for May, 1919, pp. 85 to 100, and September, 1919, pp. 135 to 161.

² On Mar. 5, 1920, the total had fallen to 425,157.

To illustrate the amount of unemployment caused by the iron molding and core making trades' strike the Weekly Report for November 25, 1919, says: "After more than nine weeks' duration the number on strike is between 40,000 and 50,000. The number of men and boys with policies lodged in shipbuilding, engineering, and iron and steel trades is 118,794, or an increase of nearly 50,000 over the figures of September 19, the donation week preceding the strike." This strike was settled on January 22, 1920, and work was resumed four days later. The strike had lasted more than four months, and it is estimated that at some time during that period 100,000 in allied trades were thrown out of employment, in addition to the 50,000 on strike.³

The out-of-work donation scheme under which benefits were payable to those demobilized from the forces for a period of 26 weeks was, in May, 1919, extended for a second period of 26 weeks, and, again, in November, 1919, a further extension was made under modified terms for the period ending March 31, 1920.⁴

The highest point in civilian unemployment was reached on March 7, 1919, when 790,519 policies were lodged. From that date the number rapidly fell to 100,730 on September 26, and the reduction would doubtless have continued but for the combined effect of the railway strike and the iron molders' dispute. The scrutiny by employment committees had resulted in the refusal of 40,700 original civilian policies, 70,400 extended policies to November 21, nearly 70 per cent of these refusals being in respect of women. It should also be noted that more than 53,000 men and women had exhausted the full extended period of donation.

Reabsorption—His Majesty's Forces.

THE resettlement reports of the Ministry of Labor are now presenting reabsorption statistics for ex-service men on the basis of the difference between the number demobilized whose furlough has expired and the number drawing unemployment benefit. "This method gives a more accurate figure than the method formerly used⁵ but is still an understatement of reabsorption in view of the fact that the men discharged prior to the armistice who have been issued with His Majesty's Forces policies are omitted from the total available for donation, their number being at present not ascertainable, though policies lodged by such men are included." The reabsorption of women is still calculated only for those women to whom policies have been issued, a number less than 20 per cent of the total demobi-

³ The molders finally accepted a 5s. (\$1.22, par) increase in place of the 15s. (\$3.65, par) demanded, on the understanding that a joint inquiry into working conditions of the trade would be held forthwith.

⁴ See MONTHLY LABOR REVIEW, February, 1920, pp. 228, 229.

⁵ See MONTHLY LABOR REVIEW, September, 1919, pp. 136-138.

lized. A large proportion of the remaining 80 per cent either are not customarily employed or are trained workers such as nurses, motor drivers, etc., who have little or no difficulty in placing themselves.

The original plan to demobilize by industries and in accordance with industrial needs was not strictly followed, and after September 30 the publication of the analysis of the dispersal certificates by industrial groups was discontinued, as it was found by investigation to be unsafe to assume that all demobilized men had returned to the industries in which they were grouped under the army classification.

Table 2 shows the progress of the reabsorption in industry of demobilized members of the Forces, both men and women. It will be seen that only 8.9 per cent of the demobilized men whose furlough had expired were without employment February 6, 1920, while 21.9 per cent of the demobilized women to whom policies had been issued were still unemployed.

TABLE 2.—PROGRESS OF REABSORPTION OF HIS MAJESTY'S FORCES INTO INDUSTRY.

Date.	Demobilized men.						Total.

Reabsorption—Civilians.

TABLE 3 shows for civilians the cumulative number of policies issued, the number remaining lodged at specific dates, and the number of unemployed persons reabsorbed into industry as indicated by the difference between policies issued and policies lodged at a given date.

The publication of these statistics was not resumed after the interruption caused by the strikes which focused in September, at which time 95 per cent of the unemployed civilians had been reabsorbed into industry.

According to the final published report 1,983,793, or 95 per cent of all unemployed civilians in Great Britain to whom unemployment donation policies had been issued from November 25, 1918, to September 12, 1919, had been reabsorbed into industry. Of this number 675,599 were men, 1,081,973 were women, 119,073 were boys, and 107,148 were girls. The highest percentage of unemployment was among men -8.5 per cent; among women, boys, and girls, 2.9, 2.6, and 2.1 per cent, respectively, were unemployed. During the period policies had been issued to 738,350 men, 1,114,514 women, 122,367 boys, and 109,445 girls—a total of 2,084,676.

The out-of-work donation scheme for civilian workers terminated on November 24; therefore the last full week for which figures for civilian out-of-work donation policies published is the week ending November 22.

At that date of the 137,637 civilians who were on donation 72,137 were in insured occupations, and of these latter about 70,000⁶ claimed unemployment insurance on the 28th of November. The total number of civilians claiming unemployment insurance on November 28, 1919, was 102,684.

The number of unemployment books remaining lodged under the 1911 and 1916 national insurance (unemployment) acts is shown by industries in Table 4, from the week following the termination of the out-of-work donation scheme to February 20, 1920.

The effect of the iron molders' strike is easily traced in this table in the steady increase of the figure for males in engineering and allied trades. When the strike terminated (Jan. 22, 1920) nearly 60 per cent more books were lodged for males (total, all insured trades) than at the end of November, while in the same period the number of women's books lodged had decreased over 15 per cent. Four weeks after the termination of the strike the number of men's books had decreased over 30 per cent, showing the very rapid resumption of employment. In the engineering and iron-founding trades alone (males) the decrease in unemployment was over 40 per cent. These figures, of course, relate to civilians only. The effect of this strike and its settlement upon ex-service men's unemployment is shown on pages 166 to 169.

⁶ These had already been insured under unemployment insurance acts of previous years. A new bill to establish general compulsory unemployment insurance was introduced in Parliament by the Minister of Labor on February 16, 1920.

TABLE 4.—NUMBER OF UNEMPLOYMENT BOOKS REMAINING LODGED AT ALL LOCAL OFFICES UNDER THE 1911 AND 1916 NATIONAL INSURANCE (UNEMPLOYMENT) ACTS.

Action of Employment Committees with Regard to Civilian Policies.

THE week ending November 28 was also the last week for which there are reports of action taken on civilian out-of-work policies by employment committees, juvenile employment committees, and port labor committees. The total original applications (civilians only) dealt with to November 22 was 377,365, of which 10.8 per cent had been refused; and the total applications for extended donation (civilians only) was 154,412, of which 12.2 per cent had been refused. Table 5 shows the work of the committees specified for the last week that out-of-work donations were paid.

TABLE 5.—ACTION TAKEN ON CIVILIAN POLICIES BY EMPLOYMENT COMMITTEES, JUVENILE EMPLOYMENT COMMITTEES, AND PORT LABOR COMMITTEES FOR WEEK ENDING NOV. 22, 1919.

Item.	Men.	Boys.	Women.	Girls.	Total.
Applications for original policies:

Other grounds.....	13,257	5.0
Total.....	268,589	100.0

Up to February 14, 1920, prosecutions for alleged fraud in connection with out-of-work donation had resulted as follows: Out of 1,251 prosecutions, 207 cases were dismissed, 734 individuals were fined, 222 imprisoned, and 88 admonished and bound over.

Duration of Unemployment.

SOME indication of the duration of unemployment is given in Tables 9 and 10 in which the policies lodged are analyzed according to the period for which payments were made, during the week ending November 22, 1919, for civilians (the last full week of their out-of-work donation) and the week ending February 20, 1920, for His Majesty's Forces.

¹ These statements do not include figures for persons in part-time employment.

Short-Time Policies.

THE decline in the number of short-time policies was rapid up to the time of the railway strike at the end of September, the total number of civilians and His Majesty's Forces' policies having decreased from 100,000 on May 23, 1919, to 60,000 on June 13, 1919, and so on to 26,984 on September 19, 1919. But on October 10 there were 30,804, on October 24, 37,471, on October 31, 38,092, and on November 28, the date of the last report containing figures for civilian donations, there were 42,899 short-time policies lodged. This increase which was started by the railway strike was maintained by the molders' strike—the number of policies lodged by short-time workers in engineering and iron-founding industries having mounted from 186 men on September 19 to 3,735 on October 17 and to 16,074 on November 21.

Considering His Majesty's Forces' short-time policies only there were 4,687 lodged on November 28 (of which 3,833 were in engineering and iron-founding industries) and 5,241 on December 5. The number has since declined, as shown in Table 11, to 2,070 on February 13.

The molders' strike has been a long-drawn-out one, and as will be noticed, in its final week, ending January 23, the industries affected took over 98 per cent of the short-time policies lodged.

TABLE 11.—NUMBER OF HIS MAJESTY'S FORCES' POLICIES LODGED BY SHORT-TIME WORKERS AT EACH SPECIFIED DATE, BY INDUSTRY.

Industry.	Week ending—

Review of the Employment Situation.

TABLES 12 and 13 show the numbers of unemployment donation policies remaining lodged at specified dates and numbers of persons on live registers of employment exchanges on the same dates.

Both are indications of the amount of unemployment, but neither can be accepted as absolutely indicative of the exact amount of unemployment.

A fall in unemployment as indicated by a decrease in the live register of employment exchanges is not always accurate, for while it may be due to an increase of employment it is likely to be partially at least due to a well-known disinclination to register at an employment exchange when the worker being in an uninsured industry is not entitled to draw payment.

The Weekly Report for December 16 states with reference to a recent 16 per cent drop in the live register for women: "The decreases chiefly occur in the uninsured industries, particularly domestic offices and services. This is an effect previously observed, that when payment of donation stops the persons concerned cease to register for employment."

The weeks following January 22 showed a reduction in the number of people on out-of-work donation of 22 per cent, from 396,495 January 23 to 310,598 on February 20. Nearly 10 per cent of the latter were drawing donation under the special extended period scheme.

Industrially the improvements in employment came from the further resumption of work in engineering and iron founding and iron and steel work and from a considerable impetus given to building and works of construction.

¹ No report owing to railway strike.² Report for January 2, 1920, covers two weeks, owing to the Christmas holiday.

Table 14 classifies out-of-work donation policies lodged by industries and shows for specified dates the per cent policies lodged formed of the total number of workers in the industries. The figures may be taken as indicating approximately, but not absolutely, the unemployment in the several industries.

September 19 immediately preceded the railway and molding trades strikes, the effects of which are evident in the reports for subsequent dates.

TABLE 14.—PER CENT WORKERS REPRESENTED BY OUT-OF-WORK DONATION POLICIES REMAINING LODGED AT SPECIFIED DATES FORMED OF TOTAL WORKERS IN EACH INDUSTRY.

Industry.	Total workers. ¹	Per cent workers represented by policies remaining lodged in each industry form of total workers on—										Total workers. ²		Per cent workers represented by policies remaining lodged in each industry form of total workers on—

Grand total.....	4, 782	4, 736	4, 519	60, 424

¹ First placements only. Subsequent placements amount to 4,494 for the whole period, 426 for the month ended Dec. 5, 1919, and 441 for the month ended Jan. 9, 1920.

Apprenticeship Schemes.

Up to February 9, 1920, 25,328 agreements as to the completion of interrupted apprenticeships had been submitted to employers, completed, and sent to the training department of the Ministry of Labor. Up to September 8, 1919, reports were published showing the number of interrupted apprenticeship applications received from employers and from employees, and at that date 14,635 had been received from employers, 17,297 from employees, while 12,685 agreements had been submitted to employers for completion, and 11,172 completed agreements had been sent to the training department. In other words, 18 per cent more employees than employers had made application, and agreements for completion were submitted to 86 per cent as many employers as made application, while 88 per cent of the agreements submitted had been completed and sent to the training department.

Comparing this report with earlier reports it is found that the employers had been making application in an increasingly greater pro-

portion to the number of employees, that about the same proportion of agreements had been submitted to employers, and a rapidly increasing proportion of completed agreements had been sent to the training department. Since September these details have not been published.

The total number of completed agreements sent to the training department since the commencement of the interrupted apprenticeship scheme, classified by industries, is shown in Table 17.

TABLE 17. -NUMBER OF COMPLETED AGREEMENTS UNDER EACH SPECIFIED SCHEME UP TO FEB. 9, 1920, UNITED KINGDOM.

Training of Unemployed Women.

The scheme for the training of unemployed women does not appear to have attracted those for whom it was intended in anywhere near the proportion which might have been expected. Up to February 21, 1920, only 5,641 woman applicants had been interviewed and of these 1,007 had been definitely registered, 1,180 had completed their training and 2,644 were in training. The remainder of those who had been accepted ostensibly either were waiting opportunity for training, or had not yet decided to accept the opportunity offered. Table 18 indicates the occupations in which women are being trained.

Training of Widows and Dependents of Ex-Service Men.

Statistics of the training department's scheme for bettering the condition of widows and dependents of ex-service men by giving them industrial training appear in the following statement:

During the week ending February 14, 1920, 21 applications were received, 16 applications were sanctioned, while 21 were rejected or the applicants withdrew before training was commenced, and 6 completed training. The total numbers to date were 1,909 applications received, 989 sanctioned, and 772 rejected or withdrawn before training; 736 widows or dependents commenced training, 23 withdrew from training, 410 had completed training, and 303 were under training; while 254 applicants were awaiting decision, and 147 applicants, sanctioned, were awaiting training.

National Scheme for the Employment of Disabled Ex-Service Men.⁷

The following statement shows the results obtained up to February 13, 1920, of the scheme inaugurated in September, 1919, for a more rapid absorption into industry of disabled ex-service men through a closer cooperation of employers:

During the week ending February 13, 1920, 438 undertakings (proposals by firms) were accepted by the employment committee,

⁷ See MONTHLY LABOR REVIEW, January, 1920, pp. 205-207.

making a total accepted to date of 12,251, while 540 were awaiting decision. At the end of that week 119,675 disabled men were already employed by the 12,251 enrolled firms, leaving 4,797 vacancies to be filled to complete the quota (124,382) for whom employment had been guaranteed.

Appointments Department.

The following statements exhibit the results of the work of the appointments department of the Ministry of Labor. This department was inaugurated in April, 1918, to advise, arrange technical training for, and satisfactorily place ex-service men in commerce and the professions—at first disabled officers only, but after the armistice demobilized men in general and civilians as well.

Table 19 gives information as to the actual placing of men in positions for which they have been trained, and this is followed by statements as to the training grants scheme for business, professional, and university training.

Vacancies notified during week.....				718				816
Vacancies carried forward at end of week.....				23,573				3,199

Up to February 13, 1920, 91,322 ex-service men (officers and other ranks) had applied for grants for business, professional, or university training and 17,813 of these applications had been canceled, leaving 73,509 to be considered. Of this number 43,488 had been sanctioned and 9,719 definitely rejected, while 33,745 were actually in training in courses averaging, according to class of course, from 15 months to two years and four months.

The total financial commitments up to the end of January, 1920, were £8,777,551,⁸ and of this amount payment had actually been made of £1,453,853. The average cost for maintenance and fees per trainee are given as £129 for courses averaging 15 months, £252 16s. for courses averaging two years (agricultural), and £312 for educational courses averaging two years and four months.

⁸ Owing to fluctuations in rates of exchange conversions are not made into United States money. Normally the par value of the pound is \$4.8665, and of the shilling 24.3 cents.

Report of Employment Exchanges in the United Kingdom.

AS REPORTED by the British Labor Gazette for February, 1920, the operations of the employment exchanges for the five weeks ending January 9, 1920, are summarized as follows:

The average daily number of registrations, of vacancies notified, and of vacancies filled during the five weeks was 14,132, 4,793, and 3,257, respectively.

Compared with the previous month, the daily average of registrations showed a decrease of 2.4 per cent, while the daily average of vacancies notified and vacancies filled showed decreases of 7.9 per cent and 8.4 per cent, respectively. The decrease in the number on the register at the end of this period shows recovery from the seasonal decline.

In the principal occupational groups the daily average number of applications from adults was 12,415—10,244 men and 2,171 women. There were 3,798 vacancies reported—2,028 men and 1,770 women. The average daily number of positions filled, when compared with the previous month, showed a decline of 11 per cent among men and 15 per cent among women.

The occupational groups in which there were the largest number of positions filled by men were: Building and construction of works, 24 per cent; engineering and iron founding, 16 per cent. Fifteen per cent were general laborers. Sixty-six per cent of the women were placed in domestic service and 6 per cent in the dressmaking trades.

As regards juveniles, the daily average of registrations was 1,717, while that of vacancies notified was 995. The daily average number of vacancies filled during the month as compared with the previous month showed an increase of 10 per cent.

Of the total vacancies filled for juveniles, 36 per cent were filled by applicants who obtained their first situation since leaving school.

Volume of Employment in the United Kingdom in January, 1920.

THE following figures as to the condition of employment in Great Britain and Ireland in January, 1920, as compared with December, 1919, and January, 1919, have been compiled from figures appearing in the British Labor Gazette for February, 1920. Similar information for October was published in the January **MONTHLY LABOR REVIEW**.

In January, 1920, as compared with December, 1919, relative to the number of persons employed, the largest increase, 7.2 per cent, appears among seamen, while respective increases of 5.2 and 4.5 per cent are shown in wholesale mantle, costume, blouses, etc., in London, and the same trade in Manchester. The largest decreases—1.9 and 1 per cent—appear in the food preparation trade and the printing trades.

Comparing January, 1920, with December, 1919, on the question of earnings of employees, increases of 6.6 and 5.9 per cent are shown in the jute trade and the lace trade, respectively. Percentage decreases of 2.2, 1.9, and 1.7 are shown in the food preparation, brick, and printing trades, respectively.

In comparing January, 1920, with January, 1919, as to the number of persons employed, dock and riverside labor shows an increase of 69.2 per cent; the cement trade, an increase of 68.2 per cent; and the glass trade, the printing trades, and the brick trade, respective increases of 46.7, 37.6, and 36.8 per cent. The only decreases shown are 1.3 per cent in the linen trade and 0.4 per cent in the printing trades.

The aggregate earnings of employees in January, 1920, as compared with January, 1919, show important changes, all of which are increases. Respective increases of 101.7, 74.5, and 73.9 per cent are shown in the cement, glass, and lace trades. Fourteen trades show increases ranging from 37.3 per cent in the cotton trade to 69.5 per cent in the printing trades, while the shirt and collar trade shows an increase of 33.6 per cent.

VOLUME OF EMPLOYMENT IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) IN JANUARY, 1920, AS COMPARED WITH DECEMBER, 1919, AND JANUARY, 1919.

CHILD LABOR.

Employment of Children Under Federal Child Labor Tax Law.

THE National Child Labor Committee (105 East Twenty-second Street, New York City) has recently issued a statement directing attention to the fact that the decision of Judge James E. Boyd, of the Western Judicial District of North Carolina, granting an injunction preventing an employer from discharging or limiting the hours of work of a child subject to the Federal child labor tax law applies to one specific case only. It had been generally thought that Judge Boyd's decision affected the employment of minors in the entire western judicial district of the State. It is announced that so far this is the only instance of record where a child may be legally employed for more than 8 hours a day. The National Child Labor Committee states:

In a letter to the National Child Labor Committee, Miss Nila F. Allen, head of the Child Labor Tax Division of the Treasury Department, says:

Unlike the situation under the Federal child labor law, declared unconstitutional June 3, 1918, the injunction secured in the case of the Federal child labor tax law applied only to the employment of one child in the Atherton Mills, Charlotte, N. C.

The child labor tax has been and is being enforced in all sections of the country, including the Western Judicial District of North Carolina.

It should be remembered that the Federal child labor tax law applies only to mines, quarries, factories, and similar establishments. It is estimated that 85 per cent of the working children in this country are in industries not covered by the law.

Regulation of Child Labor in Czecho-Slovakia.

ON JULY 17, 1919, the National Assembly of the Czecho-Slovakian Republic passed a child labor law which was promulgated on July 28, 1919, and became effective three months after its promulgation.¹

The law defines as children all boys and girls who have not completed their fourteenth year of age. Child labor within the meaning of the law is the regular employment of children at whatever labor for or without compensation. The performance of work by children

¹ Amtliche Nachrichten des Deutschösterreichischen Staatsamtes für Soziale Verwaltung. Vol. I, No. 19. Vienna, Oct. 15, 1919, pp. 774-777.

for purposes of training or instruction, as well as the employment of children at casual jobs, and the employment of own children at light, although regular, household work, is not to be considered child labor. Own children within the meaning of the law are children living in common household with the employer, who are related to him by blood or marriage up to the third degree, or live with him as foster children or wards.

The employment of children at manual labor or other occupations is permissible only in so far as it does not endanger their health, their physical and mental development, or their morals, and in so far as it does not interfere with their attendance at school.

The employment of children who have not completed their twelfth year of age is prohibited. Children over 10 years of age may, however, be employed at light agricultural or household work.

On school days children may not be employed at labor in excess of two hours. Their employment at labor before the morning session of school and during the two hours preceding the afternoon session is prohibited. With respect to agricultural and household work this prohibition is limited by the law to two hours preceding the school session. A period of recreation of one hour is to be granted after school hours. On school holidays children may not be employed at labor in excess of 4 hours, except that in agricultural and household work employment may not exceed 6 hours.

The employment of children at labor on Sundays and church holidays is prohibited.

Children employed in agriculture and at household work must be allowed an uninterrupted night rest of 10 hours from 8 p. m. to 6 a. m. In all other fields of child labor the employment of children between 8 p. m. and 7 a. m. is prohibited.

The law provides for the granting of exemptions from the provisions regulating the hours of labor and the Sunday and holiday rest in the case of work of an urgent nature.

In restaurants, saloons, cafés, etc., children may not be employed at dispensing drinks or serving patrons. Neither may they be employed in taking part in public performances, unless such performances are of an educational, artistic, or scientific nature. In addition the law prohibits the employment of children in a number of establishments and occupations specified in a list appended to the present article.

If an employer employs other than his own children for compensation in money he may deduct from their wages only lodging, board, clothing, and school supplies furnished by him and the prices charged therefor may not exceed the actual cost. Children may not be given alcoholic beverages as compensation for their work.

Whoever employs other children than his own must without delay report their employment to the communal authorities of his place of residence, indicating the nature of his establishment and of the employment of the children. He must also keep a correct list of the children employed and, on request, submit this list to the proper supervisory officers.

Anybody intending to employ other children than his own must previously apply to the communal authorities for a work card for each child. For children already employed on the coming in force of the present law a work card must be procured within three days. The cards are to be issued for one year and must be renewed on their expiration. They are to be issued free of charge by the communal authorities of the place of residence of the child after a hearing of the legal representative of the child and of the competent school authorities. If the communal or school authorities doubt the physical or mental fitness of the child for the labor in question the child must be examined by the communal physician at the expense of the employer. The issuance of a work card must be refused if in the opinion of the physician or the school authorities the labor in question would endanger the morals or the physical or mental development of the child.

The law charges the political authorities of the first (lowest) instance with the enforcement of its provisions. In addition, it provides for the appointment of special supervisory officials whose principal duty shall be the inspection of those establishments which employ children.

Contraventions of the law, if not subject to severer penalties in accordance with other laws, are punishable with fines up to 1,000 crowns or imprisonment up to three months. Illegal employment of own children is punishable by a reprimand, or in case of aggravating circumstances, with a fine up to 300 crowns or imprisonment up to 14 days. Persons convicted of a contravention of the law may temporarily or permanently be enjoined by the political authorities from employing children.

The law authorizes the Minister of Social Welfare to conclude agreements with foreign countries for assuring the application abroad of the principles of the present law.

Establishments and Occupations in which Employment of Children is Prohibited.

FOLLOWING is presented a list of the industrial establishments and occupations in which the employment of children is prohibited:

I. Establishments.

- Retail sale of alcoholic beverages, distilleries, beer and wine cellars, breweries.
- Establishments manufacturing articles made of slate, with the exception of shops merely effecting the dyeing, painting, pasting, and packing of slate pencils and the dyeing, ruling, and framing of slates.
- Stone quarries and pits.
- Establishments of stonemasons, rock borers, and stone polishers.
- Brick kilns, street paving, and carpenters' establishments.
- Lime and gypsum burning.
- Manufacture and painting of pottery, tile, and flagstones.
- Glass blowing, etching, polishing, frosting and painting, with the exception of glass-works in which the blowing is done exclusively at the lamp.
- Mirror silvering establishments.
- Establishments in which objects are being enameled, electrogalvanic plated or electrolytic reproductions manufactured.
- Establishments in which lead and tin toys are being painted, lead, copper, tin, and brass works.
- Establishments for metal bronzing.
- Establishments in which lead, copper, zinc, or alloys of these metals are being worked up or used.
- Establishments for metal polishing, manufacture of files, harness making.
- Establishments using mercury.
- Establishments producing, working up, or using lead or lead compounds.
- Establishments for the manufacture of explosives, fireworks, matches, and other inflammables.
- Establishments manufacturing celluloid articles.
- Chemical establishments.
- Dead animal recovery plants.
- Chemical bleaching and dyeing works.
- Rag sorting establishments.
- Establishments for the salting, dressing, and tanning of skins and hides.
- Manufacture of rubber and gutta-percha articles.
- Horsehair spinning mills, rabbit-hair cutting establishments, and other establishments in which animal hair is worked up.
- Establishments for the cleaning and dressing of hair and bristles, brush factories.
- Mother-of-pearl goods factories.
- Bakeries.
- Butcher shops, establishments for the cleaning of feathers for bedding.
- Chemical laundries.
- Establishments of painters, decorators, and lacquerers.
- Liveries and teaming establishments.
- Turners' shops.
- Flour mills.
- Chimney-sweeping establishments.

II. Occupations.

Attendance of power engines and all machines operated by power, power transmission, elevators.

Attendance of machines operated by hand, with the exclusion of ordinary hand winding-off machines, bobbin reels, and so-called spinning machines for the manufacture of artificial flowers.

Attendance of gins or similar dangerous engines.

Attendance of straw and feed-cutting machines.

Building and excavating work.

Employment at apparatus in which are contained fluids, steam, or gases under pressure.

Furnace and open-hearth work.

Employment at work involving the generation of dust or gases.

Collection and assorting of rags, junk, etc.

Mixing or milling of paint.

Work in beer, wine, and other cellars.

Setting up of pins in bowling alleys.

Breaking of stones.

Lifting, carrying, or moving of heavy burdens

Woodcutting or chopping.

Thrashing.

Mowing.

Beater of game at battues.

Drawing in of nets in fishing.

INDUSTRIAL ACCIDENTS AND HYGIENE.

Use of the Geophone for Mine Rescue Work.

ACCORDING to Safety, the bulletin of the Safety Institute of America, for November-December, 1919,¹ the United States Bureau of Mines has been developing the geophone, or listening instrument used in war operations, for peace-time uses in mines. It is suggested by the bureau that this instrument will be of value to mine-rescue crews who may be entering mines for exploration, and for locating miners who have been entombed after a disaster. The instrument was invented by the French during the war for the purpose of detecting enemy sapping and underground mining operations and for the location of enemy artillery.

During the same period, according to the account in Safety, engineers of the mining division of the United States Bureau of Mines were engaged in experiments for the purpose of determining the distance that the various mining machines could be heard through clay, shale, coal, and the mine cover. Measurements were also made of the energy required to make blows heard for definite distances through clay, shale, and coal, as well as of the distances at which the shock waves resulting from the discharge of various explosives could be heard. The factors influencing the transfer of energy from a mining tool to the clay and coal were also investigated, in order that recommendations could be made as to the type of mining machine which could be used to accomplish the greatest amount of work with a minimum of noise.

The mechanism and operation of the geophone are described as follows:

The instrument, though small, is essentially a seismograph, since it works on the same principle as the ponderous apparatus with which earthquake tremors are recorded. It consists of an iron ring about $3\frac{1}{2}$ inches in diameter, within the center of which is suspended a lead disc which is fastened by a single bolt through two mica discs, one of which covers the top and the other the bottom of the ring. There are two brass cap pieces, the top one having an opening in its center to which is fastened a rubber tube, leading to a stethoscopic earpiece. These cap pieces are fastened with bolts to the iron ring and serve also to hold the mica discs in place.

We then have nothing but a lead weight suspended between two mica discs cutting across a small air-tight box. If the instrument is placed on the ground and a person is pounding or digging in the vicinity, energy is transmitted as wave motion to the earth, and the earth-waves shake the geophone case. The lead weight, on account of its mass and because it is suspended between the mica discs, remains comparatively motionless. There then is produced a relative motion between the instrument case

¹ Safety. Bulletin of the Safety Institute of America. November-December, 1919. New York. Pp. 206-208.

and the lead weight. The result is that a compression and rarefaction of the air in the instrument takes place. Since the rubber tube leading to the stethoscopic ear-piece is connected with this space in the geophone, this rarefaction and compression is carried to the eardrum.

As usually two instruments are used, one for each ear, it has been found that the sound is apparently louder from the instrument nearer the source of the sound. By moving the instruments properly, however, a point can be found where the sound will be of the same apparent intensity in both ears. The direction of the sound is then on a perpendicular to the line connecting the centers of the two instruments either in front of or behind the observer. Further observation will show which side. Direction of sound is quite accurately determined in this way.

An Occupational Dermatosis Observed in the Leather Trade.

A SKIN complaint which attacks certain employees engaged in fellmongers' yards is discussed by Dr. R. Prosser White in *The Journal of Industrial Hygiene* (Boston) for February, 1920. He assigns the condition to a hitherto unreported cause and says:

In the first stage of the leather trade fresh skins, called pelts, are cured, and the epidermis with its appendages removed. In the case of sheep and the smaller animals this is done in fellmongers' yards. The skins of cattle, horses, deer, pigs, etc., required to make other varieties of leather are cured and unhaired at different establishments or in the annexes to tanyards. The treatment is very much the same in both.

In the fellmongers' yard, if the hair or wool is intended to remain on the pelt, this is steeped in brine. If the wool requires removing, the fleshy sides of fresh or salt-free sheepskins are laid against each other, having previously been liberally brushed over with a thick cream containing an excess of slaked lime and 5 per cent sodium sulphide. They are then lifted into the floods or vats by men called jobbers or washers. After remaining there for a sufficient time the pelts are carried to the washing pits by the curers.

Gloves are invariably worn for the first removal, particularly in the foreign pelt trade, where a very strong solution of sodium or calcium hydrosulphide is used as a quick unhairer.

In the second removal, and also during inspection, the hands are bare, and the beginner or careless worker suffers great discomfort owing to redness, tenderness, and cracks which appear on the hands from these chemicals. In these workmen as many as four to a dozen small ulcers, the size of a split pea, will be seen on the sides of the knuckles and on the interdigital skin of the fingers. The knuckles are swollen and inflamed.

The pelts are then conveyed to the unhairing room and placed, hair uppermost, on the pulling beam. The pullers scrape off the hair or wool by rubbing down the woolly skin with the balls of the naked thumbs and the ulnar edges of the palms of both hands. The characteristic rash and holes appear on these parts in the pullers. An expert puller will unwool 1,000 sheep in a week.

The interaction of sodium sulphide with milk of lime produces calcium hydro-sulphide and caustic soda. These cause the mischief in this particular trade. If neglected, the ulcers penetrate deeply, the sores easily becoming infected, causing inability to work.

An effective trade-shop remedy is a drop of Stockholm tar applied to each hole. This appears to act as a protective, enabling the men to "carry on." Frequent washings of the hands in a weak solution of vinegar and water, followed by the thorough rubbing in of an ointment, are helpful preventives.

The author gives the formula for an ointment which he has found effective in such cases.

Minister of Hygiene for France.

AN INNOVATION has been made by Premier Millerand in the organization of the new French cabinet by the creation of the office of Minister of Social Hygiene, Social Insurance, and Social Provision (*Ministère de l'hygiène, de l'assurance et de la prévoyance sociales*), as noted in the foreign correspondence of the Journal of the American Medical Association (Chicago) for March 6, 1920. The question of appointing a special minister of public health has been considered since 1902, and the present action consists in giving permanent form to the temporary organization, under the chairmanship of M. Clemenceau, of a ministerial conference which grouped together all the services having to do with health and hygiene that had been previously scattered through five ministerial departments. The new office of minister of hygiene has been conferred upon J.-L. Breton, whose experience as chemical engineer, adviser to the Chamber of Deputies in matters of social hygiene, and author of the bill to suppress the use of white lead in building paint made him the "logical choice for the new post."

WORKMEN'S COMPENSATION.

Workmen's Compensation Law of Virginia Amended.

THE Workmen's Compensation Commission of Virginia secured the cooperation of employers and employees in the enactment of a law amending in several respects the compensation act of the State. The fact of this cooperation is regarded as a reflection of "the true spirit that underlies legislation of this character—the bringing together into closer relationship of all employers and employees."

The first amendment provides for the subrogation of the employer to any right an injured workman may have to sue in damages a third party legally liable for the injury. Any excess recovered by the employer in the suit shall be for the benefit of the injured person or his beneficiaries, and no compromise settlement may be made by the employer or insurance carrier in such a case without the approval of the industrial commission.

The second amendment extends the time for the furnishing of medical service from 30 days to 60 days; while the third provides payment of compensation for the two weeks' waiting time in case of a disability continuing more than six weeks. The maximum weekly payment for disability or death is increased from \$10 to \$12 and the maximum total from \$4,000 to \$4,500.

Instead of the loss of an eye the loss of vision entitles to compensation, and a permanent partial loss is to be proportionately compensated. A new subsection provides for compensation for the permanent loss of use of any member as for the loss of the member, and a permanent partial disability loss or loss of use is to be proportionately compensated.

The salaries of the members of the commission are increased from \$3,600 per annum to \$4,200 and of the secretary from \$2,000 to \$3,000. The commission is also given authority in its own right to enforce the attendance of witnesses and the production of books and papers without having to call on a court to render this service for it, as under the original act.

There was considerable activity in behalf of a State insurance fund, which had strong support but failed of enactment. It is said that a competitive fund might have been provided for, but was not desired by the friends of the measure.

Compensation Table for Visual Losses of One Eye.

By FRANK ALLPORT, M. D.

THIS is a table for the estimation of compensation to be paid workmen who have suffered partial or complete loss of vision of one eye through accident or occupation. At present no recognized standard of compensation conclusions exists. Chaos and uncertainty abound, and apparently one medical expert's guess is as good as another's. Several compensation tables have been proposed, but none have proven acceptable. No table can be perfect, because of varying conditions accompanying each case. Some reasonable standard is, however, essential, as a working basis, by which litigation may be guided. Everyone recognizes that the old Snellen test type fractions are incorrect and misleading. For instance, 20/40 does not mean a one-half loss of vision, nor 20/50 a three-fifths loss of vision, etc., and yet this is the method of estimating lost vision prevailing in our courts. The Chicago Ophthalmological Society (the largest local eye society in the United States) at its meeting November 10, 1919, adopted the following table as its official expression of opinion as to what constitutes a fair basis of settlement of visual losses in one eye following accidents, etc. This matter has been under consideration by the society for two or three years and this table voices its deliberate opinion, and it is fair to presume can be safely recommended for general adoption. There are, of course, other features concerning visual losses that must always be considered, such as injuries to both eyes, vision after cataract operations, progressive optic atrophy, corneal scars, etc. Personal medical expert opinion will always be necessary, table or no table, but some standard is essential as a basis for settlements. Such a standard should not be the opinion of one man, but should be the thoroughly considered sentiment of a scientific, well-recognized organization of eye surgeons. The table submitted has the indorsement of the Chicago Ophthalmological Society, and is probably as fair and equitable as a table can be made at this time.

Basis of settlement of visual losses in one eye.

20/ 20	indicates 100	per cent of visual efficiency and	no	loss of vision.
20/ 30	"	94.5 per cent	" " " "	5.5 per cent " " "
20/ 40	"	89.0 per cent	" " " "	11.0 per cent " " "

20/ 60	"	78.0 per cent	" " " "	22.0 per cent " " "

20/ 70	indicates	72.5 per cent	of visual efficiency	and 27.5 per cent	loss of vision.				
20/ 80	"	67.0 per cent	" "	" "	33.0 per cent	" "	" "	" "	" "
20/ 90	"	61.5 per cent	" "	" "	38.5 per cent	" "	" "	" "	" "
20/100	"	56.0 per cent	" "	" "	44.0 per cent	" "	" "	" "	" "
20/110	"	50.0 per cent	" "	" "	50.0 per cent	" "	" "	" "	" "
20/120	"	41.0 per cent	" "	" "	59.0 per cent	" "	" "	" "	" "
20/130	"	36.5 per cent	" "	" "	63.5 per cent	" "	" "	" "	" "
20/140	"	32.0 per cent	" "	" "	68.0 per cent	" "	" "	" "	" "
20/150	"	28.5 per cent	" "	" "	71.5 per cent	" "	" "	" "	" "
20/160	"	23.0 per cent	" "	" "	77.0 per cent	" "	" "	" "	" "
20/170	"	18.5 per cent	" "	" "	81.5 per cent	" "	" "	" "	" "
20/180	"	14.0 per cent	" "	" "	86.0 per cent	" "	" "	" "	" "
20/190	"	12.0 per cent	" "	" "	88.0 per cent	" "	" "	" "	" "
20/200	"	10.0 per cent	" "	" "	90.0 per cent	" "	" "	" "	" "

Snellen's test letters are used and should be hung in a good light 20 feet from the applicant. The uninjured eye should be covered during the test. Vision is expressed in fractions. The distance of the applicant from the letters constitutes the numerator of the fraction; the smallest line seen constitutes the denominator. Thus, if the applicant is seated 20 feet from the letters and can see the line marked 20, his vision is 20/20 or normal. If he can only see the 50-foot line, his vision is 20/50, etc. The applicant should be given credit for a line if he can read a majority of the letters in the line.

This table assumes that if an injured applicant can see the 200 line while sitting 20 feet away, in other words, if he has still a vision of 20/200, he is not industrially blind—his visual efficiency is 10 per cent and his visual loss is 90 per cent. If his vision is worse than 20/200 he is industrially blind. From 20/200 vision is gradually scaled up to 20/20 or normal, by fractions of 10, as will be seen on the table, and estimations of visual efficiency and visual losses deducted thereby. Such estimations and the financial awardings will, of course, have to be governed by the laws in the various States.

My advice, therefore, in the interest of harmony, uniformity, and equity, and because the above table has been officially adopted by the Chicago Ophthalmological Society, and will receive its indorsement and support, is to abandon all other tables and endeavor to secure the adoption of the above table by industrial commissions, courts of justice, corporations, accident companies, attorneys, physicians, etc.

SOCIAL INSURANCE.

Report of the Illinois Pension Laws Commission, 1918-19.

THE Report of the Illinois Pension Laws Commission, 1918-19, is the title of a volume of 379 pages issued by a commission created by an act of the Illinois Legislature, bearing date of June 14, 1917. This commission of four persons was charged with the duty of investigating the operation of existing pension laws in the State and of gathering information as to cost of maintenance and other details of operation. Similar laws of other States and countries were also to be studied. A commission of like function had been appointed in 1916 and the present commission was largely a continuation of the earlier one. A number of pension laws were enacted in 1917, and at present there are 15 pension laws on the statute books of the State. The funds now in existence relate to policemen, firemen, teachers, and a few other classes of municipal employees. There are separate laws for Chicago and for other sections of the State. The general charge is made that the existing funds are financially insecure and that the laws lack uniformity and comprehensiveness.

The commission presents "a proposed standard plan for a comprehensive and permanent system of pension funds to replace the unsound systems under the present pension laws for public employees in Illinois." The plan provides for compulsory contributions, with certain exceptions. The proposed plan has for its central feature the accumulation of a sufficient amount to provide an annuity at the age of retirement equal to a definite percentage of the highest salary of the retiring employee. "These accumulations would accrue from contributions made by the public as employer and by the employee at a fixed ratio." Provision is also contemplated for the widows of employees dying before attaining the age of retirement, and for survivorship annuities for the widows of retired employees. Withdrawal from service is also provided for under a variety of conditions. The scheme covers old age inefficiency, death, sickness, and accidents.

A standard retirement age of 55 years is fixed for policemen and firemen and 60 years for all other employees, with a minimum age of retirement of five years lower. Policemen and firemen are to retire on 50 per cent of their salary and others on 40 per cent, if their

accumulations are sufficient to pay so much. The ratio of contribution between the employer and the employee is three to one for policemen and firemen and two to one in other branches of the public service, contributions by the employee being limited to 4 per cent of salary and by the employer to 12 per cent of salary in the case of policemen and firemen and to 8 per cent in the case of other employees. No amount of salary in excess of \$2,500 is to be considered as the basis of either contributions or annuities. Interest at 4 per cent is compounded annually on contributions made by or in behalf of employees, and refunds prior to retirement are to be made at that rate.

The foregoing provisions relate to retirement annuities only. Life insurance is a separate provision, the public and the employee to bear the expense equally, employee's contributions not to exceed 2 per cent of his salary. The amount of the insurance is limited to 175 per cent of the annual salary in the case of policemen and firemen, and 125 per cent in other cases. Sickness and accident insurance are likewise sustained by equal contributions of the public and employee, where the misfortune is not the direct result of the performance of duty, the benefits to be paid in monthly installments equal to 30 per cent of employee's salary, unless the employee attains the standard age of retirement before recovery. Where disability results directly from the service, the expense is borne entirely by the employer. In this case the monthly payment to the employee is 75 per cent of his salary, payments to be continued during disability unless employee attains, before recovery, an age five years beyond standard age of retirement.

The claim is made that the system is worked out on a sound actuarial basis, and illustrative tables are provided to demonstrate its operation in its various lines. A complete draft of a bill is presented, the administration to be in the hands of retirement boards for each of the 11 groups of employees provided for in the measure.

A survey of the various positions in the public service of the State, statistics of ages, years of service and salaries of certain classes of employees, the effect of pension legislation of 1917, court decisions on pension systems, and a digest of the laws enacted in 1917 make up the remainder of this study in so far as the State is concerned. Other chapters discuss recent developments in pension legislation in other States of the Union, and the world's experience in the operation of public service pension systems. Industrial and institutional pension systems are also briefly considered.

Regulation of the Employment Service and Unemployment Insurance in Italy.¹

IMMEDIATELY upon the signing of the armistice, consideration was given by the Italian Government to the question of providing relief against the involuntary unemployment which would be the natural result of the transformation of industry from a war to a peace basis and of the demobilization of the army, and by a decree of November 17, 1918, an appropriation of 100,000,000 lire (\$19,300,000, par) was made for this purpose.² By additional decrees, provision was made for the establishment of an elaborate system of employment offices in conjunction with existing governmental agencies and private organizations and also for the payment of unemployment grants.

Establishment of Central Employment Office.

UNDER the terms of the decree of November 17, 1918, a central employment office for manual workers was established in the Ministry of Industry, Commerce, and Labor, which was given supervision over the activities of all local bodies engaged in the placing of labor, and whose duty it should be to study questions relating to the employment of labor both in Italy and abroad. In connection with the central employment office, a consulting and advisory commission was appointed, composed of representatives of industrial and agricultural employers and workers, and representatives of the Government departments concerned. It was further provided that in each prefecture or provincial government a provincial labor commission (*commissione di avviamento al lavoro*), charged with the collection of requests for and offers of labor transmitted by the communal commissions, should be established.

The State railway administration is authorized to grant the special military rates to groups of five or more workers of either sex who travel third class at their own expense to the same locality for employment, provided such groups hold a certificate from an employment office or labor commission.

In every commune where a properly constituted employment office has been established, a labor commission is provided for, composed of a representative of the communal government, who shall be neither of the employing class nor of the working class, and of a representative of each of these classes. These communal commissions are charged with gathering and registering requests for and

Italy: Ufficio Nazionale per il Collocamento e la Disoccupazione. *Il Mercato del Lavoro*. Vol. 1, No. 1. Rome, Dec. 1, 1919. *Gazzetta Ufficiale*, Rome, Dec. 10, 1919.

United States: Bureau of Foreign and Domestic Commerce. *Commerce Reports*, Dec. 11, 1919, pp. 1440 ff.; Dec. 29, 1919, pp. 1765 ff., and a communication from the commercial attaché at Rome to the director of this bureau, dated Jan. 12, 1920.

² See *MONTHLY LABOR REVIEW*, Apr., 1919, p. 225.

offers of labor presented by residents of the commune. Where municipal labor offices exist, the commissions and committees established by such offices may be authorized to act as communal labor commissions, provided they are composed of an equal number of employers and workers.

Provision is made for the extension of financial aid by the Government to employment offices for manual workers of the following classes:

1. Those established by the Provinces and communes;
2. Those established jointly by agreement between employers and workers;
3. Those established by labor organizations and recognized by the corresponding employers' organizations, or vice versa, for placing workers in particular industries.
4. Those established by charitable institutions or similar bodies.

Aid may also be granted to other organizations which promote the establishment of employment offices on a proper financial and administrative basis.

With the exception of those established by labor organizations, the management of employment offices is confined to a commission consisting of two members representing the employers and two representing the workers. These members nominate the president. Employment offices established or registered under this decree assume no responsibility for the exact fulfillment of labor contracts concluded through their mediation. In the case of disputes regarding labor agreements the employment office suspends the placing of labor in the establishment in question either directly or so far as other offices are concerned, until a settlement has been reached.

Decree of February 9, 1919.

For office workers and others who do not perform manual labor, provisions similar to the above are made by the decree of February 9, 1919. Financial aid is extended by the State to employment offices established in this connection, which are placed under the supervision of the central employment office, and provision is made for representation on the central advisory committee. In place of establishing separate employment offices for nonmanual workers, separate departments may be provided for them in the general employment offices. In addition to granting aid to employment offices for nonmanual workers, the State makes contributions to professional and welfare associations for this class of workers, which grant unemployment relief to their members.

Recent Changes in Plan of Organization—Unemployment Insurance.

AS A result of the experience gained by the Italian Government since the signing of the armistice in November, 1918, in combating unemployment, new measures were recently enacted in a

decree dated October 19, 1919, and published in the Gazzetta Ufficiale of December 10. These measures make radical changes in the plan of organization and the provisions for the payment of unemployment grants established by the decrees of November 17, 1918, and January 5, 1919, and should produce more satisfactory results. In addition to modifying the administrative organization previously established in such a way as to centralize and coordinate more effectively all the activities of the Government with regard both to employment and to unemployment, provision is made for the establishment of a permanent system of unemployment insurance which will be maintained through a fund to which not only the State but also the employers and the workers will contribute.

The decree of October 19, 1919, consists of 56 articles grouped under four titles. Its provisions are summarized below.

Changes in Administrative Organization.

A single office, called National Employment and Unemployment Office (*Ufficio Nazionale per il Collocamento e la Disoccupazione*), is to be established in the Ministry of Industry, Commerce, and Labor, which will replace the two offices created by the former decrees, i. e., the central employment office and the office which had charge of the distribution of unemployment grants.

The local direction and supervision of the services coming under the administration of the National Office are to be exercised by newly established provincial employment and unemployment commissions (*giunte provinciali per il collocamento e la disoccupazione*), and supervisory commissioners. These commissions will supervise not only all the activities of the authorized employment offices, as was formerly the case, but also the offices which will be established for administering in their districts the provisions relating to unemployment insurance.

So far as the communal organizations for the placing of labor are concerned, the decree does not provide radical changes. In place of disbursing unemployment grants through these employment offices, however, there will be established in each Province an "office for insurance against unemployment," which will be administered by the provincial commission.

Agreements as to wage and working conditions having a general character for a specified labor market, industry, or occupation must through the prefects, mayors, and employers' and workers' organizations be deposited with the employment offices and the labor commissions.

Employers, inclusive of public administrations, who do not directly or through their own representatives hire labor required by them are obligated by the decree to have recourse to the authorized employment offices and must indicate the number of workers required, the

trade or occupation which these are to exercise, and the working and wage conditions offered.

The decree prohibits the operation of employment offices for gain and provides heavy fines for violators of this prohibition.

The placing of workers in employment involving their working in foreign countries is to be effected under the supervision of the Emigration Commission.

Financial Provisions.

Authority is granted in the decree for the inclusion in the budget of the Ministry of Industry, Commerce, and Labor of the sum of 50,000,000 lire (\$9,650,000, par), which may be used by the National Office for placing labor or for making advances to local bodies for combating unemployment.

In addition to the above, a permanent national fund will be provided for placing labor and combating unemployment, which will be made up of the balance remaining from funds already appropriated for this purpose, part of the contributions required in connection with the new compulsory unemployment insurance, and an annuity from the State, which is fixed at 40,000,000 lire (\$7,720,000, par) for the first three years.

Unemployment Insurance.

The decree provides for the establishment in each Province of a general unemployment insurance fund administered by the provincial employment and unemployment commission. Insurance against unemployment through occupational funds established by trade organizations or by agreement of employers and workers is also to be permissible.

Unemployment insurance is made compulsory for all manual workers of both sexes and for those salaried employees whose monthly earnings do not exceed 350 lire (\$67.55, par). All workers under 15 years or over 65 years of age, home workers, domestic servants, and persons permanently employed by public authorities, are exempted.

Beginning with January 1, 1920, the following contributions to the fund against unemployment have been required:

CONTRIBUTIONS PER WORKER TO UNEMPLOYMENT FUND.

[One lira at par equals 19.3 cents.]

Daily earnings.	Contribution.		
	Fortnightly	Weekly.	Daily.
4 lire and less.....	<i>Lire.</i> 0.70	<i>Lire.</i> 0.35	<i>Lire.</i> 0.06
Over 4 lire to 8 lire.....	1.40	.70	.12
Over 8 lire.....	2.10	1.05	.18

One-half of the contribution for each worker is to be paid by the employer and one-half by the worker himself. The employer is held responsible for the payment of the worker's share of the contribution. Unemployed workers are not required to make contributions during the period of their involuntary unemployment.

The new schedule of unemployment grants is a very simple one and is based entirely upon the earnings of the worker. In general it is somewhat higher than the schedule hitherto in effect. The daily grants will be as follows:

Daily earnings.	Daily unemployment benefit.
4 lire and less.....	1.25 lire.
Over 4 lire to 8 lire.....	2.50 lire.
Over 8 lire.....	3.75 lire.

The decree provides that in no case shall the daily unemployment benefit paid exceed one-half of the worker's daily wage.

The payment of the above unemployment benefit is to begin with the eighth day of unemployment, and its maximum duration within one calendar year is limited to 120 days. Unemployment benefits will not be paid for holidays.

The right to receive unemployment grants is confined exclusively to those who are involuntarily unemployed. Seasonal workers are not entitled to receive such grants during off seasons, though such workers may be granted unemployment benefits if they make higher contributions, the amount of which is to be determined in the by-laws of each fund. Unemployment due to labor disputes does not entitle to unemployment grants.

The disbursement of unemployment grants will as a rule be effected through the employment offices and other agencies authorized by the Ministry of Industry, Commerce, and Labor. The post offices may also be authorized to act as disbursing agencies. Occupational funds may through their own agencies effect the disbursing of unemployment grants, but in such case must adopt the rules laid down by the above ministry for a proper accounting.

An unemployed worker must present himself for registration at an employment office on the day following that on which he was discharged, unless he intends to procure work for himself directly, in which case he forfeits the right to receive an unemployment grant until he has presented himself for registration. In such a case he becomes entitled to an unemployment grant five days after his registration, provided that the seven days waiting time have elapsed. Private salaried employees must register with an employment office immediately after having received notice of discharge and without letting elapse the period of notice.

No unemployment grants will be allowed to unemployed workers for whose account at least 24 fortnightly payments, or the equivalent in weekly or daily contributions, have not been made during the two years preceding. When 24, but less than 36, fortnightly contributions have been paid, the worker is entitled to the receipt of an unemployment benefit for 90 days; and when 36 or more fortnightly contributions have been made he may receive the unemployment benefit for the maximum period of 120 days.

An unemployed worker who, without justifiable reasons, refuses suitable employment in his own or a related trade offered him by one of the employment offices, forfeits his right to receive an unemployment grant. Habitual loafers and drunkards are also excluded from the benefits of the decree.

Supervision and Penal Provisions.

The supervision of the application of the decree is to be exercised by the Ministry of Industry, Commerce, and Labor through its National Employment and Unemployment Office, which is authorized to have its officers make inspections of the provincial and trade unemployment funds and all other agencies established for the carrying out of the decree, as well as of the establishments in which persons subject to the decree are employed. Employers refusing to assist the inspectors in their investigations and to furnish data and papers requested by them are liable to a fine not to exceed 1,000 lire (\$193, par).

Employers who fail to make their own contributions and those of their employees and workers are liable to a fine equal to double the amount of the unpaid contributions, but not to exceed 10,000 lire (\$1,930, par), and in addition must pay the delinquent contributions. Persons trying to obtain unemployment grants fraudulently are to be deprived of the benefits of the decree for a period of one year and fined double the amount wrongfully secured by them, without prejudice to their further punishment in accordance with the criminal code.

A special decree of the Ministry of Industry, Commerce, and Labor is to establish rules for the control of actual unemployment, under which employers will keep the Government and the unemployment funds always informed as to the workers included in the insurance and their wages.

Construction of Public Works.

POSITIVE action will be taken by the State toward removing the causes of unemployment by undertaking the immediate construction of public works. The Ministry of Industry, Commerce,

and Labor recently announced that approval has been given to projects involving an expenditure of about 1,300,000,000 lire (\$250,-900,000, par), to be carried out within the next four years, which will include general reclamation work, road construction, post and inland waterway improvement, etc. The most important single line of activity will be that of railway construction, for which it is estimated that 400,000,000 lire (\$77,200,000, par), will be expended during the next four years.

Unemployment Statistics.

THE first issue of *Il Mercato del Lavoro* (The Labor Market), a bulletin published by the Italian National Employment and Unemployment Office, contains two tables showing the extent of unemployment in Italy at the end of each month during the period March to August, 1919, by districts and by industry groups. The table showing the state of unemployment by districts (*regioni*) indicates that unemployment was much more extensive in the northern districts, where most of the Italian industries are located, than in the central and southern districts, which have a pronounced agricultural character. The second table, showing the extent of unemployment by industry groups, is here reproduced:

UNEMPLOYMENT IN ITALY, MARCH TO AUGUST, 1919, BY INDUSTRY GROUPS.

Industry group.	Number of unemployed at the end of the following months of 1919:					
	March.	April.	May.	June.	July.	August.
Mining.....	2,019	3,201	4,592	4,903	3,824	5,734
Rural industries and agriculture.....	13,896	54,988	24,307	17,993	17,713	16,036
Manufacturing industries.....	77,327	92,714	86,036	88,317	89,931	73,958
Metallurgical industries.....	21,198	40,404	32,713	31,304	28,004	23,130
Chemical industries.....	74	556	545	387	1,127	365
Production of motive power, light, and heat.....	266	139	117	152	400	152
Printing industry.....	902	2,059	1,542	1,595	1,645	2,182
Building and road construction.....	131,113	138,913	175,983	168,972	135,071	133,747
Transportation.....	2,826	7,091	8,262	9,142	8,331	9,072
Miscellaneous.....	18,972	55,329	47,200	32,990	40,605	57,704
Total.....	268,593	395,394	1 375,297	1 356,165	1 326,451	322,080

¹ This is the total as shown in the original table; it is not the sum of the items.

According to the table unemployment during the six months ending August 31, 1919, was most extensive in April, the total number of unemployed in that month having been 395,394. In the next four months unemployment steadily decreased. Of all industry groups, building and road construction had the largest number of unemployed. In May, 1919, the unemployed in this industry group numbered 175,983, or approximately 47 per cent of the total number of unemployed. The manufacturing industries had the next largest number of unemployed.

The monthly disbursements of the Government for unemployment grants, February to October, 1919, were the following:

	<i>Lire.</i>		<i>Lire.</i>
February.....	9,795,000	July.....	17,061,600
March.....	8,095,000	August.....	9,803,000
April.....	9,590,000	September.....	9,165,000
May.....	16,733,000	October.....	11,075,000
June.....	15,570,000		

Social Insurance in Switzerland.¹

ACCORDING to a report recently issued by the Swiss Insurance Department there were 74 new insurance funds authorized by the Government during the year 1917. The number of authorized societies in operation at the close of the year was 777, in which 629,927 persons were insured.

The number of men, women, and children insured and the kind of insurance carried is shown in the following table:

NUMBER OF INSURANCE FUNDS IN SWITZERLAND AT THE END OF 1917, BY CLASS OF INSURANCE CARRIED, AND NUMBER OF PERSONS INSURED THEREIN.

Class of insurance carried.	Number of funds.	Number of persons insured.			
		Men.	Women.	Children.	Total.
Medical attention and medicines only.....	46	31,384	52,964	47,612	131,960
Medical attention, medicines, and unemployment benefits.....	478	173,232	88,824	18,089	280,145
Medical attention and medicines (less than provided by law) and unemployment benefits.....	10	7,564	576		8,140
Unemployment benefits alone.....	243	166,859	42,823		209,682
Total.....	777	379,039	185,187	65,701	629,927

These funds vary as to their composition. In some of them membership is limited to an occupation, a religious or political organization, or a business establishment, but in the majority of cases there are no such restrictions. They vary also in regard to the age and sex of persons eligible to membership.

The following table shows the number of men, women, and children in the various classes of funds:

NUMBER OF INSURANCE FUNDS IN SWITZERLAND AT THE END OF 1917, BY COMPOSITION OF FUND, AND NUMBER OF PERSONS INSURED THEREIN.

Composition of fund.	Number of funds.	Number of insured persons.			
		Men.	Women.	Children.	Total.
Children only.....	8	2,278	2,250	10,521	11,049
Men, women, and children.....	208	116,151	105,690	54,802	276,643
Women and children.....	1		162	378	540
Men and women.....	478	221,264	77,504		298,768
Women only.....	5		1,581		1,581
Men only.....	77	41,346			41,346
Total.....	777	379,039	185,187	65,701	629,927

¹ Rapport du Departement Suisse de l'Economie Publique, 1918.

² Insured before reaching 14 years of age, with a right to remain members of the fund until they reach the age of 20 years.

A Federal subsidy is paid annually per member, but not more than once for each member even though the member on whose account it is paid is insured in more than one fund. The membership upon which subsidies were based for the year 1917 was 311,508 men, 164,842 women, and 55,453 children, or 531,803 persons. This subsidy varies with the fund's compensation schemes—whether one or more kinds of compensation are paid, and the amount. The Federal subsidy to those paying only for medical attention and medicines varies from 3.5 to 4.5 francs (67.6 cents to 86.9 cents, par), for unemployment benefits alone from 3.5 to 4.5 francs, while those funds paying both kinds of benefits received from 5 to 5.5 francs (96.5 cents to \$1.06, par) per year per insured person. The subsidies paid in 1917 amounted to 2,399,852.5 francs (\$463,171.53, par). In addition to this the State paid 114,000 francs (\$22,002, par) as maternity benefits, and 87,200 francs (\$16,829.60, par) as benefits to mothers nursing their children.

Of funds in operation on January 1, 1917, the assets of 528 funds had increased 1,526,164 francs (\$294,549.65, par) and of 169 funds had decreased 223,963 francs (\$43,224.86, par) a net increase of 1,302,201 francs (\$251,324.79, par).

Provisions for Unemployment Relief in Switzerland.¹

FROM August 5, 1918, to April 5, 1919, five decrees of an emergency character were issued by the Swiss Federal Council, regulating the grant of assistance to unemployed workers. Two of these related to unemployment in private industry arising out of war conditions, the third to unemployment among workers employed by the Federal Government, the fourth to unemployment of Swiss subjects returning from abroad, while the fifth laid down conditions for the relief of all workers not covered by the preceding measures. These have now been repealed and replaced by a single decree dated October 29, which went into force on November 16, 1919, but which is still to be regarded as a provisional measure, to be replaced ultimately by an unemployment insurance law.

The main lines followed in the granting of unemployment relief, pending the enactment of such a law, may be stated as follows:

Assistance is granted both for total and for partial unemployment, subject to the fulfillment of conditions laid down in the decree. Such assistance is paid by the communal authorities in the former and by employers in the latter case.

¹ Reprinted from British Labor Gazette, Source: Recueil des Lois Suisse, Nov. 5 and 19, and Feuille Fédérale Suisse, Nov. 18, 1919.

The amount of relief granted in case of total unemployment is 60 per cent of the normal earnings, or 70 per cent where the person out of work has others legally dependent upon him; but the daily rate of pay must not in any case exceed certain maximums laid down in the decree. The maximum amount varies according to whether or not there are dependents and also according to the cost of living in the commune in which the unemployed worker resides.² Where short time is worked the relief paid by the employer is equal to half the loss of wage or salary.

Unemployment relief must not be paid, as a rule, for more than 60 working days in any one year.

The cost of relief is covered by grants from the Federal Government, the Cantons, and communes, and by contributions levied upon the employer, either by his trade association (should he belong to one), or by the government of the Canton in which his business is carried on. The share which an individual employer may be called upon to pay will be fixed by his association or by the cantonal authority as the case may be, and will be, (1) in respect of nonmanual workers, an amount which is not less than the total salary bill for half a month and not more than the total salary bill for three months, and (2) in respect of manual workers an amount which is not less than one week's wages bill and not more than the wages bill for six weeks. In computing the amount of the pay roll for the purpose of assessing an employer no account is taken of salary paid to a non-manual worker in excess of 500 francs (\$96.50, par) per month, or of wages to a manual worker in excess of 84 francs (\$16.71, par) per week.

Where the reduction of the working hours resulting in partial unemployment is 40 per cent or under, the cost of relief is borne entirely by the employers; if it is more than 40 per cent the employer will pay one-third of the cost of the relief provided.

Disputes are to be referred to the cantonal conciliation offices or to arbitration boards upon which these offices are represented. Unemployment relief under this decree is not to count as poor relief.

Special arrangements are made to cover the case of unemployment relief for aliens domiciled in Switzerland and for workers in seasonal trades.

The Federal Department of Public Economy is authorized to dispense with certain provisions of this decree in the case of certain classes of undertakings in which no unemployment exists or where there are organizations granting benefits equivalent to those conferred by the present measure.

² Communes are divided into three classes, viz.: "dear," "moderately dear," and "relatively cheap." In the second of these, for example, a person out of work may not receive more than 5 francs [96.5 cents, par] per day, or, if he has dependents, 7½, 8, 8½ or 9 francs [\$1.45, \$1.54, \$1.64, or \$1.74, par], according to their number, with an additional 50 centimes [9.7 cents, par], for each dependent in excess of four.

Regulations for the carrying out of the decree were issued on November 10. These show that an unemployment office is to be set up in each commune, and that where possible the duties of such office are to devolve upon the public employment exchange.

State Assistance for the Unemployed in Poland.

ACCORDING to the British Labor Gazette for February (p. 64), the Polish Official Gazette for November, 1919, contains the text of a temporary Government measure which provides the following immediate arrangements in aid of the unemployed pending the passing of a law dealing with this subject:

Able-bodied workers of either sex in trade, commerce, or transport who, through no fault of their own, are out of work, are entitled to State assistance, to be administered by the district unemployed assistance commission under the control of the Ministry of Labor and Public Welfare. One-half of the membership of the above commission will be composed of workers' representatives. The rate of daily assistance to be given varies according to the population of the locality. Where the population is less than 50,000 it will be 4 marks for the head of the family, with 2 marks for his wife (if she is not earning a separate wage), and 1 mark for each dependent child, the total not to exceed 10 marks a day; in places with 50,000 inhabitants or more and in all industrial centers the daily allowance is 5 marks for the head of the family, 3 marks for a worker's wife not earning money independently, and 1 mark for each dependent child, the total not exceeding 12 marks a day. This donation may be in kind. It is to begin within 14 days after the unemployed worker has been registered in the labor office, the maximum number of weekly donations in any one year being 13, though in exceptional cases it may be 17.

The donation will be forfeited if the applicant has ceased work for inadequate reasons; if he has obtained work for at least a fortnight; if he has made a false statement in his application; if he fails to comply with certain regulations; and finally, if he declines to accept work in establishments not affected by a strike or boycott, at trade-union rates, or at current local rates, when such work is offered to him by the labor office.

LABOR LAWS AND REGULATIONS.

Legislation as to Rehabilitation of Injured Workers.

By LINDLEY D. CLARK.

AN INDUSTRIAL result of the Great War was the maiming or otherwise disabling of large numbers of men drawn from the ranks of the workers of the country. To minify this loss, and to save the injured man from a life of dependence and consequent loss of self-respect, Congress, in common with other national legislatures, passed a law (June 27, 1918, 40 Stat. 617), entitled the Vocational Rehabilitation Act. (See MONTHLY LABOR REVIEW, July, 1918, p. 29.) The purpose of this act is to provide for the retraining of disabled persons discharged from the military or naval forces of the United States, and their "placement in suitable or gainful occupations."

The subject of equipping and retraining men injured in industry and disabled to pursue their former vocations had been discussed by those interested in social welfare for a number of years, and attention had been directed to the notable results attained in some European countries. However, it seemed to require a special impetus to secure public effort and action, and this the war has evidently afforded. First to act was the State of Massachusetts, which by a statute of 1918 (chap. 231, approved May 28) created a division in its industrial accident board, with the duty of training and instructing persons incapacitated for earning a livelihood through industrial accident.¹ The benefits of the act are limited to persons who were residents of the State at the time of becoming incapacitated.

A previous act (chap. 230), approved the same day, made corresponding provision for soldiers and sailors in the then current war disabled or diseased in the service. Both acts contemplate cooperation with the Federal Government in any way available and approved by the State agencies intrusted with carrying out their provisions. The machinery provided for in the first act is an advisory board consisting of the commissioner of education, the surgeon general, and others, ex officio, including the chairman of the industrial accident board, and nine other persons appointed by the governor.

¹ Other States taking similar action are California (chap. 183, May 2, 1919), Illinois (act of June 28, 1919), Minnesota (chap. 365, Apr. 23, 1919), Nevada (chap. 132, Mar. 28, 1919), New Jersey (chap. 74, Apr. 10, 1919), North Dakota (chap. 162, Mar. 5, 1919), Oregon (chap. 435, Mar. 4, 1919), Pennsylvania (No. 418, July 18, 1919), and Rhode Island (chap. 1737, Apr. 19, 1919), and Virginia (1920).

The enforcement of the industrial law is placed in the hands of the newly formed division of the industrial accident board without suggestion of methods or limitation on procedure, but it "may act in such manner as it may deem necessary to accomplish the purposes of the act." The division is charged not only with the duty of training the injured worker, but also with securing him employment.

Considerable variety is shown in the nature and scope of the various laws. Some of them are administered as a part of the workmen's compensation system of the State, and are in the hands of the State accident commission or board. Thus, in California where a fatal injury occurs and there is no surviving beneficiary the sum of \$350 is to be paid into an industrial rehabilitation fund. This fund is to be used by the industrial accident commission to promote vocational education and rehabilitation. An act (chap. 418) of this same legislature (1919) that may be mentioned in this connection appropriated \$8,500 for the treatment and rehabilitation of men rejected for military service during the war on account of physical defects.

In North Dakota the only provision made is contained in a section of the workmen's compensation act. The bureau in charge is to undertake "to restore to industry those injured in the course of employment." To this end it may assist the industrial cripples to obtain training, education, and employment, and may cooperate with the Federal Board for Vocational Education for this purpose.

The Oregon statute is somewhat broader than the foregoing, since it provides for the care and reconstruction of workmen injured in industrial pursuits, and also that the funds appropriated may be used "for such other purposes as may be deemed advisable by the commission." The work is intrusted to the industrial accident commission, which is authorized to set aside from the industrial accident fund the sum of \$400,000 to construct and equip an industrial and reconstruction hospital.

Liberal Provisions in New Jersey Law.

TO New Jersey must be given the credit of enacting the most liberal law of this type up to the date of its approval. The New Jersey act provides for a commission consisting of the commissioners of education, labor, and charities and corrections, with three nonsalaried commissioners appointed by the governor. One of these last is to represent employers, and one, organized labor. It is the duty of this commission to seek to train and qualify for remunerative employment every "disabled person in the State, resident therein for one year or more, whether his disqualification is due to accident, disease, or congenital defect." Excluded from the operations of the law are the aged and infirm, blind or deaf persons

under the care of the State, epileptics, feeble-minded persons, and those not susceptible to rehabilitation. The work is to be immediately in the hands of a director to be appointed by the commission, who shall himself employ the necessary staff and special assistants. Reports of disabled persons are to be obtained through public and private hospitals and from the commissioner of labor, who receives accident reports. Applications will also be received from persons desiring training, and a survey of the State is to be made to discover persons requiring assistance of this kind. Arrangements may be made with suitable institutions for the treatment of disabled persons, and they may be furnished artificial limbs and orthopedic appliances at cost and on easy payments. A school of rehabilitation is to be established in a principal city, with branches at other places thought necessary. Arrangements for suitable education and training may be made also with local school authorities and educational institutions, and with commercial, industrial, or agricultural establishments. Recipients of such training may be maintained during the period of training at an expense of not over \$10 per week for 20 weeks, though the length of time may be extended in the discretion of the commission. No person is to be trained against his or her will. Cooperation with the department of labor in the matter of placements and with the State or Federal Government or any private agencies for the carrying out of the purpose of the act is provided for.

The Illinois Legislature enacted in June, 1919, a law practically identical with the New Jersey law, while the Pennsylvania Assembly enacted similar legislation in July. The Illinois law provides for its administration by the department of public welfare, its scope and methods being practically as in the State of New Jersey. In Pennsylvania the law is intrusted to a bureau of rehabilitation to be created in the department of labor and industry, whose chief is charged with the duty of directing the rehabilitation of residents of Pennsylvania whose capacity to earn a living is in any way destroyed or impaired through industrial accidents in the State. The scope of the act is therefore much more limited than is the case in New Jersey and Illinois, but its methods of procedure are much the same as laid down in the New Jersey act; however, artificial limbs and appliances may be furnished gratis, and the maintenance fund may be as high as \$15 weekly, the law in these two points being more liberal than in New Jersey and Illinois.

In Minnesota ² the work of rehabilitation is intrusted to a division of the State board of vocational education. The beneficiaries are to be those whose capacity to earn a living has been impaired or destroyed

² An account of the Minnesota plan was published in the MONTHLY LABOR REVIEW for January, 1920 (pp. 184-189).

"through industrial accident or otherwise," and who are residents or citizens of Minnesota. Cooperation with the administration of the compensation act is authorized, as well as with Federal agencies. Courses of education and training may be established, or the board may cooperate with local boards of education in establishing and maintaining suitable courses, as may be deemed most expedient in carrying out the purposes of the act. The board is also to seek to obtain employment for the persons trained.

Quite similar to the foregoing are the provisions of the Rhode Island statute, in which the commissioner of public schools is authorized to make any industrial cripple resident in the State, injured in employment therein, and a fit subject for rehabilitation and education, a State beneficiary. Such person may be trained in any suitable school or institution at the expense of the State for not more than one year, though in approved cases this term may be extended. Artificial limbs may be furnished wholly or partly free of charge or at cost on installment payments.

The Nevada statute takes no initiative, but appropriates \$10,000 for the use of the State board of education in cooperating with any activity of the United States "for the promotion of vocational rehabilitation of persons disabled in industry or otherwise, and their return to safe employment." The instruction may be carried on within the State, or in other States with the approval of the governor in writing.

Rehabilitation Law of Virginia.

THE Legislature of Virginia at its session just closed enacted a law providing for the vocational training and rehabilitation of employees coming under the provisions of the State workmen's compensation act. The law applies to those whose capacity to earn a living has been destroyed or greatly impaired as a result of an industrial accident and who apply for the training contemplated. A condition is that the applicant must be without sufficient means to provide for his own rehabilitation, and preference is to be given to those whose disabilities are greatest and who were residents of the State at the time of the injury. If the commission thinks the applicant a fit subject for the training in view, he may be appointed a beneficiary at any suitable institution or school, either within or without the State, for a period of not more than one year; but if the institution especially recommends a longer period and the governor approves, an extension may be made not to exceed six months.

When an earning capacity equal to that prior to the injury has been regained no further compensation awards shall be paid except those under the schedule for specific injuries; and if more than 50 per cent of the average prior wage can be earned, a readjustment

shall be made, subject to the same limitation. The sum of \$10,000 is provided to carry out the act, to be taken from the surplus amounts standing to the credit of the administrative fund. If at any time these credits are not adequate, appropriations are to be made. The commission may accept gifts, etc., for this work and is authorized to cooperate with the Federal Government in any work of a similar nature.

No Federal statute on the subject is yet in being, though the Senate passed a bill, June 21, 1919, providing for cooperation with the States in the vocational rehabilitation of persons disabled in industries and otherwise. The House passed a similar measure October 17, 1919, which it sent to the Senate. The Senate committee to which it was referred proposed to amend the House bill by substituting the Senate measure for its provisions, and such action was taken on April 12, 1920, and a conference with the House requested.

It can not escape notice that there is considerable range in the liberality of the provisions of the various acts. The laws of California, North Dakota, and Oregon are closely tied up with the accident funds of their respective States, while in the first two States there is also a strict limitation to industrial injuries. In New Jersey and Illinois, on the other hand, a much broader problem is recognized, and a duty is assumed with regard to citizens and residents physically subnormal, regardless of the origin of their disability. Admitting the desirability and effectiveness of rehabilitation work for any group of citizens, it is difficult to discriminate against any other group likewise exposed to the possibility of becoming a public charge but capable of being made self-supporting and self-respecting. There is a commendable absence of limits to the discretion of the administrative authorities as to the methods to be pursued and the instrumentalities of which they may make use. The whole subject is in an experimental stage; but there are ample financial provisions in most States, and a variety of methods and conditions sufficient to afford a thorough test of the possibilities of such an undertaking.

Retirement Law for Railroad Employees in Argentina.¹

A LAW providing for a national retirement and pension fund for employees on Government-controlled railroads was passed in Argentina April 16, 1919, the various provisions of the law to become effective three months after its promulgation. This law, which superseded all previous laws, provided for a census of the

¹ Boletín del Instituto de Reformas Sociales, Madrid, August, 1919, pp. 243-247; September, 1919, pp. 338-345.

employees included in its provisions and for a mathematical study on an actuarial basis within the first three years of its going into effect for the purpose of making such modifications as might seem to be advisable.

Purpose and Beneficiaries.

THE employees subject to the operation of the law include all those employed on Government-owned railroads, including the posts now in existence or those which may be established, either by public or private enterprises, in the future, and also employees of the cable road from Chilecito to Mejicana, as well as employees of confectioners' shops operated by concessionaires of the railroads. The pensions also apply to persons who were discharged prior to January 1, 1913, except those discharged for certain specified causes such as drunkenness, dereliction of duty, crimes, etc., and to beneficiaries of deceased employees who prior to the same date would have been entitled to a pension. Employees or laborers engaged in temporary or casual work are not included. Six months' continuous service determines an employee as permanent.

Administration of the Fund.

A DIRECTORATE formed of a president appointed by the President and confirmed by the Senate, and three representatives each of the railroads and the employees, has charge of the administration of the fund. In case of a tie the president has the deciding vote. He also has charge of the execution of orders and is the legal representative of the committee, though he does not have the power of appointment or removal of other members. The directorate is required to determine annually the amount of the budget necessary for the following year and to submit the estimate to the President for approval.

Capital of the Fund.

THE revenue for the fund is derived from contributions of the employees and of the employers, from fines, from donations and legacies, and from the interest on accumulated capital. The employees are required to pay 5 per cent, deducted from their wages, on all earnings or wages up to 1,000 pesos (\$424.60, par) per month, to pay the amount of the first month's salary in 24 monthly installments when first employed by a railroad enterprise, and to pay the difference between the first month's pay and the higher pay when receiving an increase in wages. The employers are required to make a monthly contribution equal to 8 per cent of the salaries and daily wages provided that they do not exceed 1,000 pesos monthly. The excess of earnings above 1,000 pesos is not considered. The

railroads are required to make the discounts from the employees' wages and deposit them, together with their own contributions, each month in the National Bank of Argentina. The entire capital of the fund, except what is necessary for current expenses, is to be invested in national interest-bearing bonds or similar securities.

Amounts of Pensions.

THE pensions cover compulsory and voluntary retirement and invalidity. For compulsory retirement pensions are calculated on the average earnings of the last five years of service. Ninety-five per cent is allowed on earnings up to 100 pesos (\$42.46, par), 80 per cent on earnings between 100 and 300 pesos (\$42.46 and \$127.38, par), and 70 per cent on earnings between 300 and 1,000 pesos (\$127.38 and \$424.60, par). To receive this pension the employee must have completed 30 years of service and be at least 50 years old, and for an employee who has served 30 years but is between the ages of 45 and 50 the pension is reduced one-fourth.

Invalidity pensions are calculated on the average earnings of the last 10 years before retirement on the same scale as the ordinary retirement pension, less a reduction of 5 per cent for each year of service less than 30. This pension is paid to employees having at least 10 years' service to their credit, whatever the cause of disability, and to employees of less than that number of years' service if disability is incurred in the course of their employment.

Voluntary retirement is allowed to employees who have been employed more than 10 years and have reached the age of 50, at the rate of 2 per cent of the ordinary retirement pension for each year of service, and to those 50 years old having less than 10 years' service who wish to retire the amount paid in by them to the fund is returned with 5 per cent compound interest.

Employees who are discharged through no fault of their own receive the amount they have paid into the fund without interest. Such employees may be reinstated in membership in the fund within three years by payment of the sums previously withdrawn, although certain groups covered by a previous law lose this right in two years after the promulgation of the present law.

Those employees who have obtained the ordinary retirement pension may return to the railroad service and if again retired shall receive the pension formerly paid, while those retired for invalidity may be reemployed on easier work and shall receive pensions proportionate to their diminished earnings. If such employees complete the years of service which entitle them to ordinary retirement pensions, they will receive these pensions in addition to the invalidity pensions which are already being received.

If an employee, discharged for causes which forfeit the return of his contributions to the fund, has a family dependent upon him, the pension is to be paid to them.

Pensions are for life except for causes which lead to forfeiture, and for removal to another country, unless permission for such removal is obtained from Congress.

Pensions to Dependents; Special Provisions.

WHEN death occurs to an employee or laborer entitled to a pension, the persons dependent on such an employee, including the widow or the widower suffering from disability, the children, or in default of them the parents or the unmarried sisters of the principal, are entitled to receive one-half of the pension to which the principal was entitled, upon furnishing proof of the validity of their claims.

Employees of the railroads entitled to pensions prior to the date on which the compulsory discount became effective are subject to a discount of 10 per cent on their pensions until the fund shall have been reimbursed to the amount which the discounts on their salaries would have reached. This provision applies also to persons discharged prior to January 1, 1913, who had not forfeited their rights to a pension and to the heirs of persons eligible to a pension who had died before this date.

Arrangements are made for allowing persons formerly employed by private railroads to be given credit for such service in computing their service records for pensions. Provision is also made for supervision of reports of the railroad companies and for prompt payment by them of the sums required, with fines for failure to pay or delay in complying with these requirements. Power for enforcement of these provisions is vested in the president of the directorate of the fund.

Regulations Governing Application of Eight-Hour Law in Poland.

UNDER the provisions of the Polish eight-hour law of November 23, 1918, noted in the MONTHLY LABOR REVIEW for March, 1920 (p. 195), the minister of labor and public welfare is authorized to issue regulations pertaining to the enforcement of the law. Such regulations were published on January 9, 1920, and are summarized in the British Labor Gazette for February (p. 64), as follows:

The regulations limit working hours to 8 per day (on Saturdays to 6) or 46 per week. This limitation is to apply to persons employed in manufactories, mining, commerce,

communication and transport, and in other establishments where work is performed, even if such undertakings are not carried on for profit, or if they belong to the State. In mining the legal working hours are "from bank to bank." The rules of each mine must state clearly the order in which the arrival and departure of the men shall take place. The working hours of transport workers may be regulated by a special order, and in factories belonging to the State working hours may be rearranged by the competent minister, after he has consulted the trade organizations of employers and work-people, but the total hours worked must not exceed the legal number. Overtime is permitted to be worked in the following cases: (a) Where extra work is necessary in order to prevent damage, or for other similar reasons; (b) at times of seasonal pressure or at periods of stock taking; (c) in factories where continuous processes are carried on; and (d) in cases of national necessity.

For overtime not exceeding two hours payment is to be made at the rate of time and a half, for each hour in excess of two hours and for night work (i. e., between 9 p. m. and 4 a. m.) and work on Sundays and holidays the rate of pay is to be double. Work on Sundays is permitted only in public services, hotels, drug stores, etc., in theaters and the like, and in establishments carrying on continuous processes.

After every 6 hours of work, an hour's rest is to be granted, during which the machinery is to be stopped, and the worker permitted to leave his place of work. Where, owing to the nature of the work, this is not practicable, the worker is to be afforded an opportunity to take his meal while the machinery is running.

A temporary regulation provides that the introduction of shorter hours is not to cause a reduction of earnings where longer hours have hitherto been worked.

Nonobservance of the regulations is punishable by fine up to 5,000 Polish marks, or imprisonment for three months.

The regulations came into force four weeks after their publication.

Code of Labor Laws of Soviet Russia.

THE issue of "Soviet Russia," the official organ of the Russian Soviet Bureau located in New York City, dated February 21, 1920, reproduces a code of laws enacted for the regulation of labor under the Soviet Government. The code applies to all persons receiving remuneration for their work and is binding upon all enterprises, institutions, and establishments, public or private, as well as private employers. Cooperative workers, workers in communal enterprises, farmers, and independent artisans are subject to other forms of regulation.

Labor Compulsory.—The first article of the code relates to compulsory labor. All citizens of the republic are subject to compulsory labor except those under 16 and over 50 years of age, and those who have become incapacitated by injury or illness. Temporary exemptions are made in case of persons temporarily disabled and of women for eight weeks before and eight weeks after childbirth. Questions of permanent and temporary disability require medical certification.

Labor may be rendered in the form of organized cooperation, individual personal service, or individual special jobs.

The conditions of labor are to be regulated by rules drawn up by the trade-unions in agreement with the directors or owners of establishments or enterprises, and approved by the People's Commissariat of Labor. Individual personal service or special jobs are subject to trade-union rules to be approved by the commissariat.

Right to Employment.—The second article declares that all citizens able to work have the right to employment at their vocations and for remuneration fixed for such classes of work. This right belongs first to workers subject to compulsory labor. Persons over 50 come next, while persons under 16, those incapacitated by injury or illness, and women given vacations on account of childbirth are barred. No female and no male under 18 shall have the right to work at night or at especially hard or dangerous occupations.

Labor Distribution.—Article 3 takes up the subject of the methods of labor distribution. Departments of labor distribution, trade-unions, and all institutions of the Republic are to cooperate in enforcing the right to work; while the assignment of wage earners to work is to be carried out through the departments of labor distribution. Only these departments may summon a wage earner to work unless he be chosen for a position by a Soviet institution or enterprise. A system of election is provided where special qualifications are required.

Unemployed wage earners are required to register in the local department of labor distribution to which application is to be made by those in need of workers. Persons meeting the requirements of the employment shall be assigned to work, and may not refuse the same if the working conditions conform to the standard fixed by the proper authorities. If the local list does not contain a suitable supply of workers, application must be made to the district bureau, and if this is found deficient, workmen of a class most nearly approaching the requirements of the trade may be sent, upon agreement with the proper trade-union. A workman offered work outside of his vocation is obliged to accept it on the understanding, if he so wishes, that it is only temporary until he can secure work at his vocation. If the employment is outside the district of the worker's residence, the number shall be made up from volunteers, if possible; otherwise, unemployed workers shall be assigned in the order of their registration.

Probation Periods.—Acceptance for permanent employment requires a period of probation of not more than six days, though in Soviet institutions the probation period shall be two weeks for unskilled and less responsible work, and one month for skilled and responsible work. Report is to be made to the department of labor distribution as to the acceptance or rejection of the worker, who retains his place on the list of unemployed until the expiration of the probation

period. A rejected worker may appeal to the trade-union of which he is a member, which may then negotiate with the employer. If the negotiations fail, the matter shall be submitted to the local department of labor, which makes a final decision. If the rejection seems to the department to have been without sufficient reason, the employer must furnish the workman with work, and may also be required to pay for time lost.

Transfer and Discharge of Wage Earners.—Article 5 relates to the transfer and discharge of wage earners. Transfers may be made only by decision of the proper organs of management, and if it involves a shift to another enterprise or establishment, the consent of the department of labor distribution must be obtained. Appeals may be taken to the district department of labor or to the People's Commissariat of Labor whose decision is final. These last-named agencies may, in agreement with the respective professional unions, transfer a whole group of wage earners in cases of urgent public work, either in the same or a different locality, if a sufficient number of volunteers can not be found.

Discharges may take place only in case employers go out of business or certain orders of work are canceled, or if work is suspended for more than a month, or in case of the completion of a temporary contract, or where there is an evident unfitness for the work as determined upon by the organs of management in agreement with the proper union, or, finally, by request of the wage earner. Two weeks' notice is required, except in cases of termination of temporary employment or where the wage earners request release. Appeals may be taken in case of discharge, first to the local department of labor and, finally, to the district department, whose decision is final. Discharges by request of the wage earner must be passed upon by the proper works or other committee representing the workmen's self-government system. If these find the resignation unjustified, the worker must remain at work, but may appeal to his union.

Remuneration of Labor.—The remuneration of labor is considered in article 6. It is directed that remuneration of all paid labor and the detailed conditions and order of payment shall be fixed by tariffs worked out for each kind of labor by the Soviet authorities, the trade-union, and the People's Commissariat, in agreement with the directors and owners of establishments and enterprises. The standard shall at least cover the minimum living expenses as determined for each district by the People's Commissariat of Labor. The character of the labor, its dangers, complexity, the degree of independence and responsibility involved, as well as standard of education and experience required, shall be considered in fixing wages. The daily rate shall be the standard, and piecework shall be compensated according

to the number of pieces determined to constitute the production standard. Overtime work shall be remunerated at a rate not exceeding time and a half, and, excepting such excess, no additional pay above the standard fixed shall be permitted in any form or under any pretext. Payments for steady work must be made periodically, at least once in every fortnight, and no payment may be made in advance. Payments in kind may be made only on special permission. Wages must be paid during working hours, at the place of work, and only for actual work done. The payment of wages is continued during leaves of absence, illness, and unemployment; but in the two latter cases payment is made from special funds.

Hours of Labor.—Working hours are regulated by the same bodies as those fixing wages. Eight hours is the maximum for a normal working day, and seven hours for night work. Persons under 18, and those employed at specially difficult or dangerous employment, may not work more than six hours per day. As a general rule, overtime work shall not be permitted, and in no case shall females or males under 18 do overtime work. An uninterrupted rest of 42 hours must be allowed each week, and, if the working day exceeds six hours, it shall be reduced by two on the day preceding rest days. Workers who have been engaged without interruption for not less than six months shall be allowed two weeks' leave with pay, and if for one year, one month's leave with pay. A wage earner shall not be allowed to work for remuneration during his leave of absence.

Efficiency of Labor.—The eighth article establishes methods to assure efficiency of labor. A standard output for normal working conditions is required of all workers, this standard to be determined by commissions of the representative trade-unions and approved by the proper department of labor jointly with the Council of National Economy. A worker falling below the standard may be reduced to a lower group at a lower rate of wages; or, if his failure is due to lack of good faith and negligence, he may be discharged without the prescribed two weeks' notice. Rules of internal management must also be drawn up by the Soviet authority for Soviet institutions, and by the trade-unions for other undertakings, to be approved by State authorities in both cases.

Safety Regulations.—The concluding article considers safety regulations. The protection of life and health lies with technical inspectors and the representatives of sanitary inspection. Labor inspectors are to be elected by the councils of professional unions, and are under the jurisdiction of the People's Commissariat of Labor and its local branches (departments of labor). The inspectors have full authority to enter establishments and all buildings provided for the workmen, to examine books, and to secure cooperation of representatives of

both employers and employees. They are to enforce the provisions of this code and all orders, instructions, etc., of the Soviet Bureau intended to safeguard the life and health of the workers. They may also adopt special measures to meet special dangerous conditions.

Appendixes.—Appendixes provide rules concerning the unemployed and the payment of subsidies, concerning labor booklets, and for the determination of disabilities for work. Unemployed persons are to receive the remuneration paid to their class under the findings of the authorities, but must submit evidence as to their status, and the extent and causes of their unemployment must be ascertained through the department of labor distribution. Payments are to be made from an unemployment insurance fund levied on all enterprises employing paid labor, including fines imposed for default in the payment of such levies, and any casual amounts accruing.

Every citizen of the Republic on being assigned to his labor group and category is to receive a labor booklet or pass book, a copy of which is also to be kept by his employer. This book must be presented to his employer on entering any employment, and all payments, fines, absences, etc., must be entered therein. This book must be held open to inspection of the authorities as well as of his employer and his trade-union.

Disability for work shall be determined by a bureau of medical experts in urban districts; or by provincial insurance offices, accident insurance offices, and institutions acting as such. Surgeons, officials, mechanical engineers, and trade-unions are to be represented on the staff of the bureau of experts. Reexaminations may be had to determine changes of conditions. Sick benefits shall be the same as the wages payable to the group to which the wage earners belong. Payments are to be made from hospital funds sustained by enterprises employing paid labor.

The absolutely dominating nature of these regulations is shown by the following preliminary article:

IV. All labor agreements previously entered into, as well as all those which will be entered into in the future, in so far as they contradict the regulations of this code, shall not be considered valid or obligatory, either for the employees or the employers.

HOUSING.

Company Housing in the Bituminous Coal Fields.

By LEIFUR MAGNUSSON.

IN THE latter part of 1916 the Bureau of Labor Statistics completed a comprehensive survey of housing by employers in the United States. This investigation comprised communities maintained by coal mining companies in Western Pennsylvania, West Virginia, Ohio, Indiana, Kentucky, Tennessee, Alabama, Colorado, and Wyoming, and included almost exclusively the better types of communities. Certain facts stand out as a result of this study:

1. The responsibility for the housing of a large proportion of the miners has been undertaken by the mine operators. The isolation of the average mining town, its dependence upon the one industry of mining, and frequently its impermanence and almost universal lack of local self-government, as well as the shifting character of the labor force, have compelled the mine owner to assume that responsibility.

2. The average company mining town has few of the amenities of ordinary community life. There is a dull uniformity in the appearance of the houses and an absence of trees and natural vegetation. Streets and alleys are open dirt roads almost without exception. Sidewalks are very rare.

3. The miner's house is without the ordinary inside conveniences found in the house of the city worker. Less than 2 per cent of the homes in the bituminous coal regions have inside toilets, and running water is rare. Stoves and grates are depended upon for heating.

4. The average house of the miner includes about four rooms, in which he must accommodate a family and frequently take in boarders when there is a housing shortage.

5. The rents of the miners' houses are comparatively low, most of them (12,343 out of 18,877, or 65.4 per cent) renting in 1916 for less than \$8 per month. The rent in some instances probably constitutes a subsidy to the wages of the miner who lives in a company house. (What proportion of all bituminous coal miners live in company houses is not known.)

Scope of Survey.

THE survey was in no sense a census of the coal companies with respect to their practice in housing their employees. Observation, however, convinced the investigator that the practice of company housing was very widespread and uniform among the coal-mining companies.

The scope of the survey in the bituminous-coal region is indicated in Table 1.

TABLE 1.—SCOPE OF THE HOUSING INVESTIGATION IN THE BITUMINOUS COAL FIELDS.

² Not including 1 company with 500 employees; number housed was not reported.

Layout of Towns and Surroundings of the Houses.

THE chief characteristic of every company mining town is its uniformity, due to a tendency to erect houses of similar plan and type and to arrange them along rectangular lines of survey. Another feature of the mining town has been its disregard of the advantages of planting trees, grass, and shrubbery as beautifying elements.

On the other hand, the mining town is characterized by relatively wide streets and ample lots. The streets are usually unpaved, open dirt roads. Sidewalks are extremely infrequent and only in the better parts of the community is there evidence of fenced and grassed courts.

The desirability of locating the houses near to the mines has frequently been secured at the sacrifice of conditions of health and comfort; thus in the coking region the houses are found placed on neighboring hillsides which have been rendered barren by the noxious gases of the beehive ovens. Frequently the towns were found placed not only immediately adjoining the ovens, but with no consideration as to the prevailing winds in the region. With the prevailing winds from the west, houses to the east would be constantly enveloped in smoke. Consequently conditions of dreariness and desolation were quite common in the region. On the other hand, some operators pointed out that because of improved means of communication nearness to the mines is not as essential now as it was formerly. This is particularly true in the bituminous region of Pennsylvania, where the district is fairly closely settled. Workers in the bituminous coal region of Pennsylvania commute from neighboring cities as far

FIG. 1.—One of the better maintained coal towns in West Virginia.

FIG. 2.—A desolate section of a Pennsylvania coke town.

FIG. 3.—Better section of the same town.

as 7 miles away. Isolated "patches" in the region still exist by reason of pure inertia, as one of the more far-seeing managers remarked. It is unfortunate that the scattered locations of formerly individually owned mines were not consolidated into a single town with developed community life at the same time that the mines came under a single corporation control.

Age of the Houses.

WHILE three-fifths (8,024, or 61 per cent of a total of 13,158 reported) of the dwellings in the bituminous coal regions were erected between the years 1901 and 1910, a few houses may be found still in use which were erected before 1881. The type or style of house used in the bituminous coal region of western Pennsylvania has changed very little from what it was in the early days of coal mining.

Type, Construction, and Size of Houses.¹

THERE are two prevailing types of houses found in the bituminous coal regions, the single or detached house and the double or semidetached house, though a few row houses are found in the Pennsylvania and West Virginia and the Colorado and Wyoming districts.

The prevailing plan of house in the Birmingham district is a hip-roofed cottage about 28 feet square with a chimney in the center of the roof, a front porch running the full length of the house, and a small porch at the rear. The houses are generally raised from the ground by brick piers 4 or 5 feet high, the area under the house being usually uninclosed. In the Tennessee and Kentucky coal fields small gable-roof cottages prevail. These, too, are generally without cellars; front and rear porches are common.

A type of house more or less peculiar to all small southern towns is the so-called "shotgun" house, shaped like an oblong box and divided into three rooms in a row and frequently with the doors connecting the rooms in alignment.

An interesting, though perhaps undesirable, arrangement was noted in one of several camps of a company in the Colorado district, whereby two three-room semidetached houses can be made three dwellings. The front porch has no partition, but the back porches are separate. The front rooms of the two houses are connected by a door. In the event of its being necessary to house three families in the building, one family will be given these two front rooms and the front porch, and the others will each have a middle and a back room and a back porch.

¹ In addition to the illustrations here shown, illustrations of types of houses and communities in the bituminous regions of western Pennsylvania and Ohio and in the Birmingham (Ala.) district may be seen in the November, 1917, issue of the MONTHLY LABOR REVIEW following page 56.

Most of the company houses are of wood, the exterior being clapboard, weatherboard, or siding. Some of the old-fashioned board and batten houses consisting of only one thickness of board were still in use in some of the more isolated communities. In the ordinary miner's house in the Pennsylvania and West Virginia region there is no undersheathing, the clapboard being laid directly on the framing. In the Colorado and Wyoming district the large company studied reported that of the houses in its 12 camps about 74 per cent are frame (5 out of 6 being weatherboarded), about 10 per cent plain cement blocks, and about 17 per cent pebble-dash finish. The monotony of the gray cement or pebble-dash is pleasantly relieved by roofs of contrasting and varied colors.

Though a considerable number of the houses of the miners are plastered, an equally large number are ceiled inside with so-called tongue-and-groove material, often left unstained. If they are papered it is usually at the expense of the tenant. The inside wood finish is of pine and usually painted. Almost without exception the houses of the Pennsylvania and West Virginia and of the Ohio and Indiana regions are heated by stoves or grates. In the former district, better-class houses for superintendents and foremen are plastered and papered, and very frequently furnace heated or heated by steam from the company plant.

A feature of the mining towns, particularly of the Pennsylvania and West Virginia and Alabama districts, is the monotony of color in the painting of the houses, all of the dwellings in many towns being exactly alike in this respect. Often, too, they need paint badly. Some rather quaint whitewashed cottages are found in the mining towns of Tennessee.

Size of Dwellings.

CONSIDERABLE variations exist as between the different industry groups and the different sections of the country. The prevailing size of dwelling for a family in the Pennsylvania and West Virginia bituminous coal region is either three or four rooms; in the Ohio and Indiana coal region, four rooms; in Alabama, Tennessee, and Kentucky, three or four rooms; and in the coal towns of Colorado and Wyoming, four rooms. A considerable proportion of two-room houses is found in the bituminous coal regions of Alabama, Tennessee, and Kentucky. In the anthracite coal region the typical company house is of five or six rooms.

The per cent of company houses in the soft-coal fields having each specified number of rooms per dwelling is shown in Table 2. For purpose of comparison similar information covering other mining districts is also given.

FIG. 4.—An old-style board and batten 3-room miner's cottage still in use in an isolated mining town of Pennsylvania.

FIG. 5.—Improved alley in coal and coke town in western Pennsylvania. Note drainage gutter with garbage receptacles over it.

FIG. 6.—New coal mining camp, Birmingham (Ala.) district, constructed in 1916. Houses built before grading and laying of streets. All cottages of similar plan and adapted for conversion into double houses. Used as 1-family 4-room houses. Running water in kitchen; electric light. Coiled inside; composition roof.

Sanitary Conveniences.

SANITARY conveniences are rarely found in mining towns. Thus in the soft-coal regions, only 312 dwellings, or 1.9 per cent of the 16,896 reported, have inside toilets, while 16,584, or 98.1 per cent, have outside toilets. In the more thickly settled anthracite region 19.5 per cent have inside toilets and 80.5 per cent outside. More detailed figures for the various regions are shown in Table 3. Here, again, certain other large mining industries are included for purposes of comparison.

TABLE 3.—NUMBER AND PER CENT OF COMPANY DWELLINGS HAVING INSIDE AND OUTSIDE TOILETS, BY INDUSTRY AND DISTRICT.

Maintenance of Company Houses.

THERE is an absence of careful maintenance in company controlled mining towns, except in a few striking instances. There was no garbage collection or provision made for garbage disposal in 13 of 53 communities. Ten companies reported collecting garbage in the community bimonthly or less frequently.

Where only outside sanitation was provided the prevailing type of privy was the open-vault kind. In one of the towns of the Birmingham district, operated by one of the largest companies in the region, the can type of privy has been adopted quite generally. This company also protects its outhouses by screening and disposes of the contents by a system of water decomposition.

In the coal-mining region of Pennsylvania, both bituminous and anthracite, the old-fashioned method of scavenging prevails. Only in rare instances, however, was the practice reported of moving the privies from place to place as the vaults became full.

Condition of yards and premises.—The condition of yards and houses in company towns differs so markedly in the same locality and among the same class of employees that it seems reasonable to conclude that the differences are due to the care and attention given the matter by the company; so that bad conditions, as has been frequently asserted, can not be attributed to the tendency of the workmen to keep their yards in an unsightly condition. Generally speaking, where the company observes system in keeping streets and alleys clean and in repairing houses and has a regular man or corps of men to do that work, yards, too, as a whole, are observed to be in better condition of upkeep. Another factor in the case is the provision by the employer of rubbish and garbage cans for the use of the tenants. It is the experience of the general superintendent of one of the largest coal and coke companies in western Pennsylvania that once the company provides an adequate house and sightly premises the employees, and particularly the wives of employees, take a new interest in the house and its maintenance. Continuance of the improvements is desired, even demanded. A standard of comfort and decency of surroundings has been created, and a desire for its continuance persists. The employer is in an advantageous position to secure and maintain that standard of comfort and decency in surroundings of his tenants because his regulations in that respect are backed by the authority to discharge from employment. On the other hand, there is at times a tendency on the part of the employer to connive at unsightly premises and to be careless in regard to enforcing rules whenever there is a shortage or difficulty in securing labor. This would seem to be a short-sighted policy, since in the long run the reputation of a

FIG. 7.—Miner's cottage in an Ohio town. Four rooms; rent \$10 per month. Cost in 1912, \$675. Electric lights, but no modern sanitary improvements. Better than the average.

FIG. 8.—Western mining town with rudimentary drainage system.

company town for cleanliness, sightliness, and availability of recreational features is bound to attract labor, if one may rely on the opinions of those closest to the situation.

On the side of the employee it may be observed there is frequently a reluctance to make any demands for proper maintenance and improvements in the house, particularly when labor is plentiful and competition for jobs is keen, because of the inevitable control which the employer has over the employee by reason of owning the house and holding over him the threat of eviction.

Rents of Company Houses.

ALMOST without exception all houses are rented and not sold by the mining companies. It is not deemed advisable to sell houses, inasmuch as the coal mining properties are more or less temporary in their nature, mines tending to run out after a period of years. The rents here given are those of 1916. There may have been increases since then.

Pennsylvania and West Virginia.—The rent of the miner's house in the Pennsylvania and West Virginia region is generally from \$1 to \$2.50 a month per room. This rent also includes water in the case of 27 companies out of the 32 included in the survey of this region. Two companies include light also and three coal also as a part of the house rental.

Alabama district.—The rentals of company dwellings in the Alabama district appear to be moderate. Out of 5,698 dwellings, 1,652, or 29 per cent, rent for \$6 and under \$7 a month, and 4,244, or 74.5 per cent, rent for less than \$7 a month.

Colorado and Wyoming.—Of the 1,234 houses for which complete information was received, 78.5 per cent rent at less than \$9 a month and 20.9 per cent at less than \$7. Three-fourths of the houses rent for between \$2 and \$2.50 per month per room. It would appear that no higher rents are charged for the new than for the older houses. In the large company investigated, it may be observed, rents are established by the industrial agreement between employer and employed.

Generally rent includes only house and water. In all of the 12 camps under one control it includes also the use of an electric light on the front porch, since this is the only means of lighting the streets. In three of these 12 camps the use of water is charged for, owing to its scarcity; of the four independent camps it is charged for in two cases, in one of them at the rate of \$2 a month per house.

Three of the four independent companies report the charge for electric lights; in one this is 35 cents a light per month, in another 50 cents, and in the third \$1.50 to \$3 a house, according to power supplied. The company controlling 12 camps charges 25 cents a

light per month, not including the one on the porch. In a camp in Wyoming the charge is \$1 a month for the first light and 75 cents each for the others.

Table 4 summarizes the available information respecting the rents of company-owned houses in the bituminous-coal region. Rents for company houses in other mining communities are shown for comparative purposes.

LABOR ORGANIZATIONS.

Membership of Trade-Unions in Great Britain in 1918.

STATISTICS have recently been compiled by the British Ministry of Labor and published in the Labor Gazette for January, 1920, showing membership of trade-unions in Great Britain in 1918. The number of unions and the membership in 1918 (subject to revision) as compared with 1917 are shown in the following table:

MEMBERSHIP OF TRADE-UNIONS IN GREAT BRITAIN IN 1917 AND 1918, SHOWING PER CENT OF INCREASE IN 1918.

Groups of trades.	Number of unions at end of 1918.	Membership ¹ at end of—		Per cent of increase in membership, 1918 over 1917.

Total ⁴	1,220	5,547,000	6,624,000	19

¹ The total membership (all trades) includes members in colonial and foreign branches to the number (in 1918) of 49,126, of whom 22,063 belonged to the Amalgamated Society of Carpenters, Cabinet Makers and Joiners and 26,465 to the Amalgamated Society of Engineers.

² The figures are exclusive of the membership of General Labor Unions, for which see "General Labor."

³ Exclusive, as usual, of a few associations (generally unimportant) from which complete returns have not been received.

It is explained that the classification is necessarily somewhat rough, since trade-union organization is in many cases occupational and a minority of the members may be employed in trades other than that

with which the union has been classed. As an example it is noted that many members of the carpenters' and joiners' unions are employed in the shipbuilding industry but that no statistics are available as to the total number, and the whole of the membership of those unions is accordingly included under the building trades, in which the members are mainly employed.

Commenting upon the increase of female membership, the report states:

Of the total increase in female membership (about 320,000, or 36 per cent) in the year the cotton industry accounted for 15,000, or about 6 per cent of its female membership in 1917, and other textile trades, including textile printing, bleaching, dyeing, finishing, etc., for 40,000, or 34 per cent—a total increase for the textile trades of 55,000, or 15 per cent on their female membership of 363,000 in 1917. The female membership of other groups increased in 1918 from 540,000 to 806,000, the increase being made up as follows: Clothing trades 46,000 (or 64 per cent), printing, paper, etc., trades 19,000 (or 102 per cent), shop assistants, clerks, etc., 27,000 (or 58 per cent), miscellaneous trades 49,000 (or 21 per cent), "general labor" unions 103,000 (or 92 per cent), and employees of public authorities 22,000 (or 40 per cent). In connection with these figures it should be observed that the female membership stated in the returns received by the department is partly estimated, many unions being unable to state exactly the number of males and females, respectively.

A table is given showing the increase in membership over a period of years from 1913 to 1918, by groups of trades. There was a very slight increase in 1914 over 1913—from 4,192,000 to 4,199,000—but beginning with 1915 the increase each year over the preceding year was quite marked. The membership in 1915 was 4,417,000; in 1916, 4,677,000; in 1917, 5,546,000; and in 1918, 6,624,000.

Ninth Scandinavian Labor Congress, Copenhagen, January 21-23, 1920.

A RECENT communication to the State Department from the United States Minister at Copenhagen describes briefly the proceedings of the Ninth Scandinavian Labor Congress, which was held in that city January 21 to 23, 1920. The letter is as follows:

The ninth Scandinavian labor congress, comprising about 400 delegates from Norway, Sweden, Denmark and Finland, was in session in Copenhagen from January 21 to 23, inclusive. The congress was the first to be held since 1913, and it was expected in many quarters that its course and decisions would demonstrate that Scandinavian labor had grown much more radical, it being even considered possible that a distinct Bolshevik tone would prevail. These expectations however were not realized. With the exception of the Norwegian delegation, which evidently contained a substantial number of extremists, the congress appeared to be composed of men who advocated the attainment of social reforms by constitutional methods. Among the more prominent members of the conference were the Danish Minister of Labor, Stauning; the Swedish leader, Hjalmar Branting; and the leader of the social democratic group in the Norwegian Storting, Buen. The principal Finnish delegate was Yrjö Räsänen.

On the first day of the congress a Norwegian delegate proposed that a message of greeting should be sent to the Russian Soviet Government, with exuberant expressions of support. His motion however was referred to a committee and not taken up again during the congress.

Resolutions Adopted by the Congress.

With the exception of six Norwegian votes, the congress unanimously passed the following resolution:

It is the task of Social Democracy to win economic and political power with the object of making the means of production the property of the whole people and of socializing production.

For the attainment of this object labor is organized in three ways, namely: By trade as producers, cooperatively as consumers, and politically as citizens. None of these forms of organization by itself is sufficient. They complement and support each other and must cooperate as intimately as possible, while at the same time there is conducted the work of enlightenment and self-education, which will prepare the laboring class for administrative insight and capacity.

The congress exhorts the laboring class to a strong vocational and political work to win social power, so that the transition from capitalism to socialism can take place without the application of violent means. The socialistic society, which is a higher and nobler organization than the present one, must be developed organically in consonance with economic and cultural progress, built up by a laboring class, which steadily raises its material intellectual and moral level, and disciplines and capacitates itself for its great vocation, namely: To supplant labor for wages in the service of capitalists by cooperation between free and equal participants in production and distribution.

For the preparation of this, increased participation of labor in the control of industry will be useful and necessary, just as it will counteract the danger of bureaucracy in the conduct of present State, municipal, and private affairs. The right of codetermination, which has already been attained with reference to the conditions of labor through the influence of the trade-unions, must be in an increasingly degree extended to the right of codetermination in industry itself, whereby the workmen obtain an insight into the respective industries, secure increased interest in their conduct and an increased sense of responsibility, while, likewise, an insight into the accounts will in a steadily increasing degree insure to them the fruits of their labor, which in turn increases the joy of labor and the sense of responsibility.

The organization of control committees (vocational councils), which will further such a development, must take place in such a way that the trade-unions are not thereby divided or weakened, but supported and strengthened. They should be assured influence in the composition of the control committees. In these there should be representatives who can train themselves more and more in administrative and financial matters. At the same time, the interests of society should be assured by a supervisory council (economic council), eventually in connection with a district council or a special council for the various industries, with the power of carrying out the necessary control of industrial life, of seeking the substitution of private capital in steadily increasing degree by social capital, and of advancing a plan for an increasingly economical and fruitful organization of production. In the supervisory council (economic council) there should be represented besides the producers also the interests of society and the consumers.

The social organization of economic life contemplates a well-planned application of labor, raw material, energy, and technical auxiliaries in the interests of the laboring and consuming public. Socialization must in the first place include well-equipped industry, together with sources of power and supplies of raw material, while at the same time cooperation must be fostered with all strength.

Industrial democracy should thus be a part of the process of socialization. The congress warns against the idea that the economic reform of society can take place in a day, as well as against the tendencies to erect group property and group activities, which are not subject to the control of society. The congress maintains that democracy must be the basis and socialism the goal for the liberating efforts of the laboring class.

The world war, with its enormous failure for the capitalistic and militaristic system, has brought about a feeling among the masses that it is not worth while to produce wealth anew without the assurance that this wealth will not again be wasted with fearful sufferings for the peoples. It is the task of social democracy to lead this feeling

into a fruitful and organized course for conscious work toward a new and higher social order, in which the position of the workmen will be changed in principle through socialism, and toward a new and higher world order in which the democratic and socialistic peoples are organized in a real league of peoples for mutual help instead of wild competition and bloody war.

The congress exhorts the workmen in the Scandinavian countries to ever more powerful cooperation on the foregoing basis.

Subsidiary resolutions were passed on the following subjects: Socialization; Scandinavian cooperation; mutual support of labor in various countries; social legislation, and relations to the Internationale. Of these resolutions the most important is the last, whereby the congress clearly expressed its adherence to the old Social Democratic Internationale, and definitely recorded its unwillingness to be associated with the so-called Third Internationale. A proposal to join the Third Internationale, which was made by three Norwegian representatives, obtained only 15 votes as against the rest of the congress.

With reference to the Russian situation, a resolution in the following terms was passed, notwithstanding the efforts of certain Norwegian delegates to obtain a much more affirmative declaration in support of the Russian soviet system:

The congress notes with satisfaction that the efforts to restore the reactionary régime in Russia now finally seem to have failed—in spite of the support of international capitalism—thanks to the resistance of the Russian workmen and peasant classes, as well as to the unanimous protest of the international labor class, against foreign armed intervention in Russian affairs. The congress hopes that a speedy peace will afford the Russian people the possibility of free internal development and good relations with all other peoples.

The congress passed other resolutions, proposed by Branting: Welcoming the Finnish amnesty law; expressing disapproval of the terroristic counter-revolutionary régime in Hungary; protesting against Jewish pogroms in the Ukraine and elsewhere in eastern Europe; and finally protesting against the recently attempted abolition in Sweden of the legally established eight-hour day.

It seems to be generally felt in Denmark, though this feeling is not shared by the most conservative elements, that the Ninth Scandinavian Labor Congress was on the whole a moderate expression of the present status of the labor movement in Scandinavia.

STRIKES.

Trade Disputes in Great Britain in 1919.

DURING the year 1919 in Great Britain there were 1,413 trade disputes reported, this number being only once exceeded since 1888, namely in 1913, when 1,497 were reported. The number of workpeople involved directly and indirectly was 2,581,000, the highest total yet reported, and nearly equal to the combined totals for the four previous years. These facts are brought out in a summary of disputes in 1919 published in the British Labor Gazette for January, 1920. It is further stated that the aggregate duration of these disputes was 34,483,000 working days, or nearly twice as many as during the period 1915 to 1918. The number of disputes, the number of workpeople affected, and the aggregate duration of the disputes in 1919 as compared with 1918 are shown in the following table.¹ The number of workpeople includes those involved in disputes which began in the previous year and were still in progress at the beginning of the year.

¹ These figures are preliminary and subject to correction.

In explanation of some of the disputes in 1919 the report says;

The principal disputes of the year occurred in the coal-mining, engineering, and shipbuilding, textile and transport industries. In the coal-mining industry 150,000 workpeople in Yorkshire ceased work for 13 days in January to enforce a simultaneous interval for surfacemen's meals, and again on July 16 for 29 days owing to dissatisfaction with the amount of advance in rates of wages which was proposed in com-

pensation for a reduction in working hours under the Sankey award. At the end of March 100,000 miners in various districts were idle for six days in support of a national application for an advance in wages. In the engineering and shipbuilding trades 150,000 workpeople stopped work in January and were idle for periods ranging in different districts, from one to eight weeks on the reduction of the working week from 53 or 54 hours to 47 hours, owing partly to dissatisfaction at the new arrangement of working hours and partly to the nonprovision of any increase in the rates of wages of pieceworkers and lieuworkers. On September 22 between 40,000 and 50,000 iron founders, core makers, and dressers ceased work for increases in wages and were still idle at the end of the year. In the cotton trade about 450,000 operatives struck work for 18 days in June and July in support of an application for reduced working hours and increased rates of wages. In the railway services about 500,000 operatives were idle from September 27 to October 5, inclusive, owing to dissatisfaction at the new standardized rates proposed for various grades. The majority of the other disputes occurring in 1919 arose either on demands for advances in wages or on questions of working hours.

Labor Unrest in the Belgian Coal Industry.

A REVIEW of the Belgian coal industry for 1919, published in the Board of Trade Journal (London) for February 19, 1920, reveals the existence of a considerable amount of industrial unrest. During the first half of the year 36 strikes involving 70 pits and 16,000 workers occurred. To deal with this unrest "Commissions de Conciliation" were established in various mining localities and "Commissions Régionales Mixtes" for larger districts.

These commissions consisting of representatives of operators and men, in an effort to settle existing disputes, established the principle of an 8½-hour day from June 1, 1919, and an 8-hour day from December 1, 1919, for pit workers, and a 9-hour day from June 1, 1919, for surface workers, and endeavored to settle other minor trouble-producing matters.

Notwithstanding their efforts, however, a serious strike occurred at Charleroi, December 15, 1919. The strike, which was declared contrary to the advice of the labor leaders, was due to two causes: (1) The enormous profits of the colliery owners from which the workers felt that they had not correspondingly benefited; (2) the unsatisfactory operation of the "Commissions Mixtes" due to "the procrastinating attitude of the miners' representatives, and of the absence of legal sanction for the decision of the commissions."

The men claimed (1) either a wage increase or State control of owners' profits; (2) a definition of the 8-hour day for pit workers and an 8½-hour day for surface workers, which should include time spent in descending and ascending, meals, etc.; (3) a pension of 2 francs (38.6 cents, par) per day; (4) an improved system of health insurance.

Through the intervention of the Ministry of Industry a settlement was reached December 20, 1919, in which the miners were guaranteed "(under protest from the owners)" a wage increase of 2.50 francs

(48.3 cents, par) per day, the other disputed questions being left to further discussion by the commissions and final settlement through proper legislation.

Establishment of an Emergency Strike-Breaking Corps in Germany.¹

DISCUSSING strikes in undertakings which are of vital importance to the general public, Dr. Waldemar Zimmermann, in an article in *Soziale Praxis*, writes that after the strike period of the first six months of 1919 a reaction against strikes set in, even among the workers themselves. This feeling was particularly in evidence in the case of the miners' strike, the steel strike, and the strike among employees in the water and electrical works, all of which directly affected the public. But the number of workers who attempted to prevent such strikes as these was small and their efforts were ineffective. Finally Herr Noske, the minister of national defense, recruited a voluntary workers' defense corps, to act, in such cases, for the protection of the nation at large.

Organization of the Corps.

AT the beginning of September last the "Emergency Engineer Corps" (*Technische Nothilfe*) made its appearance. It was formed from the engineer battalion of the former Berlin guard regiments, and in spite of its speedy demilitarization, i. e., its transference to a civilian instead of a military basis, it remained under the jurisdiction of the Ministry of Defense. The *Correspondenzblatt*² publishes the following regarding the organization and activities of this emergency corps:

The corps has its headquarters in Berlin and branch offices in various districts of Germany, which for this purpose was divided into 19 districts. In every district, a volunteer engineer corps was formed out of technical experts, skilled and unskilled workers, with three groups: The first consisting of volunteers ready for employment throughout Germany, the second of those who were willing to serve in their own district, and the third of those who were ready to serve in their own place of residence, should occasion arise. The emergency corps was to intervene only when industrial establishments of vital importance were about to be crippled by political strikes—establishments, that is, which supply the public with gas, electricity, water, foodstuffs, etc. Protective measures were adopted in advance; in every industrial establishment the nature and place of his activities were prescribed for each volunteer, so that immediately after a strike breaks out, operation of the establishment can be carried on by the emergency corps, in conjunction, on occasion, with those workers and employees who are willing to continue at work and are not desirous of taking part in a political strike. For the purpose of these preparations the emergency engineer corps has procured accurate working plans, descriptions of the machinery, boilers

¹ Source: *Soziale Praxis und Archiv für Volkswohlfahrt*, Vol. 29, No. 7, Berlin, 1919; *Correspondenzblatt der Generalkommission der Gewerkschaften*, Berlin, Oct. 25, 1919.

² *Correspondenzblatt der Generalkommission der Gewerkschaften*, Berlin, October 25, 1919.

and plant, and lists of the workers in the works concerned, and has secured itself an imposing array of volunteers by confidential personal canvassing. According to the central office, about 30,000 volunteers have been obtained for the entire Commonwealth, and 6,000 for Berlin alone.

Trade-Union Criticism.

DURING the brief period of its existence, it seems that the emergency engineer corps has been able to give a few proofs of its utility and efficiency. The extension of the Berlin metal workers' strike by a sympathetic strike of electricians was the first occasion on which the intervention of the corps aroused attention. As a general rule, according to the paper quoted above, the fact that such a corps exists acts as a deterrent to certain improper strike practices in public utility works. That would seem to be best proved by the demonstrations of indignation on the part of those workers and employees who find themselves especially affected and who claim that emergency corps are unnecessary, since the organizations that arrange the strikes invariably take meticulous care not to allow vital economic processes to be interrupted by the strike. In face of such protestations of innocence it would seem as if the emergency corps were the heartless invention of a reactionary strike-breaking Government. As a matter of fact, it is contended, if it had been so it would have been very difficult for the National Government, with its strong infusion of trade-unionists, to adopt this public measure of defense which has been received with complacence and in part with actual satisfaction by all classes of society save the Independent Socialists alone. In the National Assembly on October 17, Herr Noske, minister of national defense, replied to the criticism of the emergency corps by the Independent Socialists and declared that any man who again attempted to cripple works vital to the public would very soon find himself under lock and key; so much was due for the protection of the lives and health of hundreds of thousands of people.

Some notice may be taken of the protests of the committee of the Association of Municipal and State Workers and of the Berlin committee of the Joint Board of Free Employees' Associations. The former claims to notice widespread unrest among its workers in public utility works, and similar unrest in Munich has already led to the refusal of the services of the emergency corps by the authorities. Even if the Government does not wish to touch the right to strike, the emergency corps, it is stated, practically puts an end to the efficacy of a strike. The association protests in the name of 250,000 workers in public establishments against the corps, in the conviction that the workers are seriously desirous of protecting these establishments from all attacks from within or without. The latter body, by

its committee's resolution, acclaims the general right to strike as "one of the most noteworthy victories of the revolution," and consequently takes great exception to the fact that the right of combination hitherto conceded without conditions by the Government is being restricted by an embargo on strikes by the military authorities and by organizations which receive official support and which make the right of certain workers to strike ineffective. The resolution continues:

The reason alleged for the existence of the emergency corps, that for the maintenance of certain vitally necessary industrial establishments emergency work must be performed, is untenable. The trade-unions, even in their most bitter economic conflicts, have always observed the laws of humanity without there being any necessity for Government intervention. It is, however, desirable that in all cases where the authorities, for reasons connected with the public safety or health, deem it necessary to intervene, an agreement should be come to with the trade-unions concerned with respect to the introduction of emergency labor.

A Defense of the System.

THE emergency corps is regarded by some as an urgent necessity. At the meeting of members of the Majority Socialist party on October 20, 1919, a resolution of sympathy with the metal workers out on strike was passed, but regret was expressed that by the contemplated crippling of the electrical works the life and health of thousands would be seriously endangered. A promise to carry on necessary work would have had no value, since it is technically impossible to convey current to hospitals and such institutions alone. The meeting consequently considered that the continuance of operation of the power works with the aid of the emergency corps was a necessity, and, finally, uttered a vigorous protest against the attempt to exclude members of the corps from the trade-unions.

The second part of the protest—that the emergency corps is making the right to strike ineffective and is tampering with the unconditional right to combine—is said to be contradicted by the facts. The original cause of the protest was the intervention of the corps in the Berlin metal workers' strike, when, owing to a lack of firm leadership among the workers, the strike leaders desired to attack a vital organism of the city and to replace the lack of cohesion in their own ranks by sabotage. And if this weapon of force, bringing sickness, hunger, and cold to the innocent, is taken out of the hands of the trade-unions, should it be called an attack on the right to strike and combine? The Government and the emergency corps have repeatedly given the assurance that they will never intervene in the case of economic strikes, but only in that of political strikes which threaten the health and lives of the public, and that intervention will cease at once when the danger is past. This assurance meets with approval from the great majority of the nation.

CONCILIATION AND ARBITRATION.

Provisions for Dealing with Labor Disputes in Great Britain During the War.¹

THE Ministry of Labor has just published a report (No. 185 of 1919) of proceedings under the Conciliation Act, 1896, and of arbitration under the Munitions of War Acts, together with particulars of (1) proceedings under the Wages (Temporary Regulation) Act, 1918, and (2) settlements arrived at under the Coal Mines (Minimum Wage) Act, 1912.

The report, which has been prepared in the wages and arbitration department of the ministry, relates to the war years 1914-1918.

The requirements of the war necessitated new powers for dealing with labor disputes, and these have been traced in some detail in the report with special reference to the following points:

1. The Conciliation Act, 1896. This was the only act under which, prior to the war, steps could be taken by the appropriate Government department (at that time the Board of Trade) for the settlement of labor disputes. The act provided for voluntary conciliation and arbitration, and gave the department no compulsory powers.

2. The Committee on Production. This committee was established in February, 1915, to inquire and report as to the best steps to be taken "to insure that the productive power of employees in engineering and shipbuilding establishments working for Government purposes should be made fully available so as to meet the needs of the nation in the present emergency." With the establishment of the Ministry of Munitions the functions of the committee in regard to production were absorbed by the ministry. The committee then became an arbitration body and quickly developed into the principal arbitration tribunal for the settlement of labor disputes.

3. The "Treasury Agreement" on the subject of the acceleration of output on Government work, negotiated by the chancellor of the exchequer and the president of the Board of Trade in March, 1915, with the principal trade-unions. The Government's main proposals embodied in the agreement were on the one hand to limit profits and on the other to prevent stoppages of work owing to trade disputes, and to secure the suspension during the war of restrictions on output.

¹ From the Labor Gazette, London, February, 1920 pp. 58, 59).

4. The Munitions of War Act, 1915. This act, passed in July, 1915, introduced compulsory arbitration at the option of the Board of Trade, together with the legal prohibition of strikes and lockouts in certain circumstances, and the statutory enforcement of awards. The act also gave legal sanction to the Government's pledge to limit profits, and generally to the terms of the "Treasury Agreement."

5. The Munitions of War Act, 1916. As regards the matters dealt with in this report, the principal amendments increased the Government powers in respect to compulsory arbitration, extended the definition of "munitions work," and established new arbitration tribunals for women, and for semiskilled and unskilled men.

6. The New Ministries and Secretaries Act, 1916, under which the powers and duties of the Board of Trade in regard to the settlement of labor disputes were transferred to the Ministry of Labor.

7. The Commission of Inquiry into Labor Unrest, appointed in June, 1917, following a dispute in May involving about 200,000 work-people in the engineering trades in various parts of the country.

8. The Munitions of War Act, 1917. This act inter alia made provisions for the legal extension of awards to the whole of a trade or industry. It also authorized the minister of munitions to give directions as to the remuneration for work paid at time rates; it was under this authority that the orders giving the 12½ per cent bonus on earnings to time workers in the engineering and foundry trades and in shipbuilding and ship-repairing establishments were issued.

9. The Wages (Temporary Regulation) Act, 1918, passed shortly after the armistice. This act modified the sections of the Munitions of War Acts relative to the legal prohibition of strikes and lockouts and compulsory arbitration, and also stabilized wages during the period of transition from war to peace conditions.

Included in the report is a note on some of the results which were observed for the working of the measures adopted during the war for the prevention of strikes and lockouts, with particular reference to (a) the question of the legal prohibition of strikes and lockouts and the accompanying provisions for compulsory arbitration and for the enforcement of awards, and (b) the steps taken to secure coordination of the labor activities of Government departments. A note has been included on the various commissions of inquiry which were set up during the war to examine the question of labor unrest. An account is also included in the report of the general wage movements during the period of the war, reference being made to the various agreements negotiated during the war for a four-monthly hearing of general wage applications by the committee on production, the course of wage increases in the engineering trade being specially dealt with.

The report also contains particulars of the cases referred to arbitration during this period, and shows the large extent to which this method of settling disputes was adopted throughout the war period. The number of cases referred to arbitration during the period under review was approximately 8,000, of which about one-half were dealt with by the committee on production.

In practically every trade, wages and working conditions were at one time or another dealt with by conciliation or arbitration proceedings under the auspices of the department, and in many important trades these were determined periodically by a series of awards. The cases referred to arbitration, while relating mainly to wages questions, concerned all branches of working conditions. A summary of the various awards and conciliation settlements appears in appendixes to the report.

The report also contains a diagram showing month by month from January, 1914, to December, 1918, the number of strikes and lockouts commencing during the month, and the number of work-people involved in strikes and lockouts.

PUBLICATIONS RELATING TO LABOR.

Official—United States.

DISTRICT OF COLUMBIA.—*Minimum Wage Board. Second annual report for the year ending December 31, 1919. Washington, 1920. 60 pp.*

A summary of this report is given on pages 112 to 115 of this issue of the MONTHLY LABOR REVIEW.

HAWAII.—*Governor. Report to the Secretary of the Interior for the fiscal year ended June 30, 1919. Washington, 1919. 89 pp. Map.*

Contains sections on prohibition; population, immigration, and labor; industrial accident boards; and public health.

ILLINOIS.—*Pension Laws Commission. Report, 1918-1919. A proposed standard plan for a comprehensive and permanent system of pension funds. [Springfield, 1919.] x, 379 pp.*

A brief digest of this report is given on pages 189 and 190 of this issue of the MONTHLY LABOR REVIEW.

PENNSYLVANIA.—*Department of Public Instruction. The school law and an appendix, 1919. Harrisburg, 1920. 320 pp.*

Among the subjects included are Vocational and other special schools; Child labor and continuation schools; Employment of children; and Teachers' retirement system.

UTAH.—*Industrial Commission. Supplemental report, including analysis of industrial accidents covering causes, extent and duration of disability, degrees of disability, occurrence of accidents by month of year, together with a special study of specific injury and fatal cases for period July 1, 1917, to June 30, 1918. Salt Lake [1918]. 95 pp. Tables.*

WISCONSIN.—*State Board of Vocational Education. Courses of study. Cabinetmaking: Shop, drawing, safety, mathematics, trade technology, equipment, references. Madison, 1919. 15 pp. Monograph No. 8.*

——— *Printing: Shop, mathematics, English, technology of trade, safety and hygiene, equipment, references. Madison, 1919. 13 pp. Monograph No. 6.*

——— *Telegraphy: Shop, science, trade technology, equipment, references. Madison, 1920. 14 pp. Monograph No. 7.*

UNITED STATES.—*Congress. Joint commission on reclassification of salaries. Report submitting a classification of positions on the basis of duties and qualifications, and schedules of compensation for the respective classes. March 12, 1920. Washington, 1920. 884 pp. 66th Congress, 2d session. House document No. 686.*

Some account of this report appears on pages 105 to 108 of this issue of the MONTHLY LABOR REVIEW.

——— *Department of Commerce. Bureau of Foreign and Domestic Commerce. British industrial reconstruction and commercial policies. Washington, 1920. 88 pp. Special agents series, No. 193.*

——— *Department of Labor. Bureau of Immigration. Annual report of the commissioner general of immigration, fiscal year ended June 30, 1919. Washington, 1919. 412 pp.*

——— *Women's Bureau. Women in the Government service. Washington, 1920. 37 pp. Bulletin No. 8.*

A summary of this report was published in the MONTHLY LABOR REVIEW for January, 1920, pp. 208-217.

UNITED STATES.—*Department of the Interior. Bureau of Education. Some phases of educational progress in Latin America, by Walter A. Montgomery. Washington, 1920. 62 pp. Bulletin, 1919, No. 59.*

A special feature of this report is the account of industrial and vocational training given under the various educational systems of these countries.

— *Federal Board for Vocational Education. Coal-mine gases. Washington, October, 1919. 36 pp. Bulletin No. 39, Trade and industrial series No. 9.*

This bulletin is supplementary to General mining bulletin No. 38 (Trade and industrial series No. 8), and is intended to form the basis of instruction in a study of coal-mine gases in trade extension classes, the material having been prepared originally for use in the mining extension class of West Virginia. It contains information of which every man in the mine, including superintendent, foreman, and fire boss should possess at least an elementary knowledge.

— *Industrial Conference. Report of conference convened by the President December 1, 1919. Washington, March 6, 1920. 51 pp.*

This report is treated in an article published in this issue of the MONTHLY LABOR REVIEW, pages 33 to 40.

— *Railroad Administration. Comparative amounts of railroad labor and pay December, 1917, and January to July, 1919. Letter from the Director General of Railroads in response to a resolution of the Senate of August 20, 1919, submitting statements relating to the amount of railroad labor and its rates of pay in December, 1917, and in each month from January to July, 1919. Washington, 1919. 184 pp. 66th Congress, 1st session. Senate Document No. 154.*

This statement is noted briefly in the December, 1919, issue of the MONTHLY LABOR REVIEW, pages 229 to 236.

— *Tariff Commission. Costs of production in the dye industry, 1918 and 1919. Details of costs for a selected list of dyes and intermediates. Washington, 1920. 24 pp. Tariff information series No. 15.*

Official—Foreign Countries.

AUSTRALIA.—*Bureau of Census and Statistics. Labor and Industrial Branch. Prices, purchasing power of money, wages, trade-unions, unemployment, and general industrial conditions, 1918. Melbourne, July, 1919. 268 pp. Report No. 9.*

Contains information in summarized form regarding labor organizations, employment and unemployment, wholesale and retail prices, rents, purchasing power of money, cost of living, wages, hours of labor, industrial disputes, operations under Arbitration and Wages Board Acts, and industrial accidents. The appendixes contain detailed information on wholesale and retail prices and rents and on minimum rates of wages and hours of labor in the important occupations in the several States on December 31, 1918.

— — — *Official yearbook, containing authoritative statistics for the period 1901-1917, and corrected statistics for the period 1788 to 1900. Melbourne [1919]. No. 11.—1918. xl, 1246 pp. Maps.*

— (SOUTH AUSTRALIA).—*Inspector of factories. Report, 1918. Adelaide [1919]. 12 pp.*

Reports 1,814 factories registered, employing 18,566 persons, of whom 1,280 were children between the ages of 13 and 16 years. About 30 per cent of the total employees were females. Included is a list of trades in which the number of hours worked per week is from 44 to 56. The report gives a comparison by industry and by sex and age of workers of wage rates prevailing in 1917 and 1918. These show a marked increase in 1918.

CZECHO-SLOVAKIA.—*Ministère de la Prévoyance Sociale. La Conférence du Travail et l'État Tchéco-Slovaque. Prague, 1919. 78 pp.*

As indicated by the title this brochure is essentially a digest of the labor laws in force in Czecho-Slovakia on September 30, 1919. "The Republic has not yet been able to establish its social policy, but it has undertaken to modify in consonance with new conditions some portions of the Austrian and Hungarian codes which in so far as they have not been amended constitute the law of the land during the period of transition."

A chapter is devoted to the history of the social policy of the State from its origin up to the date of the revolution, October 28, 1918. Such social laws as have been enacted by the National Assembly are noted in the MONTHLY LABOR REVIEW for February, 1920, pp. 239 to 245.

FRANCE.—*Ministère du Travail et de la Prévoyance Sociale. (Direction des Retraites Ouvrières et Paysannes.) Recueil de documents sur les retraites ouvrières et paysannes; Instructions et circulaires. Première série, seconde série. Paris, June 1, 1914, June 1, 1919. 390, 283 pp.*

Text of instructions and circulars in force on June 1, 1914, and June 1, 1919, concerning retired workmen and peasants.

——— *Lois, décrets et arrêtés. Paris, January 1, 1919. 220 pp.*

Text of laws, decrees, and acts in force January 1, 1919, regarding retirement of workmen and peasants.

GERMANY.—*Statistisches Amt. Streiks und Aussperrungen, 1915, 1916. Berlin, 1916-17. 25*, 25 pp. Statistik des Deutschen Reichs, Band 280, 282.*

Volumes 280 and 282 of the Statistics of the German Empire published by the Imperial Statistical Office and containing the official strike statistics for the years 1915 and 1916. The extent of strikes and lockouts in these two years is shown in the following table:

STRIKES AND LOCKOUTS IN GERMANY IN 1915 AND 1916.

Year.	Strikes.				Lockouts.			
	Number.	Estab- lishments affected.	Strikers.	Days lost.	Number.	Estab- lishments affected.	Persons locked out.	Days lost.
1915.....	137	178	11,639	41,838	4	7	1,227	3,673
1916.....	240	437	124,188	245,404				

The number of strikes, strikers, lockouts, and locked-out workers in 1915 was insignificant compared with that of prewar years. In 1916 the number of strikes and strikers increased considerably but no lockouts were reported during the year. Of the 141 labor disputes reported in 1915, 24 terminated favorably for the strikers, 39 were partly successful, and 78 failed from the workers' point of view. The corresponding figures for the 240 strikes of 1916 were 27, 130, and 83.

GREAT BRITAIN.—*Board of Education. Salaries of teachers in public elementary schools. England and Wales. Statement showing the number of teachers—classified according to sex, qualifications, and (except for schools not maintained by local education authorities—Education Act, 1902, sec. 15) type of area in which employed—in public elementary schools in England and Wales, who on the 1st day of April in each of the years 1917, 1918, and 1919 were in receipt of annual salaries of the amounts specified. London, 1919. 15 pp. Cmd. 513. Price, 2d. net.*

——— *Board of Trade. Statistical Department. Statistical abstract for the United Kingdom in each of the last 15 years from 1903 to 1917. Sixty-fifth number. London, 1919. 429 pp. Cmd. 491. Price, 1s. 9d. net.*

GREAT BRITAIN.—[Foreign Office.] *Report on Japanese labor, by Oswald White.* London, 1920. 42 pp. Cmd. 511. Price, 3d. net.

Touches briefly upon the physical and mental qualities of Japanese labor, explaining why such labor is inefficient. States that it is the oversupply of labor that causes poor wages and low efficiency, and refers to woman and child labor as a feature of Japanese industry. There is considerable home work done, which is "wretchedly paid." Draws a rather dark picture of Japanese labor conditions, but concludes that employers have come to realize that the care of their workmen pays and that the treatment accorded to them in some instances "appears to reach a comparatively high level." Tables are given showing the extent to which labor was employed in factories at the end of 1916; results of an inquiry into the cost of living in 1912; an actual family budget; average wages paid in Yokohama in July, 1914, and June, 1919, and in Tokyo in November, 1918; and strikes in Japan in specified months in 1919.

— *Home Office. First aid and ambulance at factories and workshops.* London, 1919. 21 pp. 9 plates. Price, 6d. net.

Issued for "the guidance of occupiers of factories and workshops in establishing at their works a satisfactory first-aid and ambulance service."

— *Chief inspector of mines. Mines and quarries: General report, with statistics, for 1918. Part III.—Output.* London, 1919. Pp. 145-168. Cmd. 531. Price, 3d. net.

The total value of the minerals produced during the year amounted to £257,079,792 (the par value of £1=\$4.8665), which was an increase of £33,145,803 as compared with 1917. The total output of coal was 227,748,654 tons, and the value £238,240,760, showing a decrease in the output of 20,750,586 tons and an increase in the value of £30,453,866 on the figures for 1917. The average price of coal was 20s. 11.06d. per ton in 1918, as compared with 16s. 8.68d. in 1917.

— *Ministry of Labor. Conciliation Act, 1896. Twelfth report of proceedings under the Conciliation Act, 1896, and report on arbitration under the munitions of war acts. Together with particulars of (1) Proceedings under the Wages (Temporary Regulation) Act, 1918, and (2) Settlements arrived at under the Coal Mines (Minimum Wage) Act, 1912. General report, 1914-1918. Vol. I.* London, 1919. 63 pages. Chart. 185. Price, 4 d. net.

— *Directory of joint standing industrial councils, interim industrial reconstruction committees, and trade boards, with index of members.* [London] January, 1920. 91 pp.

Lists 51 joint industrial councils in industries employing about 3,250,000 workpeople; 24 interim industrial reconstruction committees covering about 491,300 workpeople; and 23 trade boards representing some 790,200 workpeople.

— *Treasury. Staffs employed in Government departments. Statement showing the staffs of Government departments on 1st December, 1919, compiled from returns furnished to the Treasury.* London, 1920. 3 pp. Cmd. 533. Price, 1 d. net.

ITALY.—*Direzione Generale del Lavoro e della Previdenza Sociale. Divisione Previdenza Sociale. Assicurazione obbligatoria contro gli infortuni sul lavoro in agricoltura. Atti della commissione incaricata di predisporre lo schema di regolamento.* Rome, 1919. 220 pp. *Previdenza Sociale.* N. 2.

The minutes of the commission appointed by the Italian Ministry of Industry, Commerce and Labor, to prepare regulations for the carrying out of the law of August 23, 1917, relating to compulsory insurance against accidents in agriculture.

LEAGUE OF NATIONS.—*Economic and finance section. Conference on international cooperation in statistics, August 14 and 15, 1919.* London, Harrison & Sons [1919]. 41 pp.

Presents a summary of discussions in the conference on international cooperation and statistics held in London in August, 1919; also a brief statement relating to the work of the permanent office of the International Institute of Statistics, which is a private institution in which 27 countries have representation. Rules governing the

organization are given. There is also a brief résumé of the subjects on which statistics are now being gathered, including strikes and lockouts, employment, wages and hours of labor, cost of living, collective labor contracts, trade-unions and associations, cooperation, immigration, emigration, agriculture, railroads, insurance, housing, etc. The work of the Bureau of Statistics of the International Institute of Agriculture is briefly described.

SPAIN.—*Instituto Nacional de Previsión. Qué es el Instituto Nacional de Previsión. Su origen. Operaciones que realiza. Disposiciones por que se rige. Tarifas. Madrid, 1919. 40 pp.*

This pamphlet presents the purpose, history, and operations of the various pension systems under Government supervision in Spain.

SWITZERLAND (ZÜRICH).—*Statistisches Amt. Statistisches Jahrbuch der Stadt Zürich. Jahrgang 1917 zum Teil auch 1918. Zürich, 1919. xxviii, 31*, 338 pp.*

The thirteenth volume of the statistical yearbook of the city of Zürich giving data for 1917 and partly for 1918.

Unofficial.

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE. *The annals. Vol. 87, No. 176. The new American thrift. Philadelphia, January, 1920. 1-248 pp.*

Among the subjects treated in this issue the following are of special interest from the worker's standpoint: Thrift as a family and individual problem—some standard budgets, by B. R. Andrews; Thrift and labor, by A. H. Hansen; Organized labor's attitude towards the national thrift movement, by Frank E. Wolfe; Food thrift, by Raymond Pearl; The function of salvage in the education of industrial workers, by George W. Sherman; The development of thrift facilities, by Milton W. Harrison; and Cooperative credit institutions in the United States, by James B. Morman.

AMERICAN FEDERATION OF LABOR. *Illinois Branch. Proceedings of thirty-seventh annual convention. Peoria, Victor A. Olander, secretary-treasurer, 1919. 356, pp.*

— *Michigan Branch. Proceedings of the thirtieth annual convention. Lansing, Perry J. Ward, secretary-treasurer, 1919. 81 pp.*

AMERICAN GAS ASSOCIATION. *Committee on accident prevention. Accident prevention. [Philadelphia, 1919.] 27 pp.*

The latest report of this committee is largely devoted to a safety code under the heading "Precautionary measures." There is included an analysis of 1,000 cases of accident reported by 77 companies in 29 States. Among 14,656 persons employed at the time of reporting, there were 1,000 nonfatal accidents during the first nine months of 1919. Several charts are presented showing the number of cases due to various causes, the distribution by days of the week and by hours of the day, etc.

AMERICAN LABOR YEAR BOOK, 1919-20. *Edited by Alexander Trachtenberg. New York City, Rand School of Social Science, 1920. 447 pp.*

Summarizes briefly the most recent developments in the labor movement, both in the United States and in foreign countries. The material is arranged in six principal parts, and an appendix: I. Labor in the war; II. The labor movement in the United States; III. Labor and the law; IV. Social and economic conditions; V. The international socialist, labor, and cooperative movement; VI. The socialist movement in the United States; Appendix.

ARONOVICI, CAROL. *Americanization. St. Paul, Keller Pub. Co., 1919. 48 pp.*

Characterizing the Americanization movements as still in a formative state with "achievement hardly measurable in concrete terms," the author considers basic factors upon which he believes national unity might be built.

BULLOCK, EDNA D., COMPILER. *Selected articles on the employment of women. Second and enlarged edition by Julia E. Johnson. New York, The H. W. Wilson Co., 1920. 214 pp. Debaters' handbook series. Bibliography.*

CAVAILLÉ, J. *La Journée de huit heures. La loi du 23 avril 1919. L'historique-l'esprit-le mécanisme d'application.* Paris, 1919. 146 pp.

The first part of this study is devoted to a historical review of the eight-hour movement from its origin in England in 1833, when the first demand was followed by a strike of the tailors in London, up to April 23, 1919, when the eight-hour law was passed by the French parliament.

The second part is an analysis of the law; its application to varied industries; definition of hours of work; its effect on wages; and the methods of enforcement.

The text of the law of administrative regulations under it and of collective agreements of national scope entered into are given as appendixes.

CLARK, ALICE. *Working life of women in the seventeenth century.* London, George Routledge and Sons (Ltd.), 1919. 335 pp.

COURAU, R. *Les Assurances Sociales dans les Industries d'Alsace et de Lorraine. Code impérial d'assurances. Assurance des employés. Caisses minières de secours.* Strasbourg [1919]. 116 pp.

DUBLIN, LOUIS I. *The mortality of bituminous coal miners from influenza-pneumonia, October to December, 1918. In Journal of Industrial Hygiene, Boston, February, 1920. P. 483.*

Mortality figures for a total of 4,700 miners insured in the group department of the Metropolitan Life Insurance Co. during the period of the influenza-pneumonia epidemic in 1918 show that bituminous coal miners suffered severely from the epidemic as compared with workers in other occupations. The following table gives the death rates by age periods among such miners in comparison with those for all occupied white males:

INFLUENZA-PNEUMONIA MORTALITY AMONG BITUMINOUS COAL MINERS, OCTOBER TO DECEMBER, 1918, COMPARED WITH ALL OCCUPIED WHITE MALES.

Age group.	Annual death rate per 1,000.	
	Bituminous coal miners.	All industrial white males.
All ages (15 years and over).....	50.1	22.3
15 to 25 years.....	29.5	17.5
25 to 45 years.....	62.1	32.6
45 to 65 years.....	44.4	11.7

EDIE, LIONEL D., EDITOR. *Current social and industrial forces.* New York, Boni and Liveright, 1920. 393 pp.

A collection of extracts from the writings of authorities on various phases of the subject, grouped under the general headings of Forces of disturbance, Potentialities of production, The price system, The direction of industry, The funds of reorganization, The power and policy of organized labor, Proposed plans of action, Industrial doctrines in defense of the status quo, and The possibilities of social science. The chief distinguishing feature of the book is stated to be an "effort to bring a wide variety of liberal minds to bear on the social and industrial problem." There is an introduction by James Harvey Robinson.

ENGINEERING COUNCIL. *Report of committee on classification and compensation of engineers.* New York, 29 W. Thirty-ninth Street, December 15, 1919. 17 pp.

Contains a scheme for the classification of all classes of engineers with a tabular statement of salaries received in the Federal, State, and municipal services, and a schedule of proposed salaries submitted for discussion by the council.

GARTON FOUNDATION. *Memorandum on the industrial situation after the war. Revised and enlarged edition. London, January, 1919. 175 pp. Price, 2s. net.*

The present edition represents a considerable amount of revision and addition based upon the development of new issues and the enhanced importance of others since the publication of the first edition in October, 1916. This earlier edition was noted in the September, 1918, issue of the MONTHLY LABOR REVIEW, page 353.

GILBRETH, FRANK B., and GILBRETH, ILLIAN M. *Unnecessary fatigue—a multibillion enemy to America. In the Journal of Industrial Hygiene, Vol. I, No. 11. Boston, March, 1920. Pp. 542-545.*

This paper urges upon workers, organizations, and employers the value of the elimination of unnecessary fatigue.

HAMMOND, J. L., and HAMMOND, BARBARA. *The skilled laborer, 1760-1832. London, Longmans, Green and Co., 1919. 397 pp.*

LAKE CARRIERS' ASSOCIATION. *Annual report, 1918. Detroit, P. N. Bland Printing Co., 1919. 211 pp.*

LEACOCK, STEPHEN. *The unsolved riddle of social justice. New York, John Lane Co., 1920. 152 pp.*

This book presents a résumé of the problems which have developed since the beginning of the "industrial revolution" and especially of the troubled outlook which now confronts the world. The author analyzes socialistic aims and concludes that neither socialism nor the old individualism will work, but that while retaining our present system an awakened public conscience must see to it that unemployment and neglect of the old and the infirm and of children shall not be allowed; and that more opportunities for leisure, through shortened working hours and "a progressive movement of social control alleviating the misery which it can not obliterate and based upon the broad general principle of equality of opportunity," must be established.

MACDONALD, J. RAMSAY. *Parliament and revolution. Manchester, England, The National Labor Press (Ltd.), 1919. 116 pp. The Socialist Library XII.*

MARRIOTT, J. A. R. *The right to work. An essay introductory to the economic history of the French revolution of 1848. Oxford, England, Clarendon Press, 1919. 97 pp.*

"MINES FOR THE NATION" CAMPAIGN COMMITTEE. *Campaign leaflets Nos. 1 to 12. Cooperative Printing Society (Ltd.), London [1919].*

These leaflets form part of the propaganda of the British miners for nationalization of the coal mines and present statistics of accidents, wages, profits, output, strikes and lockouts, and prices as arguments for the adoption of their program.

MOCK, HARRY E. *Industrial medicine and surgery. Philadelphia, W. B. Saunders Co., 1919. 846 pp. 210 illustrations.*

This book deals with the new specialty "the human maintenance problem in industry," and is divided into six parts: Industrial health service; Prevention; Industrial medicine; Industrial surgery; Compensation; Insurance; Medico-legal phrases; and Reconstruction. It is based upon the author's experience as chief physician in a plant employing 15,000 persons.

It contains a detailed discussion of the establishment requirements, arrangements, equipment, maintenance, and other points connected with the operation of the large industrial health department. Especially valuable are the models of systems for keeping records, the precise descriptions of arrangement and equipment of medical-aid rooms, and the suggestions as to methods of conducting examinations and interviews and as to the number of physicians and nurses needed to give adequate care to large numbers of employees.

The book emphasizes that, on the one hand, incompetent and insufficiently trained doctors are bringing discredit upon industrial medicine and, on the other hand, because of the lack of opportunity for advancement, medical students of the better type do not seem inclined to select "mass" medicine as their life work. Dr. Mock favors the employment of part-time industrial physicians, believing that in this way the industry can get a better type of physician for the same outlay, and that this type of physician can afford to work on a part-time basis and utilize the remainder of his time in private practice and scientific investigation in his own specialty.

MUSCIO, BERNARD. *Lectures on industrial psychology. Second edition (revised). New York, E. P. Dutton & Co., 1920. 300 pp.*

Subjects discussed in these lectures are: The immediate aim of industrial psychology; Mental factors relevant to industry; Selection of workers on the basis of natural fitness; The best method of work; and The desirability of applying psychology to industry.

NAST, ALFRED. *Principes coopératifs et exposé synthétique de la législation. Paris, 1919. 330 pp. La Régime Juridique des Coopératives. Bibliography.*

This book is a study of the various forms of cooperation in France, covering producers and consumers cooperation, credit banks, cooperative agricultural societies, cooperative societies for the erection of cheap dwellings, and cooperative restaurants among munition workers. The first part of the book is devoted to a general discussion of the principles of cooperation and a classification of the different forms; the second part to an analysis of the laws relating to cooperation both in France and other countries.

NATIONAL CONFERENCE OF SOCIAL WORK. *Proceedings at the forty-sixth annual session held in Atlantic City, N. J., June 1-8, 1919. Chicago, 1920. 813 pp.*

An account of some of the features of this session of the conference is contained in the July, 1919, issue of the MONTHLY LABOR REVIEW, pages 119 to 123, and 238 to 242. Some of the papers read at the conference are also found in the same number of the REVIEW, pp. 1 to 13, 243 to 255.

The secretary of the conference thus summarizes the character of it: "In this year's proceedings, the incidence of new principles in social work and of contemporary influences upon welfare programs is more traceable than heretofore. An example is the paramount question of the bearing of the standard of living on social remedies, as developed especially in the symposium of the Division on Health. The dominance of the labor interest is shown through discussion appropriately not only in the Division on Industrial and Economic Problems, but in nearly every other division."

NATIONAL CONFERENCE ON AMERICANIZATION IN INDUSTRIES. *An outgrowth of the National Conference of Americanization Workers, held in Washington in May under the auspices of the Department of the Interior. Proceedings, Nantasket Beach, Boston, Mass., June 22, 23, and 24, 1919. A round-table conference of the actual workers engaged in Americanization activities within industrial concerns. Boston, 1034 Kimball Bldg., 1919. 144 pp.*

NATIONAL SAFETY COUNCIL. *Safe practices. No. 32. Exhaust systems. Chicago, 168 N. Michigan Avenue, 1920. 16 pp. Illustrated. Price, 25 cents.*

NATIONAL TRANSPORTATION CONFERENCE. *Program of railroad legislation. Washington, October, 1919. 185 pp. Charts.*

Contains a statement by W. N. Doak before the Committee on Interstate and Foreign Commerce of the United States House of Representatives, July 25, 1919, on the subject of boards for adjustment of wages and working conditions.

NATIONAL TUBERCULOSIS ASSOCIATION. *Second preliminary report of committee on mortality from tuberculosis in dusty trades. New York, 381 Fourth Avenue, September, 1919. 24 pp.*

The first preliminary report of this committee, which was submitted to the executive committee of the National Tuberculosis Association at its meeting in Pittsburgh, December 5, 1918, and published by the Working Conditions Service of the United States Department of Labor, was noted in the July, 1919, issue of the MONTHLY LABOR REVIEW, page 288.

PEOPLE'S YEARBOOK AND ANNUAL OF THE ENGLISH AND SCOTTISH WHOLESALE SOCIETIES, 1920. *Third year of publication. Manchester, England, Cooperative Wholesale Society (Ltd.), 1 Balloon Street, 1920. 401 pp. Illustrated.*

Contains statistics of the Cooperative Union and of societies in the various European countries, as well as articles on the Cooperative Party, housing, and town planning, and one by Sidney Webb, on the Poor Law. For a review of the operations of the societies belonging to the Cooperative Union see pages 131 and 132 of this issue of the MONTHLY LABOR REVIEW.

PHILLIPS, H. D. *Cooperative marketing in the Chautauqua-Erie grape industry. Ithaca, N. Y., September, 1919. 94 pp. Illustrated. Cornell University, Agricultural Experiment Station, Memoir 28.*

SAGET, JEAN-BAPTISTE. *Le problème de l'habitation à bon marché en France et à l'étranger. Thèse pour le doctorat, Université de Paris. Paris, 1919. 267 pp. Bibliography.*

The first part of this book is devoted to a study of the formation and development of the industrial society of Mulhouse which first undertook to solve the problem of providing cheap dwellings for workers in France; the second part takes up French housing legislation; the third, the problem as it is dealt with in other countries, and the fourth offers a solution of the question through municipal action.

SCOTT, J. W. *Syndicalism and philosophical realism. A study in the correlation of contemporary social tendencies. London, A. and C. Black (Ltd.), 1919. 215 pp.*

ŠEČEROV, SLAVKO. *Economic phenomena before and after war. A statistical theory of modern wars. New York, E. P. Dutton & Co., 1919. 232 pp. Bibliography.*

An exposition of the theory that modern wars are caused by unstable economic equilibrium which is caused by variation in the proportional growth of population, production, and consumption. These variations and their effect on the peace of nations or the world are shown by economic statistical data showing changes in conditions in pre-war, war, and post-war periods.

SELLEY, ERNEST. *Village trade-unions in two centuries. London, George Allen & Unwin (Ltd.), 1919. 183 pp.*

An account of the beginning of trade-unionism among agricultural laborers in England in 1833 and of the chief events in the history of such unions down to the present time. Tables giving average rates of pay in specified years and groups of years, from 1837 to 1910 and 1907 to 1917, and minimum rates in 1918 and 1919, as well as cost-of-living tables, are appended.

SHADWELL, ARTHUR. *Coal mines and nationalization. London, Longmans, Green & Co., 1919. 32 pp. (Reprinted from The Times.)*

THOMAS, JOHN. *The economics of coal. From the coal seam to the consumer's cellar. With special reference to the reports of the Coal Industry Commission (British). With foreword by Frank Hodges. London, Independent Labor Party, 1919. 24 pp. I. L. P. pamphlets, new series, No. 16. Price, 3 d.*

UNITED MINE WORKERS OF AMERICA. *Constitution of international union, adopted at Cleveland, Ohio. Effective January 1, 1920. Cleveland, 1920. 70 pp.*

VERBAND DER GASTWIRTSGEHILFEN. *Protokoll über die Verhandlungen des 9. Verbands-Tages. Berlin, 1919. 128 pp.*

The minutes of the ninth general meeting of the German Federation of Hotel, Restaurant, and Café Employees, held at Hanover September 23 to 27, 1919. The resolutions adopted by the meeting demanded the continued combating of the tip system, the strict observance of the eight-hour day, and a two years' apprenticeship for waiters and one of three years for cooks. The meeting also adopted new by-laws and regulations for the grant of strike, unemployment, sick, and funeral benefits.

—. *Statut und Unterstützungs-Reglement. Beschlossen auf dem 9. Verbandstag in Hanover. Berlin, 1919. 31 pp.*

The by-laws and benefit regulations adopted by the ninth general meeting of the German Federation of Hotel, Restaurant, and Café Employees.

VILLATE-LACHERET, MADAME. *Les inspectrices du travail en France. Paris, 1919. 142 pp. Bibliography.*

This treatise on the subject of women inspectors of labor in France, which was the author's thesis for her doctorate in the college of law of the University of Paris, covers the laws creating the positions of women inspectors, conditions governing their employment, their power, their relations both to employers and workers, the results which have been obtained, and proposed reforms.

WADE, SIR CHARLES G. *Australia. Problems and prospects. Oxford, England, The Clarendon Press, 1919. 111 pp.*

Chapters of special interest are on industrial and social problems and land settlement. In the first of these the author traces the history of industrial arbitration in Australia and from this history deduces a few leading propositions for the framing of industrial tribunals. These propositions include the following:

(1) Such tribunals should be composed of experts and practical men, representing both employer and employee, with a chairman who is firm but conciliatory. * * *

(2) Such tribunals should be permanent, that is to say, always available in case of emergency. * * *

(3) To secure the above objects of expert knowledge and prompt action, it follows that a board should be appointed for every substantial trade.

(4) It is essential that these tribunals shall be free from political influence of any kind. * * *

(5) I have come to the conclusion, after a long personal experience, that the introduction of penalties, either in the form of imprisonment or of fine, is an illusory protection.

Laws and Agreements Governing Working Conditions Among American Seamen.^a

A SPECIAL meeting of the General Conference of the International Labor Organization of the League of Nations is to be held at Genoa in June to deal with questions relating to seamen, for which the governing body of the International Labor Office has prepared the agenda.¹ This conference will meet under the conditions specified in the articles of the treaty governing the conferences of the International Labor Organization, and each member of the organization will be entitled to appoint four delegates, two of whom shall represent the Government, the remaining two being chosen from the most representative employers' and workers' organizations. Each delegate may be accompanied by two advisers for each item on the agenda. Since this conference will deal exclusively with questions relating to seamen, it is considered desirable that Government and non-Government delegates should be fully competent to deal with maritime affairs.

A questionnaire prepared by the International Labor Office has been submitted to the various Governments and interested persons. The answers of the Government of the United States to this questionnaire have been made by the Department of Labor and present a summary of the general working conditions of American seamen. In the majority of cases it has been impossible to follow the classification under 1 of the preliminary note, owing to the fact that the laws are, in the main, general in their scope. It is only when they are specially excepted from the provisions of a law that any particular kinds of vessels are mentioned. This Government has made little distinction in its laws between navigation of inland waterways and maritime navigation, and the same statutes apply to both classes of navigation. A distinction has been made, however, between persons employed on mechanically driven vessels on large lakes or rivers, whose duty is continuous, and those employed on vessels confined to canals or canalized rivers. Navigation on the Great Lakes and the large navigable rivers is governed, in most cases, by the same laws that regulate transoceanic and coastwise shipping. Those who work in vessels confined to canals or canalized rivers are subject to the local laws of the various States. The preliminary note and questionnaire follow:

^a Compiled by M. C. Frincke, jr.

¹ See p. 2.

Conference of Seamen. Questionnaire.

PRELIMINARY NOTE.

In your answers to these inquiries you are requested to bear the following points in mind—

1. Careful allowance should be made in every answer for the distinctions drawn by legislation or custom in your country between the various kinds of vessels; for instance:

(1) Foreign-going merchantmen:

(a) Steamers and other mechanically driven vessels.

(b) Sailing ships.

(2) Coasting vessels.

(3) Tugs and barges not self-propelled.

(4) Fishing boats.

(5) Vessels employed on inland waterways.

2. In your replies, which are invited in order that international agreements and recommendations may be drawn up, you are requested to state how far you think it possible, or advisable, to apply the same general regulations to the various classes of ships, or whether separate arrangements should be made for them.

3. As regards navigation of inland waterways:

(a) Does your Government think that this should be subject to the same regulations as maritime navigation?

(b) Does your Government think it possible to make a distinction between persons employed in mechanically driven vessels on large lakes or rivers, whose duty is continuous, and those employed in vessels confined to canals or canalized rivers?

[It will be recalled that at the Washington Conference during the debate on the Report of the Commission on Hours of Work (Provisional Record, pp. 314-322) attention was drawn by several delegates to the peculiar conditions affecting inland navigation on the Great Lakes of Northern America, the Swedish fiords, and the great rivers of Asia, on which voyages often continue without interruption for several days. In defining the application of the Conventions which may be drawn up in regard to the various items of the agenda, it will be necessary to take these special conditions into account and perhaps to distinguish them from those of river and canal navigation in Europe.]

ITEM I OF THE AGENDA.

*Hours of Labor and their Effect on Manning and Accommodation.*A. *Hours of labor.*

1. Please explain fully the nature of any existing regulations (i) in the national law (ii) in agreements between organizations of ship owners and seamen prescribing the hours of duty for foreign-going seamen.

N. B.—The reply should, where necessary, distinguish between the various classes of seamen (deck hands, engine-room staff and general service) and between the hours of labor while at sea and in port.

2. What arrangements and adjustments does your Government consider necessary for the application to seamen of the 8-hour day and the 48-hour week, as adopted by the Washington Conference?

B. *Manning.*

1. Are there any manning regulations in your national legislation, at any rate for foreign-going vessels?

2. If the principle of the 8-hour day and the 48-hour week were adopted in the mercantile marine:

(a) What modifications do you anticipate in your manning regulations, if you have any?

(b) Does your Government see any objection to the adoption of international manning scales, at any rate for foreign-going vessels?

C. Accommodation.

1. What provision, if any, is made:

(a) By your national law;

(b) By agreements between organizations of ship owners and seamen;

In regard to the amount of cubic space to be allotted to seamen and in regard to their general accommodation?

2. As the application to seamen of the principle of the 8-hour day would probably involve larger crews, what steps would you propose to take, and within what period, to adapt their accommodation to these new requirements?

3. Is it advisable to establish by agreement the international regulation of accommodation for seamen on board ship?

Does your Government think it advisable to fix by international agreements uniform standards of accommodation for seamen on board ship?

ITEM II OF THE AGENDA.**A. Articles of agreement.**

Under what system are seamen in your country engaged?

(a) Are all seamen required to sign articles of agreement? If so, please give particulars of the legal requirements as to the signature of articles.

(b) What provisions exist for insuring the observance of agreements—

(1) By State supervision?

(2) By trade-unions?

(3) By other means?

B. Facilities for finding employment for seamen.

1. Have you in your country any system for registering the service of seamen?

2. Does your national law provide employment exchanges for seamen?

(a) If so, how are they constituted and controlled?

(b) What connection have they with the official authorities who control seamen's employment?

C. Washington conventions and recommendations on unemployment and unemployment insurance.

What provisions or modifications, if any, do you consider necessary for the application to seamen:

(a) Of the draft convention?

(b) Of the recommendations adopted at Washington in regard to unemployment and unemployment insurance?

ITEM III OF THE AGENDA.*Prohibition of the Employment of Children under 14 Years of Age.*

1. What limitations are imposed by your national law on the age at which children may be employed on board ship?

2. What arrangements and adjustments does your Government consider necessary for the application to the mercantile marine of the draft convention adopted at Washington prohibiting the employment of children under 14 years of age?

ITEM IV OF THE AGENDA.*The Possibility of Establishing an International Code for Seamen.*

1. Do you think it possible to establish a kind of international code for seamen?

2. If so, what does your Government consider should be the general principles of an international maritime code as regards the conditions of service at sea?

In particular, should the seamen's contract of employment be brought into line or not with that obtaining generally in the case of other workers: For instance, for discipline, the right to leave their ship in a foreign port, the payment of wages before discharge, etc?

N. B.—The governing body of the International Labor Office, at its meeting in January when the agenda of this questionnaire was drawn up, had this important question brought before it.

The governing body considered it so vast and bound up with so many other problems that the coming international conference would hardly be able to deal with it. In spite of this, it deemed it necessary to retain the question in that agenda for general examination. We should be glad if you would send us forthwith the most complete information available on this subject, particularly on those points which might ultimately give rise to international agreements, in order that the work which will be subsequently necessary may be put in hand.

The discussion of the questions which follow observes the same order as that of the questionnaire, but opinions as to the future policy of this Government are not expressed.

Item I of the Agenda.

Hours of Labor.

IN general it may be said that the principle of the 8-hour day has been accepted by American transoceanic and coastwise shipping and the hours of labor of officers and seamen are now commonly limited by agreements to 8 in every 24. The laws of the United States do not, however make any distinction in kinds of service other than that of officers and seamen, the term "seaman" including "every person (apprentices excepted) who shall be employed or engaged to serve in any capacity on board a vessel" (Revised Statutes, sec. 4612). The statutes provide that the duty of officers shall not exceed 9 hours of any 24 while in port, nor, except in emergency, 12 in any 24 at sea. For seamen in all merchant vessels exceeding 100 tons gross, these same rules prevail, except that while at sea firemen, oilers, and water tenders must be divided into at least three watches and other sailors at least two. Certain days to be recognized as days of rest and holidays are also designated. Fishing and whaling vessels and yachts are exempted from the provisions of this law. The two following statutes comprise all existing legislation on the subject by the Federal Government:

SEC. 2. In all merchant vessels of the United States of more than 100 tons gross, excepting those navigating rivers, harbors, bays, or sounds exclusively, the sailors shall, while at sea, be divided into at least two, and the firemen, oilers, and water tenders into at least three watches, which shall be kept on duty successively for the performance of ordinary work incident to the sailing and management of the vessel.
* * * While such vessel is in a safe harbor no seaman shall be required to do any unnecessary work on Sundays or the following named days: New Year's Day, the Fourth of July, Labor Day, Thanksgiving Day, and Christmas Day, but this shall

not prevent the dispatch of a vessel on regular schedule or when ready to proceed on her voyage. And at all times when such vessel is in a safe harbor, 9 hours, inclusive of the anchor watch, shall constitute a day's work. Whenever the master of any vessel shall fail to comply with this section, the seamen shall be entitled to discharge from such vessel and to receive the wages earned. But this section shall not apply to fishing or whaling vessels, or yachts. [Navigation Laws of the United States, 1919, p. 101.]

SEC. 3. It shall be unlawful for the master, owner, agent, or other person having authority to permit an officer of any vessel to take charge of the deck watch of the vessel upon leaving or immediately after leaving port, unless such officer shall have had at least 6 hours off duty within the 12 hours immediately preceding the time of sailing, and no licensed officer on any ocean or coastwise vessel shall be required to do duty to exceed 9 hours of any 24 while in port, including the date of arrival, or more than 12 hours of any 24 at sea, except in a case of emergency when life or property is endangered. Any violation of this section shall subject the person or persons guilty thereof to a penalty of \$100. Approved May 11, 1918. [Navigation Laws of the United States, 1919, p. 126.]

Various agreements concerning hours have been entered into by the United States Shipping Board, the American Steamship Association, and associations of employees. The working rules agreed upon between these two organizations and the American Association of Masters, Mates, and Pilots and the Neptune Association fix the hours of labor for licensed officers in the home port at 8 a. m. to 5 p. m. with one hour for dinner, and on week days in port, work performed before and after these hours shall be paid at overtime rates. Watch and watch shall be maintained on sailing day and at all outside ports and ports of call. At sea, except in case of danger to the vessel, no mate shall be allowed to work more than 8 hours.² These regulations apply to ocean and coastwise trade, but not to the Great Lakes.

On the Great Lakes the hours of labor are governed by the Federal statutes already quoted. The Lake Carriers' Association, an organization of ship owners representing about 80 per cent of the tonnage on the lakes, refused in 1908 to enter into agreements with the union of seamen.³ This stand was adhered to by the association and most of the other ship owners until the fall of 1917, when a minimum wage schedule was established and the abolition of the continuous-discharge-book system secured through an agreement between the association, the United States Shipping Board, and representatives of the seamen. This agreement has lapsed since the signing of the armistice and is now no longer in effect.

The hours for licensed engineers,⁴ as agreed upon with the Marine Engineers' Beneficial Association and which are effective until Aug-

² Wage scales and working conditions. Trans-Atlantic, Atlantic, and Gulf Coasts. United States Shipping Board. pp. 2, 3.

³ Employment system of the Lake Carriers' Association. Bulletin No. 235 of the U. S. Bureau of Labor Statistics, p. 11.

⁴ Wage scales and working conditions. Trans-Atlantic, Atlantic, and Gulf Coasts. United States Shipping Board. Pp. 3, 4, 5.

ust 1, 1920, are the same as for masters, mates, and pilots, with the further provision that work in excess of 8 hours shall not be performed or paid for unless the work is done upon the written order of the chief engineer, master, owner, or agent of the vessel. An entry shall be made in the log book covering the kind of work, reason for same, and time started and finished, for each time overtime service is performed.

Rules agreed upon with the Eastern and Gulf Sailors' Association,⁵ for unlicensed seamen, fix the same hours of work in port with overtime paid for at special overtime rates, and provide that on vessels carrying more than six men on deck, the wheelmen and lookout men shall be divided into three watches, the remainder of the deck crew to perform any necessary work for a period of 8 hours.

The Marine Cooks' and Stewards' Association⁶ of the Atlantic and Gulf agreed that away from the home port, except for vessels performing daily schedules, the work of employees of the stewards' department (except galley crews) shall be done in 10 hours out of each 24, the galley crew's time to be regulated by the chief cook. Work required between the hours of 8 p. m. and 6 a. m. and, in excess of 10 hours (except for galley crews) between the hours of 6 a. m. and 8 p. m., shall be paid for at overtime rates. Grievances concerning working hours or working of ships are to be settled in the home port and not by stopping work or leaving the ship. These rules were to be effective until May 1, 1920.

The Marine Firemen, Oilers and Watertenders⁷ of the Atlantic and Gulf agreed upon rules effective till May 1, 1920, which included the 8-hour day in port with overtime on week days between 5 p. m. and 8 a. m. and work on Sundays and holidays to be paid for at overtime rates. Wipers are to work two hours on Sundays and holidays at sea. The firemen on ocean-going oil barges shall be divided into three watches, and on ocean-going vessels where coal passers are carried there shall be at least three coal passers and three watches. The law does not permit one man to care for more than four fires on coal-burning vessels.

The United Radio Telegraphers' Association agreed to abide by the same rules as those established for officers; their agreement terminates on August 1, 1920.

Agreements substantially the same in regard to hours of labor as those in effect in the ocean and coastwise trade of the Atlantic Ocean and the Gulf of Mexico have been entered into by seamen's organiza-

⁵ Wage scales and working conditions. Trans-Atlantic, Atlantic, and Gulf Coasts. United States Shipping Board. Pp. 6, 7.

⁶ *Idem*, p. 8.

⁷ *Idem*, pp. 10, 11.

tions on the Pacific coast. These rules were to be effective for one year, from August 1, 1919, to August 1, 1920. The seamen's organizations represented are:

The Licensed Deck Officers' Association, Pacific Coast.

The Marine Cooks' and Stewards' Association of the Pacific Coast.

The Marine Engineers' Beneficial Association.

The Sailors' Union of the Pacific.

The Radio Ship Owners' Service Inc.

While the 8-hour day has been generally accepted by American transoceanic and coastwise shipping there is no demand from the seamen for a 48-hour week, the 56-hour week being considered a matter of necessity considering the nature of work at sea. No further arrangements or adjustments would therefore be necessary for the enactment into law of the 8-hour day as recommended by the Washington Conference.

Manning.

The national statutes state, as regards officers, that there shall be one master for every vessel engaged in ocean or coastwise trade; every vessel of 1,000 gross tons or over shall have on board 3 licensed mates; every vessel of 200 gross tons but less than 1,000 gross tons shall have 2 licensed mates; and every vessel of 100 gross tons or less shall have 1 licensed mate. On the other hand there are no specific requirements as to the number of seamen a vessel must have on board, this matter being left entirely to the discretion of the local steamboat inspectors of the United States Department of Commerce. The number of licensed mates a vessel must have according to the above provisions may be increased in the discretion of the local inspectors.

On merchant vessels of more than 100 tons gross, excepting those navigating rivers, harbors, bays, and sounds, sailors shall be employed for specific duties and shall not be required to work alternately, as in the fireroom or on deck, except in cases of emergency, and no vessel shall depart from any port in the United States unless she has on board a crew of which at least 75 per cent in each department are able to understand any order given by the officers. After the fourth year following the passage of the act in 1915 at least 65 per cent of a vessel's deck crew, exclusive of licensed officers and apprentices, must be of a rating not less than that of able seamen.

In case of desertion or casualty the master must secure if possible an equal number of seamen of the same or a higher rating and report to the United States consul at the first port at which he touches. None of the foregoing provisions apply to fishing or whaling vessels, yachts, or motor boats or to wrecking vessels.

The general statutory regulations relating to the manning of vessels engaged in ocean or coastwise trade are as follows:

Section 4463 of the Revised Statutes of the United States be, and it is hereby, amended [May 11, 1918—Act No. 302] to read as follows:

Sec. 4463. No vessel of the United States subject to the provisions of this title or to the inspection laws of the United States shall be navigated unless she shall have in her service and on board such complement of licensed officers and crew including certificated lifeboat men, separately stated, as may, in the judgment of the local inspectors who inspect the vessel, be necessary for her safe navigation. The local inspectors shall make in the certificate of inspection of the vessel an entry of such complement of officers and crew including certificated lifeboat men, separately stated, which may be changed from time to time by indorsement on such certificate by local inspectors by reason of change of conditions or employment. Such entry or indorsement shall be subject to a right of appeal, under regulations to be made by the Secretary of Commerce, to the supervising inspector and from him to the supervising inspector general, who shall have the power to revise, set aside, or affirm the said determination of the local inspectors.

If any such vessel is deprived of the services of any number of the crew including certificated lifeboat men, separately stated, without the consent, fault, or collusion of the master, owner, or any person interested in the vessel, the vessel may proceed on her voyage if, in the judgment of the master, she is sufficiently manned for such voyage: *Provided*, That the master shall ship, if obtainable, a number equal to the number of those whose services he has been deprived of by desertion or casualty, who must be of the same grade or of a higher rating with those whose places they fill. If the master shall fail to explain in writing the cause of such deficiency in the crew including certificated lifeboat men, separately stated, to the local inspectors within 12 hours of the time of the arrival of the vessel at her destination, he shall be liable to a penalty of \$50. If the vessel shall not be manned as provided in this act, the owner shall be liable to a penalty of \$100, or in case of an insufficient number of licensed officers to pay a penalty of \$500.

That the board of local inspectors shall make an entry in the certificate of inspection of every ocean and coastwise seagoing merchant vessel of the United States propelled by machinery, and every ocean-going vessel carrying passengers, the minimum number of licensed deck officers required for her safe navigation according to the following scale:

That no such vessel shall be navigated unless she shall have on board and in her service one duly licensed master.

That every such vessel of 1,000 gross tons and over, propelled by machinery, shall have in her service and on board three licensed mates, who shall stand in three watches while such vessel is being navigated, unless such vessel is engaged in a run of less than 400 miles from the port of departure to the port of final destination, then such vessel shall have two licensed mates; and every vessel of 200 gross tons and less than 1,000 gross tons, propelled by machinery, shall have two licensed mates.

That every such vessel of 100 gross tons and under 200 gross tons, propelled by machinery, shall have on board and in her service one licensed mate, but if such vessel is engaged in a trade in which the time required to make the passage from the port of departure to the port of destination exceeds 24 hours, then such vessel shall have two licensed mates.

That nothing in this section shall be so construed as to prevent local inspectors from increasing the number of licensed officers on any vessel subject to the inspection laws of the United States, if, in their judgment, such vessel is not sufficiently manned for her safe navigation: *Provided*, That this section shall not apply to fishing or whaling vessels, yachts, or motor boats as defined in the act of June 9, 1910, or to wrecking vessels. [Navigation Laws of the United States, 1919, pp. 125, 126.]

Manning of Merchant Vessels.

In all merchant vessels of the United States of more than 100 tons gross, excepting those navigating rivers, harbors, bays, or sounds exclusively, the sailors shall, while at sea, be divided into at least two, and the firemen, oilers, and water tenders into at least three watches, which shall be kept on duty successively for the performance of ordinary work incident to the sailing and management of the vessel. The seamen shall not be shipped to work alternately in the fireroom and on deck, nor shall those shipped for deck duty be required to work in the fireroom, or vice versa; but

the e provisions shall not limit either the authority of the master or other officer or the obedience of the seamen when, in the judgment of the master or other officer, the whole or any part of the crew are needed for the maneuvering of the vessel or the performance of work necessary for the safety of the vessel or her cargo, or for the saving of life aboard other vessels in jeopardy, or when in port or at sea from requiring the whole or any part of the crew to participate in the performance of fire, life-boat, and other drills. * * *

No vessel of 100 tons gross and upward, except those navigating rivers exclusively and the smaller inland lakes and except as provided in section 1 of this act, shall be permitted to depart from any port of the United States unless she has on board a crew not less than 75 per cent of which, in each department thereof, are able to understand any order given by the officers of such vessel, nor unless 40 per cent in the first year, 45 per cent in the second year, 50 per cent in the third year, 55 per cent in the fourth year after the passage of this act, and thereafter 65 per cent of her deck crew, exclusive of licensed officers and apprentices, are of a rating not less than able seamen. Every person shall be rated an able seaman, and qualified for service as such on the seas, who is 19 years of age or upward, and has had at least three years' service on deck at sea or on the Great Lakes, on a vessel or vessels to which this section applies, including decked fishing vessels, naval vessels or Coast Guard vessels; and every person shall be rated an able seaman, and qualified to serve as such on the Great Lakes and on the smaller lakes, bays, or sounds, who is 19 years of age or upward and has had at least 18 months' service on deck at sea or on the Great Lakes or on the smaller lakes, bays, or sounds, on a vessel or vessels to which this section applies, including decked fishing vessels, naval vessels, or Coast Guard vessels; and graduates of school ships approved by and conducted under rules prescribed by the Secretary of Commerce may be rated able seamen after 12 months' service at sea: *Provided*, That upon examination under rules prescribed by the Department of Commerce as to eyesight, hearing, and physical condition, such persons or graduates are found to be competent: *Provided further*, That upon examination, under rules prescribed by the Department of Commerce as to eyesight, hearing, physical condition, and knowledge of the duties of seamanship a person found competent may be rated as able seaman after having served on deck 12 months at sea, or on the Great Lakes; but seamen examined and rated able seamen under this proviso shall not in any case compose more than one-fourth of the number of able seamen required by this section to be shipped or employed upon any vessel.

Any person may make application to any board of local inspectors for a certificate of service as able seaman, and upon proof being made to said board by affidavit and examination, under rules approved by the Secretary of Commerce, showing the nationality and age of the applicant and the vessel or vessels on which he has had service and that he is entitled to such certificate under the provisions of this section the board of local inspectors shall issue to said applicant a certificate of service, which shall be retained by him and be accepted as *prima facie* evidence of his rating as an able seaman.

Each board of local inspectors shall keep a complete record of all certificates of service issued by them and to whom issued and shall keep on file the affidavits upon which said certificates are issued. [Act of Mar. 4, 1915, sec. 13. Effective on American vessels beginning Nov. 4, 1915; on vessels of foreign nations not covered by treaties Mar. 4, 1916; on vessels of other foreign nations after termination of treaties.]

Undermanning.

In case of desertion or casualty resulting in the loss of one or more of the seamen, the master must ship, if obtainable, a number equal to the number of those whose services he has been deprived of by desertion or casualty, who must be of the same

or higher grade or rating with those whose places they fill, and report the same to the United States consul at the first port at which he shall arrive, without incurring the penalty prescribed by the two preceding sections. This section shall not apply to fishing or whaling vessels or yachts. [Revised Statutes, sec. 4516. Act of Dec. 21, 1898, sec. 1; act of Mar. 4, 1915, sec. 1. Effective beginning Nov. 4, 1915. Navigation Laws of the United States, 1919, pp. 101-103.]

The agreement between the American Steamship Association and the Marine Firemen, Oilers, and Watertenders of the Atlantic and Gulf, an agreement concurred in and approved by the United States Shipping Board, requires all ocean-going vessels of 500 tons gross or over that carry coal passers to carry not less than three coal passers whose sea watches shall be divided into three and in no case is one man to be required to care for more than four fires on coal-burning vessels or 12 fires on oil-burning vessels.

The above rules also establish the standard crew complements in the deck and engine departments on vessels manned by the United States Shipping Board. These rules are also alterable when the circumstances warrant a change. It must be remembered, however, that the rules of this board are in no sense law nor are they obligatory upon other ship owners. They do serve, however, to establish what might be termed the American standard for manning foreign-going ocean and coastwise vessels. The following statement is reproduced from the report of the Marine and Dock Industrial Relations Division of the United States Shipping Board.⁸

Under date of February 1, 1919, the Division of Operations of the United States Shipping Board announced the adoption of the following standard crew complements to be carried in the deck and engine departments of all vessels operated by the Shipping Board:

Deck department.

Position.	Cargo vessels having dead-weight tonnage of—									
	3,000	4,000	5,000	6,000	7,000	8,000	9,000	10,000	11,000	
Master.....	1	1	1	1	1	1	1	1	1	
Mates.....	3	3	3	3	3	3	3	3	3	
Carpenter.....	1	1	1	1	1	1	1	1	1	
Boatswain.....	1	1	1	1	1	1	1	1	1	
Able seamen.....	4	4	4	6	6	6	7	7	7	
Ordinary seamen.....	2	2	2	2	2	2	3	3	3	
Total.....	12	12	12	14	14	14	16	16	16	

⁸ Marine and dock labor; work, wages, and industrial relations during the period of the war. Report of the Director of the Marine and Dock Industrial Relations Division, United States Shipping Board, submitted to the board as of Dec. 31, 1918. Washington, 1919. Pp. 188, 189.

Engine department.

Position.	Cargo vessels having indicated horsepower of—								
	1,000	1,250	1,500	1,750	2,000	2,250	2,500	2,750	3,000
<i>Coal-burning vessels.</i>									
Chief engineer.....	1	1	1	1	1	1	1	1	1
Assistant engineers.....	3	3	3	3	3	3	3	3	3
Deck engineer.....				1	1	1	1	1	1
Storekeepers.....						1	1	1	1
Oilers.....	3	3	3	3	3	3	3	3	3
Water tenders (not carried on vessels unless fitted with 2 or more water- tube boilers).....								3	3
Firemen.....	3	6	6	6	6	9	9	9	9
Coal passers.....	3	3	3	3	3	6	6	6	6
Total.....	13	16	16	17	17	24	24	27	27
<i>Oil-burning vessels.</i>									
Chief engineer.....	1	1	1	1	1	1	1	1	1
Assistant engineers.....	3	3	3	3	3	3	3	3	3
Deck engineer.....				1	1	1	1	1	1
Storekeepers.....								1	1
Oilers.....	3	3	3	3	3	3	3	3	3
Water tenders (not carried on vessels unless fitted with 2 or more water- tube boilers).....								3	3
Firemen.....	3	3	3	3	3	3	3	3	3
Wipers.....	2	2	2	2	2	3	3	3	3
Total.....	12	12	12	13	13	14	14	18	18

In addition to the above, vessels of the Shipping Board carry a supercargo and sometimes one or two clerks. One wireless operator is carried, unless there are over 50 persons on board, in which case the law requires two.

The figures given for firemen, coal passers, and water tenders are subject to some fluctuation, depending on the arrangement of the boilers and bunkers.

Shipping Board vessels carry six or more persons in the stewards' department; but work on the standardization of this department is still in progress (March, 1919).

Accommodation.

The national laws make fairly careful and complete provisions for the accommodations of the crews of merchant vessels of not less than 100 tons register including river steamboats, but excluding yachts and pilot boats. These provisions are found in section 4153, Revised Statutes, which prescribes how much space for the use of the crew may be deducted from the gross tonnage of a vessel in arriving at its register tonnage. Vessels, the construction of which was commenced before March 4, 1915, are required to allow 120 cubic feet to each seaman or apprentice and not less than 16 square feet measured on the floor or deck for each member of the crew. Not more than one berth shall be placed above another. The quarters must be well constructed, ventilated, and properly lighted, and made secure from bilge water. Other legal requirements fix the minimum food allowances and provide for slop chests, medicines, mess rooms,

washing facilities, and warm clothing. Section 4153, Revised Statutes, in part is as follows:

From the gross tonnage of every vessel of the United States there shall be deducted—

(a) The tonnage of the spaces or compartments occupied by or appropriated to the use of the crew of the vessel. Every place appropriated to the crew of the vessel shall have a space of not less than 72 cubic feet and not less than 12 superficial feet, measured on the deck or floor of that place, for each seaman or apprentice lodged therein. The provisions of this act requiring a crew space of 72 cubic feet per man shall apply only to vessels the construction of which shall be begun after June 30, 1895. Such place shall be securely constructed, properly lighted, drained, and ventilated, properly protected from weather and sea, and as far as practicable properly shut off and protected from the effluvium of cargo or bilge water; and failure to comply with this provision shall subject the owner to a penalty of \$500. Every place so occupied shall be kept free from goods or stores of any kind not being the personal property of the crew in use during the voyage; and if any such place is not so kept free the master shall forfeit and pay to each seaman or apprentice lodged in that place the sum of 50 cents a day for each day during which any goods or stores as aforesaid are kept or stored in the place after complaint has been made to him by any two or more of the seamen so lodged. No deduction from tonnage as aforesaid shall be made unless there is permanently cut in a beam and over the doorway of every such place the number of men it is allowed to accommodate with these words, "Certified to accommodate —— seamen."

On all merchant vessels of the United States the construction of which shall be begun after the passage of this act, except yachts, pilot boats, or vessels of less than 100 tons register, every place appropriated to the crew of the vessel shall have a space of not less than 120 cubic feet and not less than 16 square feet, measured on the floor or deck of that place, for each seaman or apprentice lodged therein, and each seaman shall have a separate berth and not more than one berth shall be placed one above another; such place or lodging shall be securely constructed, properly lighted, drained, heated, and ventilated, properly protected from weather and sea, and, as far as practicable, properly shut off and protected from the effluvium of cargo or bilge water. And every such crew space shall be kept free from goods or stores not being the personal property of the crew occupying said place in use during the voyage. [Mar. 3, 1897, sec. 2; Mar. 4, 1915, sec. 6. Effective beginning Nov. 4, 1915.]

That in addition to the space allotment for lodgings hereinbefore provided, on all merchant vessels of the United States which in the ordinary course of their trade make voyages of more than three days' duration between ports, and which carry a crew of 12 or more seamen, there shall be constructed a compartment, suitably separated from other spaces, for hospital purposes, and such compartment shall have at least one bunk for every 12 seamen, constituting her crew: *Provided*, That not more than six bunks shall be required in any case.

Every steamboat of the United States plying upon the Mississippi River or its tributaries shall furnish an appropriate place for the crew, which shall conform to the requirements of this section, so far as they are applicable thereto, by providing sleeping room in the engine room of such steamboat, properly protected from the cold, wind, and rain by means of suitable awnings or screens on either side of the guards or sides and forward, reaching from the boiler deck to the lower or main deck, under the direction and approval of the supervising inspector general of steam vessels, and shall be properly heated.

All merchant vessels of the United States, the construction of which shall be begun after the passage of this act having more than 10 men on deck must have at least one light, clean, and properly ventilated washing place. There shall be provided at least one washing outfit for every two men of the watch. The washing place shall

be properly heated. A separate washing place shall be provided for the fireroom and engine-room men, if their number exceed 10, which shall be large enough to accommodate at least one-sixth of the men at the same time, and have hot and cold water supply and a sufficient number of washbasins, sinks, and shower baths.

Any failure to comply with this section shall subject the owner or owners of such vessel to a penalty of not less than \$50 nor more than \$500: *Provided*, That forecastles shall be fumigated at such intervals as may be provided by regulations to be issued by the Surgeon General of the Public Health Service, with the approval of the Department of Commerce, and shall have at least two exits, one of which may be used in emergencies. [Navigation Laws of the United States, 1919, pp. 29-31.]

Section 4572 (Dec. 21, 1898) provides that "every vessel in foreign or domestic trade shall provide a safe and warm room for the use of seamen in cold weather," but this section is not applicable to fishing or whaling vessels or yachts. (Navigation Laws of the United States, 1919, p. 112.)

It is also provided that "the local inspectors shall, once in every year, at least, carefully inspect * * * each steam vessel within their respective districts, and shall satisfy themselves that every such vessel * * * has suitable accommodations for the crew." (Sec. 4417, Revised Statutes, as amended. Navigation Laws of the United States, 1919, p. 104.)

These laws are all general in their scope and unless otherwise specified therein they apply to all vessels under the jurisdiction of the Federal Government, whether engaged in ocean, coastwise, lake or river transportation.

The national law also makes careful provisions for the supplying of the crews of vessels with proper food, including 5 quarts of fresh water daily. Fishing or whaling vessels or yachts are exempt from these requirements. The following extract from the Revised Statutes shows the nature of these requirements:

SCALE OF PROVISIONS TO BE ALLOWED AND SERVED OUT TO CREW DURING THE VOYAGE.

(Revised Statutes, sec. 4612; act of Dec. 21, 1898, sec. 23; act of Mar. 4, 1915, sec. 10. Navigation Laws of the United States, 1919, pp. 96, 97.)

Article.	Unit.	Sun.	Mon.	Tues.	Wed.	Thurs.	Fri.	Sat.
Beef, salt.....	Pound			1½		1½		1½
Pork, salt.....	do.		1		1		1

Vinegar.....	do.			½				½
Mustard, pepper, and salt sufficient for seasoning.....	do.							

Substitutes.

One pound of flour daily may be substituted for the daily ration of biscuit or fresh bread; two ounces of desiccated vegetables for 1 pound of potatoes or yams; 6 ounces of hominy, oatmeal, or cracked wheat, or 2 ounces of tapioca, for 6 ounces of rice; 6 ounces of canned vegetables for one-half pound of canned tomatoes; one-eighth of an ounce of tea for three-fourths of an ounce of coffee; three-fourths of an ounce of coffee for one-eighth of an ounce of tea; 6 ounces of canned fruit for 3 ounces of dried fruit; one-half ounce of lime juice for the daily ration of vinegar; 4 ounces of oatmeal or cracked wheat for one-half pint of corn meal; 2 ounces of pickled onions for 4 ounces of fresh onions.

When the vessel is in port and it is possible to obtain the same, $1\frac{1}{2}$ pounds of fresh meat shall be substituted for the daily rations of salt and canned meat; one-half pound of green cabbage for one ration of canned tomatoes; one-half pound of fresh fruit for one ration of dried fruit. Fresh fruit and vegetables shall be served while in port if obtainable. The seamen shall have the option of accepting the fare the master may provide but the right at any time to demand the foregoing scale of provisions. The foregoing scale of provisions shall be inserted in every article of agreement and shall not be reduced by any contract, except as above, and a copy of the same shall be posted in a conspicuous place in the galley and in the forecabin of each vessel. Fishing or whaling vessels or yachts exempt. [Act of Dec. 21, 1898, sec. 26. Navigation Laws of the United States, 1919, pp. 96, 97.]

In addition to the various foregoing provisions for the welfare and comfort of seamen, the national laws also make other requirements for their benefit. Sections 4564 to 4568 (Navigation Laws of the United States, 1919, pp. 109, 110) make careful provisions designed to require masters of vessels to maintain an ample supply of fresh water and provisions on board their ships. Medicines and anti-scorbutics are required to be provided by sections 4569 and 4570. (Navigation Laws of the United States, 1919, p. 111.) Certain vessels are also required to carry slop chests and detailed provisions as to their contents are prescribed. (Revised Statutes, sec. 4569, acts of June 26, 1884, sec. 11, and June 19, 1886, sec. 13. Navigation Laws of the United States, 1919, pp. 111, 112.) Provisions for a warm room and clothing are made by the provisions of section 4572 of the Revised Statutes. (Navigation Laws of the United States, 1919, p. 112.)

The rules of the United States Shipping Board for deck and engine-room crews require that proper bedding—mattresses, pillows, spreads, blankets, and linen, etc.—shall be furnished each member of the crew and that the engine-room crew be provided with a mess room. These requirements in practically the same form are also found in the working rules of the various classes of unlicensed seamen. These rules were established by agreements between the United States Shipping Board, the American Steamship Association, and the following organizations of seamen: Eastern and Gulf Sailors' Association; Marine Cooks' and Stewards' Association of the Atlantic and Gulf; Marine Firemen, Oilers, and Watertenders of the Atlantic

and Gulf; Marine Cooks' and Stewards' Association of the Pacific Coast; Marine Firemen, Oilers, and Watertenders of the Pacific; Sailors' Union of the Pacific.

The rules of the last-named association also call for a mess room for the accommodation of the crew which shall be so constructed as to afford a sitting room for all and so situated as to be protected from the weather and the heat and odor from the engine room.

Item II of the Agenda.

Articles of Agreement.

THE seamen of this country are not engaged according to any particular system. The law imposes the duty of providing facilities for the employment of seamen upon the shipping commissioners, but Congress has never appropriated any money to be devoted to this purpose, and as a consequence no such facilities are available. (See Navigation Laws of the United States, 1919, pp. 64, 65, 66.)

All seamen on a vessel destined for a foreign port (Mexico, Canada, and the West India Islands excepted) are required to sign articles of agreement. These documents are a part of a ship's papers and must be signed by the seamen and the master in the presence of a United States shipping commissioner. The articles must contain the nature and duration of the voyage, the number and description of the crew, the time when the seaman is to be on board to begin work, the capacity in which the seaman is to serve, the amount of wages, the scale of provisions, the regulations as to conduct on board the vessel, fines, etc., and stipulations as to the allotment of wages. These requirements are set out more fully in the following extract from the Revised Statutes (sec. 4511):

Agreement to Ship in Foreign Trade.

The master of every vessel bound from a port in the United States to any foreign port other than vessels engaged in trade between the United States and the British North American possession, or the West India Islands, or the Republic of Mexico, or of any vessel of the burden of 75 tons or upward, bound from a port on the Atlantic to a port on the Pacific, or vice versa, shall, before he proceeds on such voyage, make an agreement, in writing or in print, with every seaman whom he carries to sea as one of the crew, in the manner hereinafter mentioned; and every such agreement shall be, as near as may be, in the form given in the table marked A, in the schedule annexed to this title [R. S. 4501-4613], and shall be dated at the time of the first signature thereof, and shall be signed by the master before any seaman signs the same, and shall contain the following particulars:

First. The nature and, as far as practicable, the duration of the intended voyage or engagement, and the port or country at which the voyage is to terminate.

Second. The number and description of the crew, specifying their respective employments.

Third. The time at which each seaman is to be on board, to begin work.

Fourth. The capacity in which each seaman is to serve.

Fifth. The amount of wages which each seaman is to receive.

Sixth. A scale of the provisions which are to be furnished to each seaman.

Seventh. Any regulations as to conduct on board and as fines, short allowances of provisions, or other lawful punishments for misconduct, which may be sanctioned by Congress or authorized by the Secretary of Commerce and Labor not contrary to or not otherwise provided for by law, which the parties agreed to adopt. [Mar. 3, 1897, sec. 19; Feb. 14, 1903, sec. 10.]

Eighth. Any stipulations in reference to allotment of wages, or other matters not contrary to law. [Repealed so far as relates to allotments in trade between the United States, Dominion of Canada, Newfoundland, the West Indies, and Mexico, and coasting trade of the United States, except between Atlantic and Pacific ports, by section 25 of act of December 21, 1898;] (Revised Statutes, sec. 4511) June 26, 1884, section 10; December 24, 1898, section 25. [Navigation Laws of the United States, 1919, pp. 66, 67.]

The following rules shall be observed with respect to agreements (Revised Statutes, sec. 4512):

First. Every agreement, except such as are otherwise specially provided for, shall be signed by each seaman in the presence of a shipping commissioner.

Second. When the crew is first engaged the agreement shall be signed in duplicate, and one part shall be retained by the shipping commissioner, and the other part shall contain a special place or form for the description and signatures of persons engaged subsequently to the first departure of the ship, and shall be delivered to the master.

Third. Every agreement entered into before a shipping commissioner shall be acknowledged and certified under the hand and official seal of such commissioner. The certificate of acknowledgment shall be indorsed on or annexed to the agreement, and shall be in the following form:

State of, County of

On this day of, personally appeared before me, a shipping commissioner in and for the said county, A. B., C. D., and E. F., severally known to me to be the same persons who executed the foregoing instrument, who each for himself acknowledged to me that he had read or had heard read the same; that he was by me made acquainted with the conditions thereof, and understood the same; and that, while sober and not in a state of intoxication, he signed it freely and voluntarily, for the uses and purposes therein mentioned.

Section 4511 shall not apply to masters of vessels where the seamen are by custom or agreement entitled to participate in the profits or result of a cruise or voyage, nor to masters of coastwise nor to masters of lake-going vessels that touch at foreign ports; but seamen may, by agreement, serve on board such vessels a definite time, or, on the return of any vessel to a port in the United States, may reship and sail in the same vessel on another voyage, without the payment of additional fees to the shipping commissioner. [Revised Statutes, sec. 4513, Feb. 18, 1895. June 19, 1886.]

[NOTE.—Section 4511, however, does apply in part to masters of coastwise vessels whose crews are shipped under provisions of the act of Feb. 18, 1895.]

The master shall, at the commencement of every voyage or engagement, cause a legible copy of the agreement, omitting signatures, to be placed or posted up in such part of the vessel as to be accessible to the crew; and on default shall be liable to a penalty of not more than \$100. [Revised Statutes, sec. 4519. Navigation Laws of the United States, 1919, pp. 67, 68.]

Shipment in Foreign Ports Before Consuls.

Every master of a merchant vessel who engages any seaman at a place out of the United States, in which there is a consular officer or commercial agent, shall, before carrying such seaman to sea, procure the sanction of such officer, and shall engage

seamen in his presence; and the rules governing the engagement of seamen before a shipping commissioner in the United States shall apply to such engagements made before a consular officer or commercial agent; and upon every such engagement the consular officer or commercial agent shall indorse upon the agreement his sanction thereof, and an attestation to the effect that the same has been signed in his presence, and otherwise duly made. [Revised Statutes, sec. 4517. Navigation Laws of the United States, 1919, p. 69.]

The legal requirements for the signature of articles of agreement of seamen are somewhat different on sail or steam vessels engaged in the coastwise trade (except between the Atlantic and Pacific coasts), on vessels engaged in foreign trade on the Great Lakes, or on vessels where the seamen are entitled to a share in the profits of a cruise. The chief points of difference are that in this class of trade the articles of agreement do not have to contain stipulations as to the scale of provisions to which each seaman is entitled nor do they have to contain provisions for the allotment of wages. (Navigation Laws of the United States, 1919, pp. 72, 73.)

If a master takes any seaman or mariner to sea on a vessel bound from one State to another nonadjoining State without first signing a contract of agreement as required by law, then the seaman so unlawfully shipped shall be entitled to the highest wages paid at the port where he was shipped and in addition the master will be liable to the payment of a fine of \$20, half of which goes to the seaman. (Navigation Laws of the United States, 1919, pp. 73, 74.)

If a seaman has any cause for complaint he may have his case arbitrated by a shipping commissioner provided the master also consents, in which case his decision is final, but either party may refuse arbitration and resort to action in the Federal courts. (Navigation Laws of the United States, 1919, pp. 85, 86.)

Further protection is accorded seamen by insuring the observance of shipping agreements in so far as they relate to wages, by requiring that seamen be discharged before a shipping commissioner if in America, or a consular officer if in a foreign port. When a seaman is so discharged the master is required to pay the wages due the seaman in the presence of said shipping commissioner or consul. (Navigation Laws of the United States, 1919, pp. 76-78.)

The working rules established by agreements with the seamen's unions provide that in doubtful cases and cases of dispute the employee should do as his officers require and refer the matter in question to the union for settlement.

The Marine Engineers' Beneficial Association, by rule 12 of the working rules agreed upon by them and the ship owners, provides that if, after investigation, it is found that any member of the association was discharged for the observance of the rules, no other member would be permitted to work with his substitute. This association consists of licensed engineer officers.

Facilities for Registering Seamen and Finding Employment for Them.

It is a part of the duties of the shipping commissioners to keep a register of the names of seamen and their characters. The issuance of certificates of service to qualify ordinary or apprentice seamen for a rating as able seamen is intrusted to the boards of local inspectors who are under the Department of Commerce. It is also incumbent upon the local inspectors to keep complete records of all certificates of service issued by them. Penalties are imposed upon any shipping commissioner or clerk who unlawfully demands or receives a fee for his services. The provisions of the laws imposing these obligations are as follows:

Shipping Officers.

The general duties of a shipping commissioner shall be:

First. To afford facilities for engaging seamen by keeping a register of their names and characters.

Second. To superintend their engagement and discharge, in manner prescribed by law.

Third. To provide means for securing the presence on board at the proper time of men who are so engaged.

Fourth. To facilitate the making of apprenticeships to the sea service.

Fifth. To perform such other duties relating to merchant seamen or merchant ships as are now or may hereafter be required by law. [Revised Statutes, sec. 4508.]

In any port in which no shipping commissioner shall have been appointed, the whole or any part of the business of a shipping commissioner shall be conducted by the collector or deputy collector of customs of such port; and in respect of such business such customhouse shall be deemed a shipping office, and the collector or deputy collector of customs to whom such business shall be committed shall, for all purposes, be deemed a shipping commissioner within the meaning of this title [R. S., 4501-4613]. [Revised Statutes 4503.]

The laws prescribe the various periods of service necessary to qualify men to become able seamen. When a seaman has acquired the necessary qualifications to entitle him to serve as an able seaman he may make application to any board of local inspectors for a certificate of service as able seaman. The board of local inspectors after giving the applicant an examination issues him a certificate and records it.

The national law does not specifically provide employment exchanges for seamen, although the placement of seamen was included during the war by the Federal employment offices⁹ as part of their general activities. The United States Shipping Board maintained a recruiting system during the war and still continues its training ships for the purpose of training young men for the sea service, both on its own vessels and on those of other shipowners. In New York City there is maintained what is called the Sea Service Bureau for the placement of seamen, but this is not a Federal employment exchange. The various seamen's unions afford facilities for the securing of

⁹ For discussion of the United States Employment Service, see pp. 127-140.

employment for their members. The transportation companies also make use of various charitable institutions which devote their attention to the needs of seamen.

Washington Conventions and Recommendations on Unemployment and Unemployment Insurance.

The Federal Government has at present no power to establish an all-inclusive system of unemployment insurance. The individual States could do so, but none has taken such action. (Massachusetts and New York have both considered bills on the subject. Other States have conducted or are now conducting investigations.) It is a matter of dispute whether the United States, by becoming a party to the League of Nations, and accepting the draft conventions affecting labor, would thereby acquire the authority under our Constitution to legislate to carry the terms of those conventions directly into effect. Some of our best constitutional lawyers hold that a treaty once entered into becomes "the supreme law of the land" regardless of State legislation to the contrary. The only question to be determined by the Federal Supreme Court, in the view of these lawyers, is whether the subject matter of the treaty is a matter which may properly be referred for international negotiations. Other interpreters of the Constitution hold very vigorously that jurisdiction over labor matters, except in so far as expressly granted to the Federal Government, is among the things "reserved to the States and to the people thereof," and can not be dealt with by the Federal Government by treaty any more than by legislation in the absence of a treaty. The Federal Government could, however, immediately establish an unemployment insurance system taking in all seamen engaged in both foreign and interstate commerce.

It would not be within the power of Congress at present directly to legislate out of existence private employment agencies charging fees for their services. The Supreme Court has declared unconstitutional a law enacted by the State of Washington (U. S. Supreme Court Reports, vol. 37, p. 662; Bulletin No. 246 of the United States Bureau of Labor Statistics, pp. 108-112), which forbade the taking of fees from workmen for securing employment for them. The majority opinion—the court divided 5 to 4—states: "There is nothing inherently immoral or dangerous to public welfare in acting as a paid representative of another to find a position in which he can earn an honest living." The prohibition in question was held by the court to be an arbitrary interference with the right to contract and to carry on business guaranteed by the fourteenth amendment to the Constitution. This decision, however, would in no way interfere with the placing of seamen without charging fees by governmental agencies—such as the shipping commissioners now in existence.

Item III of the Agenda.

Prohibition of the Employment of Children Under 14 Years of Age.

THE age fixed by law (Revised Statutes, secs. 4509, 4510) at which boys may be apprenticed to the sea service is 12 years. The period of apprenticeship terminates when the boy arrives at the age of 18 years. (Navigation Laws of the United States, 1919, pp. 66, 67.) No other limitations as to age are to be found in the statutes. It may be added that in actual practice apprenticeships are very rare and that this method of employing boys in the sea service is seldom resorted to. Boys are not shipped as apprentices but simply as boys, or, if they have the necessary physical qualifications, as ordinary seamen.

In order that the draft convention adopted in Washington prohibiting the employment of children under 14 years of age may be applied to the mercantile marine of this country it would be necessary for Congress to pass a law to that effect.

Item IV of the Agenda.

The Possibility of Establishing an International Code for Seamen.

THE Seamen's Act of the United States, being very much in the nature of a code, demonstrates the possibility of making an international code for seamen.

The requirements of the sea service make it necessary that more stringent disciplinary measures be applied to seamen at sea than to men in other classes of industry. A distinction should be made between the service of seamen while at sea and while in a safe harbor. In the former case suitable penalties should be provided to enforce obedience and the efficient performance of their duties by seamen, but while in a safe harbor seamen should be subject to only such civil liabilities as those to which other classes of workmen are subject. Payment of wages in advance before they are earned should in all cases be prohibited. The existing laws of the United States relating to seamen might be taken as the basis for an international seamen's code. Certain specific provisions could be modified to meet different conditions, but the fundamental principles of justice and fair dealing toward seamen contained in these laws should be retained as the foundation of an international seamen's code.

Price Fixing by the Government During the War.

By C. F. STODDARD.

THE "war powers" of the President of the United States, so frequently referred to as the source of and sanction for all acts of the Chief Executive not expressly granted by the Constitution, are not even referred to in that document, much less are they defined as to nature or delimited as to scope. These indefinite but very extensive powers which have been granted to every war President, and in almost unlimited degree to President Wilson, have arisen out of the necessity for a central executive power in time of national crisis. Justice Story, in his Commentaries on the Constitution, illustrates the wisdom of such a policy in the following language:

Of all the cases in the concerns of government, the direction of war most peculiarly demands those qualities which distinctly exercise the power by a single hand. Unity of plan, promptitude, activity, and decision are indispensable to success, and this can scarcely exist except where a single magistrate is intrusted exclusively with the power.

The very essence of administration is action and it is impossible for a legislative body to act promptly. Quite possibly the "war powers" might have been successfully invoked by the President, had he so desired, for the purpose of devising a complete system of price control and price fixing of "necessary" commodities. President Wilson, however, did not attempt to stretch the already much extended "war powers" over this field. He realized that ample authority to establish and pay fair prices for such material as the Government might need in an emergency had been conferred upon him by the provisions of the National Defense Act (approved June 3, 1916), which empowered him to commandeer manufacturing plants should war needs not be sufficiently met "at a reasonable price as determined by the Secretary of War." This provision of the National Defense Act is as follows:¹

The President, in time of war or when war is imminent, is empowered, through the head of any department of the Government, in addition to the present authorized methods of purchase or procurement, to place an order with any individual, firm, association, company, corporation, or organized manufacturing industry for such product or material as may be required, and which is of the nature and kind usually produced or capable of being produced by such individual, firm, company, association, corporation, or organized manufacturing industry.

Compliance with all such orders for products or material shall be obligatory on any individual, firm, association, company, corporation, or organized manufacturing industry or the responsible head or heads thereof and shall take precedence over all

¹ United States Statutes at Large, vol. 39, p. 213.

other orders and contracts theretofore placed with such individual, firm, company, association, corporation, or organized manufacturing industry, and any individual, firm, association, company, corporation, or organized manufacturing industry or the responsible head or heads thereof owning or operating any plant equipped for the manufacture of arms or ammunition, or parts of ammunition, or any necessary supplies or equipment for the Army, and any individual, firm, association, company, corporation, or organized manufacturing industry or the responsible head or heads thereof owning or operating any manufacturing plant, which, in the opinion of the Secretary of War shall be capable of being readily transformed into a plant for the manufacture of arms or ammunition, or parts thereof, or other necessary supplies or equipment, who shall refuse to give to the United States such preference in the matter of the execution of orders, or who shall refuse to manufacture the kind, quantity, or quality of arms or ammunition, or the parts thereof, or any necessary supplies or equipment, as ordered by the Secretary of War, or who shall refuse to furnish such arms, ammunition, or parts of ammunition, or other supplies or equipment, *at a reasonable price as determined by the Secretary of War*, then, and in either such case, the President through the head of any department of the Government, in addition to the present authorized methods of purchase or procurement herein provided for, is hereby authorized *to take immediate possession of any such plant or plants*, and through the Ordnance Department of the United States Army, to manufacture therein in time of war, or when war shall be imminent, such product or material as may be required. * * *

The compensation to be paid to any individual, firm, company, association, corporation, or organized manufacturing industry for its products or material, or as rental for use of any manufacturing plant while used by the United States, shall be fair and just.

It was not until the Food and Fuel Control Act² was approved (Aug. 10, 1917) that the President was specifically authorized to "fix" prices—the commodities wheat and coal and coke being named. This act also contained the following general provisions, the portions italicized particularly being interpreted as constituting authority to establish prices:

By reason of the existence of a state of war, it is essential to the national security and defense, for the successful prosecution of the war, and for the support and maintenance of the Army and Navy, *to assure an adequate supply and equitable distribution*, and to facilitate the movement of foods, feeds, fuel—including fuel oil and natural gas—and fertilizer and fertilizer ingredients, tools, utensils, implements, machinery, and equipment required for the actual production of foods, feeds, and fuel, hereafter in this act called necessities; *to prevent*, locally or generally, scarcity, monopolization, hoarding, *injurious speculation*, manipulations, and private controls, affecting such supply, distribution, and movement; and *to establish and maintain governmental control of such necessities* during the war. For such purposes the instrumentalities, means, methods, powers, authorities, duties, obligations, and prohibitions hereinafter set forth are created, established, conferred, and prescribed. *The President is authorized to make such regulations and to issue such orders as are essential effectively to carry out the provisions of this act.*

SEC. 2. In carrying out the purposes of this act the President is authorized to *enter into any voluntary arrangements or agreements*, to create and use any agency or agencies, to accept the services of any person without compensation, to cooperate with any agency

² United States Statutes at Large, vol. 40, p. 276.

or person, to utilize any department or agency of the Government, and to coordinate their activities so as to avoid any preventable loss or duplication of effort or funds.

SEC. 4. It is hereby made unlawful for any person willfully to destroy any necessities for the purpose of enhancing the price or restricting the supply thereof; * * * to engage in any discriminatory and unfair, or any deceptive or wasteful practice or device, or to make any unjust or unreasonable rate or charge in handling or dealing in or with any necessities; to conspire, combine, agree, or arrange with any other person * * * (d) to prevent, limit, or lessen the manufacture of the production of any necessities in order to enhance the price thereof, or (e) to exact excessive prices for any necessities * * *.

The President was also authorized, by this act, to license the importation, manufacture, storage, or distribution of any necessary and to prescribe regulations for the issuance of such licenses, the words of the provision being as follows:

SEC. 5. From time to time, whenever the President shall find it essential to license the importation, manufacture, storage, mining, or distribution of any necessities, in order to carry into effect any of the purposes of this act, and shall publicly so announce, no person shall, after a date fixed in the announcement, engage in or carry on any such business specified in the announcement of importation, manufacture, storage, mining, or distribution of any necessities as set forth in such announcement, unless he shall secure and hold a license issued pursuant to this section. The President is authorized to issue such licenses and prescribe regulations for the issuance of licenses and requirements for systems of accounts and auditing of accounts to be kept by licensees, submission of reports by them, with or without oath or affirmation, and the entry and inspection by the President's duly authorized agents of the places of business of licensees. Whenever the President shall find that any storage charge, commission, profit, or practice of any licensee is unjust or unreasonable, or discriminatory and unfair, or wasteful, and shall order such licensee, within a reasonable time fixed in the order, to discontinue the same, unless such order, which shall recite the facts found, is revoked or suspended, such licensee shall, within the time prescribed in the order, discontinue such unjust, unreasonable, discriminatory, and unfair storage charge, commission, profit, or practice. *The President may, in lieu of any such unjust, unreasonable, discriminatory, and unfair storage charge, commission, profit, or practice, find what is a just, reasonable, nondiscriminatory, and fair storage charge, commission, profit, or practice, and in any proceeding brought in any court such order of the President shall be prima facie evidence.*

This licensing provision proved to be a most effective weapon, for unless the prices fixed by the President through any properly authorized agency were adhered to by producers and dealers the licenses could be withdrawn and the offending parties restrained.

A broad interpretation of these provisions of law, together with the exercise of his "war powers," enabled the President to pursue a policy of price determination and regulation which in its effect was the same as though price fixing in its strictest interpretation had been authorized or exercised.

Throughout this article the term "price fixing" is used in a broad sense, including the regulation of prices directly or indirectly by any Government agency. Strictly speaking, the policy was one of price stabilization rather than price fixing.

Price fixing by the Government began in the middle of 1917. The primary purpose was to stimulate production, to insure rapid delivery of supplies, and to prevent extortionate prices, and consequently excessive profits. The stimulation of production was preeminently necessary, and to effect this the prices established were in many instances somewhat abnormal—higher than would otherwise have been the case. In most instances the prices fixed were those to be paid by the Government for by the Allied Governments, but in many cases, notably food and fuel, private enterprises and the public generally were directly benefited. These prices were, as a rule, determined and proclaimed as the result of agreement between the Government and producers and manufacturers, the latter submitting to an inevitable situation from patriotic motives and because of the legislative powers of the Government to commandeer industry if voluntary agreements should fail. As a rule, the price fixed was a maximum, although practically the maximum became the minimum. Metals and metal products furnished the widest field for price fixing, followed by textiles, building material, foods, farm products, drugs and chemicals, and fuel. Attention was first centered upon basic raw material, such as iron ore, copper, and lumber, then upon materials entering into munitions of war, such as sulphuric acid, zinc, and platinum, and finally upon articles needed for general consumption, such as coal, sugar, and flour.

Price-fixing Agencies.

THERE were many agencies which during the period of the war assumed the functions of price fixing. Some of these, for example, the Federal Trade Commission, the War Trade Board, the United States Shipping Board, and various sections of the Army and Navy Departments, established prices only under certain circumstances and on a limited number of commodities connected with their own particular interest, and for this reason their activities will not be considered in this article. With regard to the Army and Navy Departments, it should be emphasized that it was highly important to obtain material and supplies for war purposes, regardless of cost, and the prices determined were in many, perhaps most, instances considerably in excess of the prices that would have been established had there been an opportunity to study all the factors involved and really fix prices that could be regarded as fair to the Government.

The most important price-fixing agencies were the Food Administration, the Fuel Administration, and the War Industries Board, the latter functioning for the most part through its price-fixing committee which was established early in 1918 and which was affiliated with the board but answerable directly to the President.

The Food Administration was created by the President in August and the Fuel Administration in September of 1917, the former under the direction of Herbert Hoover and the latter headed by Dr. Harry A. Garfield, president of Williams College. Protection of the people was the first object of the Food and Fuel Administrations; they followed the commodities all the way from producer to consumer, fixing prices that the Government should pay and that would benefit the public as well.

The War Industries Board and later its price-fixing committee were concerned primarily with establishing prices to be paid by the United States—in short, with the protection of the Government. They did not extend their activities to include retailers, and in only a few instances were wholesalers included. The President, however, had suggested that prices charged by producers to the Government and to private industry should be uniform, and as a result the general public benefited.

Price Fixing by the Food Administration.

THE organization of the Food Administration was extensive and was developed as rapidly as possible after the appointment of Mr. Hoover as food administrator. On August 16, 1917, the President approved the appointment, for each State, of a Federal food administrator whose duty was to assist in the enforcement of the policies of the Food Administration in its efforts to stabilize conditions, to protect honest enterprises against illegitimate competition, and to correct the abnormalities and abuses that had crept into trade by reason of the world disturbance. These local administrators were in turn assisted by "price interpreting boards" in the principal centers of population, these boards consisting of representatives from wholesalers, retailers, and consumers. They were directed to determine fair margins of profit on retail sales and to publish in the local newspapers the prices resulting from their determinations. They were not legally empowered to fix retail prices but the effect was the same, for the prices published were regarded by the public and by retailers as maximum prices.

Fair-Price Committee.

It was definitely announced by the Food Administration that its aim would be to stabilize and not to fix prices, although, as already intimated, the latter was practically accomplished by the application of its power to license producers and large dealers. Although too late to have any effect upon the 1917 production of wheat, it became evident that it would be necessary to establish a fair price for the crop of that year. Accordingly the Food Administration, with the

approval of the President, appointed, on August 14, 1917, the so-called fair-price committee with the one purpose of determining what the Government should pay for the 1917 harvest. Dr. Harry A. Garfield, president of Williams College, afterwards Fuel Administrator, was appointed chairman of this committee, which was made up of representatives of the wheat-producing sections of the country and the consuming public.³

On August 30 a report was submitted to the President recommending a price of \$2.20 per bushel for No. 1 northern spring wheat at Chicago, and the President issued an order based on this determination establishing this as the basic price from which the prices of all other grades were to be determined applicable at each primary market in the country. Taking \$2.20 as the basic price, the prices of other grades at Chicago ranged from \$2.10 for No. 1 humpback to \$2.24 for No. 1 dark hard winter, No. 1 dark northern spring, and No. 1 amber durum. The prices of Nos. 2, 3, and 4 of each grade were fixed, respectively, at 3, 6, and 10 cents less than basic. The differentials between the different primary markets of the United States were as follows: Kansas City and Omaha, 5 cents less than the basic price; Duluth and Minneapolis, 3 cents less; St. Louis, 2 cents less; New Orleans and Galveston, basic; Buffalo, 5 cents more; Baltimore and Philadelphia, 9 cents more; and New York, 10 cents more than the basic price. These prices were later revised.

The following is the text of the committee's report. It indicates the procedure adopted and the reasons therefor, constituting a brief statement of the policy pursued in arriving at the determined price.

TO THE PRESIDENT OF THE UNITED STATES:

The undersigned committee has been asked by you to recommend the price which the Government should pay for the 1917 crop of wheat.

In its deliberations the committee has kept constantly in mind the three following factors:

First. The fact that the United States is at war.

Second. The need of encouraging the producer.

Third. The necessity of reducing the cost of living to the consumer.

The normal laws of supply and demand have been violently interfered with and Congress has undertaken to offset this disturbance by conferring extraordinary powers upon the President to stabilize prices. Each of the foregoing factors grows out of

³ The other members of the committee were: Charles J. Barrett (farmer), president of Farmers' Union, Union City, Ga.; William N. Doak, vice president and national legislative representative of Brotherhood of Railroad Trainmen at Washington. Roanoke, Va.; Eugene E. Funk (farmer and member of firm of Funk Bros. Seed Co.), president of National Corn Association, Bloomington, Ill.; Edwin F. Ladd (college president and professor of chemistry), president of North Dakota Agricultural College, Fargo, N. Dak.; R. Goodwin Rhett (banker and business man), president of Chamber of Commerce of the United States, Charleston, S. C.; J. W. Shorthill (farmer), secretary of National Council of Farmers' Cooperative Associations, York, Nebr.; James W. Sullivan, representative of American Federation of Labor at Washington, Brooklyn, N. Y.; L. J. Tabor (farmer), master of Ohio State Grange, Barnesville, Ohio; Frank W. Taussig (professor of economics), chairman of United States Tariff Commission, Cambridge, Mass.; Theodore N. Vail (capitalist), president of American Telephone & Telegraph Co., New York, N. Y.; Henry J. Waters (college president and professor of agricultural science), president of Kansas State Agricultural College, Manhattan, Kans.

conditions which have received the careful attention of the committee. Chief among them are: That the wheat yield in a great and important section of the country has this year been below the normal; that over against this situation is the crying need among the whole body of the population, especially the wage earners, that the rising tide of costs shall be stayed and reduced as rapidly as possible consistent with the welfare of the producer; that the Government is at the present time engaged in the great task of reducing and stabilizing cost of other staple commodities; that the wheat of the world is abundant for its needs, even disregarding the stores in Russia, but because of lack of shipping and war conditions the burden of supplying wheat to the Allies and to neutral nations rests for the time being upon the United States and Canada.

Your committee has also considered the fact that the Government price for the 1917 wheat crop is in effect a continuing guaranty until the minimum price guaranteed by Congress for the crop of 1918 goes into effect (July 1, 1918). It has considered the relation of the 1918 minimum-price guaranty to the price here recommended. It has also considered the effect which an early termination of the war would have upon the wheat markets of the world.

In reaching its conclusion the committee has been guided by the principles you have announced, that a fair price should be based upon the cost of production for the entire country, plus a reasonable profit. We have relied upon the cost estimates for the crop of 1917 furnished by the United States Department of Agriculture, checked by the results of our independent investigations and the evidence submitted to the committee by producers and their representatives.

The committee has considered the regulations recently established by the United States Food Administration Grain Corporation for the different grades of the wheat through which all transactions in wheat are to be standardized and speculation to be entirely eliminated. Also that profits to the grain dealer, miller, and flour dealer have been regulated and reduced by the Grain Corporation, effecting a material reduction in the cost of flour.

In consideration of the foregoing facts and circumstances, this committee respectfully recommends that the price on No. 1 northern spring wheat, or its equivalent, at Chicago be \$2.20 per bushel.

[Signed by the Committee.]

The Food and Fuel Control Act guaranteed a minimum price of \$2 for the 1918 crop. The price, however, was fixed by the President on February 21, 1918, at \$2.20, the same as had been established for the 1917 crop. On September 2, 1919, the President issued a proclamation naming \$2.26 as the minimum basic price for the 1919 harvest.

To facilitate wheat purchasing, selling, and accounting, and the taking over of the entire 1917 harvest, if necessary to maintain prices determined by the fair-price committee, the Food Administration Grain Corporation was formed with a capital of \$50,000,000. This was, on June 21, 1918, increased by the President to \$150,000,000, the purpose being (1) to enable the Food Administration to make the necessary readjustments in wheat prices at guaranty terminals to cover increases in railroad rates, and (2) in view of the large 1918 harvest to provide the Grain Corporation with the increased

capital necessary to carry out the Government's guaranty to the producers.

There appears to have been no scientific basis for the price fixed by the fair-price committee, no cost accounts were examined, and no statistical computations were made. The figure was reached "in consequence of an almost precipitous desire to increase the wheat supply and also to placate the farmers."

The Food Administration took the position that it had no legal authority to fix prices, so it adopted the method of voluntary agreement. The general policy pursued was to regulate prices, basing them on cost of production, as reported by producers, plus a stipulated margin of profit per unit of output—a margin which soon came to be interpreted as a minimum rather than a maximum. This may be illustrated by reference to the order fixing maximum profits of flour millers at 25 cents a barrel. This method has been criticized as not promoting efficiency of operation and as offering dishonest millers an opportunity and temptation to pad their reported costs, but it has been justified as "the simplest expedient of a rough and ready kind designed to meet the necessities of the situation," and "was perhaps the only method of regulation which offered a fair chance of success. Though surprisingly effective in the main, it led none the less to serious difficulties."⁴

By a campaign for food conservation carried into the homes of the land and by evidences of real effort to protect the public from excessive prices, the Food Administration succeeded in gaining the general approval of consumers and in so arousing public sentiment against the would-be profiteer in foodstuffs that the latter found himself in an unpopular position and was effectively restrained by the desire to retain the good will of his customers. Too much can not be said in support of the very great and effective power of public opinion in this connection, for it kept most private individuals from hoarding and prevented retailers from attempting to reap excessive profits quite as effectively as the fear that their licenses would be revoked.

Licensing.

As already noted, the most effective weapon conferred upon the Food Administration by the Food and Fuel Control Act was the power to require producers and large dealers to procure licenses and to observe certain detailed regulations made applicable to licensees. A severe penalty was provided for failure to comply. By this method maximum prices were established and maintained. The licensing plan was embodied in a presidential proclamation issued on October

⁴ "The wheat and flour trade under Food Administration control: 1917-18," by Wilfred Eldred. *The Quarterly Journal of Economics*, November, 1918, p. 40.

8, 1917, which set forth 20 commodities and their products,⁵ constituting the prime necessities of life, as subject to license.

Subsequently (Nov. 7, 1917) the President issued a proclamation, effective December 10, declaring it a military necessity to license the manufacture and the sale of bread, cake, crackers, biscuit, pastry, and other bakery products. Concerns using less than 10 barrels of flour and meal a month were excepted. Regulations issued under this proclamation forbade unnecessary profits, or charges which might be unjust, exorbitant, unreasonable, or unfair, and stipulated that manipulation by resales, especially if tending to higher prices, would be regarded as unfair.

The object of this licensing provision was to enlist the cooperation of all patriotic men in the various trades so as to eliminate speculation, hoarding, unreasonable profits, and wasteful practices in the great distribution system of the country. It was adopted to provide more effective machinery for the enforcement of the food law, and it unquestionably assisted in enabling the Food Administration to control prices.

Flour and Bread.

During the early summer of 1917 the Allies had been bidding against one another for flour and wheat in a market stripped of its surplus. A barrel of flour, made from wheat for which the farmer got \$7, was sold at \$15 and threatened to go higher. By fixing the basic price of wheat at \$2.20, by the limitation of profits to 25 cents a barrel, as already noted, by the licensing of bakers, etc., and by the establishment by the United States and the Allied Governments of a single purchasing agency, panic prices were made to drop, and with the assurance of a stable price the mills began to do business on a known margin. The immediate effect of these measures was a fall in the price of flour in two months to \$10.50 a barrel. This has been characterized as "an achievement of the first importance, and, whatever the offsets and inadequacies, is sufficient to justify the work of the Food Administration." Government control was exercised in turn over the margin allowed to the

⁵ This portion of the proclamation reads as follows:

It is essential in order to carry into effect the purposes of said act to license the importation, manufacture, storage, and distribution of necessities to the extent hereinafter specified.

All persons, firms, corporations, and associations engaged in the business either of (1) operating cold-storage warehouses (a cold-storage warehouse, for the purpose of this proclamation, being defined as any place artificially or mechanically cooled to or below a temperature of 45 degrees above zero Fahrenheit, in which food products are placed and held for thirty days or more); (2) operating elevators, warehouses or other places for storage of corn, oats, barley, beans, rice, cotton seed, cottonseed cake, cottonseed meal or peanut meal; or, (3) importing, manufacturing (including milling, mixing or packing), or distributing (including buying and selling) any of the following commodities: Wheat, wheat flour, rye, or rye flour; barley or barley flour; oats, oatmeal, or rolled oats; corn, corn grits, corn meal, hominy, corn flour, starch from corn, corn oil, corn sirup, or glucose; rice, rice flour; dried beans; pea seed or dried peas; cotton seed, cottonseed oil, cottonseed cake, or cottonseed meal; peanut oil or peanut meal; soya-bean oil, soya-bean meal, palm oil, or copra oil; oleomargarine, lard, lard substitutes, oleo oils, or cooking fats; milk, butter, or cheese; condensed, evaporated, or powdered milk; fresh, canned, or cured beef, pork, or mutton; poultry or eggs; fresh or frozen fish; fresh fruits or vegetables; canned; peas, dried beans, tomatoes, corn, salmon, or sardines; dried: prunes, apples, peaches, or raisins; sugar, sirups, or molasses.

millers, the jobbers, and the wholesaler. With a constant output of flour and a stable price the administration was able to approach the bread problem. Bakers were required to make only standard loaves weighing $\frac{3}{4}$, 1, $1\frac{1}{2}$, 2, and 4 pounds. They were also obliged to mix wheat middlings, rye, or some other approved ingredient with wheat flour in prescribed proportions. The application of all these provisions had the effect of fixing the price of bread at approximately 10 cents for a 16-ounce loaf.

Sugar.

The Food Administration's policy with regard to sugar was to fix a maximum price or margin by voluntary agreement with producers, thus applying its general policy as previously stated. Shortly after the organization of the Food Administration announcement was made, as the result of a conference with representatives of producers of about 85 per cent of the domestic beet output, that the producers had agreed to sell the 1917-18 crop of beet sugar at \$7.25 per 100 pounds, cane basis, at seaboard refining points. This agreement was later accepted by all the domestic beet sugar interests. The basic price was later increased.

During the latter half of September, 1917, the international sugar committee was formed to arrange for the purchase and distribution of all sugar either for the United States or the Allied Governments, and for the allotment of sugar to neutrals. The Food Administration succeeded in obtaining from representatives of the entire sugar-refining industry an agreement, to continue during the war, not only to obtain their supplies of raw sugar under the direction of the international sugar committee, but also to work on a stipulated margin between the cost of raw sugar and the selling price of refined sugar, thus limiting profits and going a long way toward stabilizing prices and eliminating speculation. They further agreed to refine sugar on a net margin between the cost of their raw material and the selling price of their refined product of approximately 1.3 cents per pound after deducting trade discounts.

Following conferences with Cuban producers over the price of Cuban raw sugar, an agreement was signed on December 24, 1917, fixing a price of \$4.60 per 100 pounds for the new Cuban crop which was then coming in; this amounted to about \$6 at New York. Just prior to this the Food Administration and the Louisiana producers had negotiated an agreement, signed October 23, fixing a price of \$6.35 per 100 pounds for raw sugar at New Orleans. These prices were subsequently increased.

The Western Sugar Refining Co. and the California-Hawaiian Sugar Refining Co., both located at San Francisco, notified the Food Administration that they would make the wholesale price for cane sugar in

the western half of the United States not to exceed \$7.25 per 100 pounds f. o. b. seaboard refining points.

During 1918 the sugar equalization board, incorporated with a capital of \$5,000,000, was organized by the Food Administration to "deal with facility in foreign sugar and thus give the Food Administration better control over both distribution and prices." "The object is to absorb the high peaks of cost in sugar production and to make small margin on the low cost of certain foreign sugars which may be purchased and thus secure an equalization of the price to the public on a lower level than will otherwise be possible." It was estimated that the public would benefit by upward of 1 cent a pound.

Thus the Food Administration exercised control over sugar and stabilized the retail price at from 9 to 10 cents per pound without actually fixing the price at any point from producer to consumer. By effecting agreements with producers the administration was in position to control the prices asked by refiners and subsequently by dealers by virtue of its authority to prevent "excessive prices for any necessities."

Price Fixing by the Fuel Administration.

THE Fuel Administration followed the policy of the Food Administration in appointing State administrators and local committees of citizens—these latter charged with the duty of ascertaining and reporting to the administrator the reasonable retail margin (that is, "the cost of the local distribution at a reasonable dealers' profit") to be allowed, which, when fixed by order, together with the cost at the mine named by the President, the transportation charges and the jobber's commission (when sold through a jobber), would constitute the price to the consumer. It was the purpose of the Fuel Administration to compile these figures with relation to local needs in order that it might, if necessary, apportion the supply of coal with careful regard to the greatest existing needs. Like the Food Administration the procedure of the Fuel Administration in establishing prices for fuel was based upon a plan involving consideration of cost of production plus a fair per cent of profit. The essential difference, however, was that the production costs used by the Fuel Administration were obtained from the Federal Trade Commission, and represented careful first-hand examination of cost accounts such as no other Government agency was empowered to make. The idea was to fix a price high enough to insure to the least favorably situated mine a margin of profit so that it would continue to produce coal.

Upon determination of fair prices for coal the President issued a proclamation effective for bituminous coal on August 21 and for anthracite coal on September 1, 1917.

The bituminous coal prices were based upon a division of the country into 29 districts, in each of which producers were required to market their output at the same price. It was provided that a jobber should not add to the purchase price a gross margin in excess of 15 cents per ton of 2,000 pounds. The maximum rate established for run-of-mine grade ranged from \$1.90 for Alabama big seam coal to \$3.25 for coal in the State of Washington, the average price being approximately \$2.36 per ton. To meet exceptional conditions in outlying fields prices ranging from \$2.15 to \$3.30 for run-of-mine coal were fixed.⁶

The maximum prices for anthracite were as follows:⁷

MAXIMUM PRICES FOR ANTHRACITE COAL PER TON OF 2,240 POUNDS, F. O. B. CARS
AT THE MINE.

Size.	White ash grade.	Red ash grade.	Lykens Valley grade.
Broken.....	\$4.55	\$4.75	\$5.00
Egg.....	4.45	4.65	4.90
Stove.....	4.70	4.90	5.30
Chestnut.....	4.80	4.90	5.30
Pea.....	4.00	4.10	4.35

¹ An order issued by the Fuel Administration, effective Oct. 1, 1917, reduced this price by 60 cents.

It was provided that a jobber dealing in anthracite should not add to his purchase price a gross margin in excess of 20 cents per ton of 2,240 pounds when delivery of such coal was to be effected at or east of Buffalo; 10 cents additional was allowed to be charged if delivery was to be made west of Buffalo.

Method of Fixing Maximum Gross Margins.

On September 30, 1917, the Fuel Administrator announced the method by which the retail coal and coke dealers should fix their maximum gross margins—that is, the difference between the average cost of coal and coke at the retailer's yard, wharf, or siding and the prices at which they are sold to the consumer. Under the plan announced the retailer was to ascertain his retail margin in the year 1915, when more normal conditions prevailed than in the fall of 1917. To this he could add not to exceed 30 per cent of that margin, including his profits at that time. It was provided, however, that in no case should the retail margin added by any retail dealer exceed the average added by him for the same size, grade, and class of business during July, 1917. The Fuel Administration defined the retail gross margin as being the difference between the price charged by retail coal or coke

⁶ These prices were increased by 45 cents a net ton on Oct. 17, 1917, as a result of the wage advance of Oct. 6. On May 25, 1918, the Fuel Administration reduced the prices 35 cents a ton.

⁷ Prices were advanced on Dec. 1, 1917, after the wage increase authorized by the President, by 35 cents a gross ton. There was a further advance on Nov. 1, 1918, of \$1.05 a gross ton, following another wage increase.

dealers to consumers and the average cost of coal or coke to such retailer, f. o. b. cars at his railroad siding, yard, pocket, or trestle, or free alongside his wharf, pocket, or water yard, or the average cost to such retailer at wholesalers' pockets, trestles, railroad sidings, mines, tipples, docks, yards, or wharves, as the case might be. It was directed that this average cost of coal or coke, to which the gross retail margin was to be added, should be ascertained by the dealer for each size and grade on the 1st and 16th of each calendar month, according to a method announced by the Fuel Administration, as follows:

The tonnage and average cost of coal or coke on hand at the beginning of a period is to be combined with the tonnage and average cost of coal or coke received during the period.

Example—Egg Coal.

	Tons.	Total cost.	Average cost per ton.
On hand Oct. 1.....	100	\$600.00	\$6.00
Received Oct. 1 to 15, inclusive.....	300	1,500.00	5.00
Total.....	400	2,100.00	5.25
Sold Oct. 1 to 15, inclusive.....	350		
On hand Oct. 16.....	50	262.50	5.25
Received Oct. 16 to 31, inclusive.....	300	1,425.00	4.75
Total.....	350	1,687.50	4.82

In the above example the average cost per ton of egg coal to which the gross margin should be added for sales during the period October 1 to October 15, inclusive, is \$6; during the period October 16 to 31, inclusive, it is \$5.25; and for sales during the period November 1 to 15, inclusive, the average cost is \$4.82. The same method of computation must be applied by each dealer in ascertaining his average cost of each size and grade of coal or coke.

In July, 1918, the Fuel Administration suggested the fixing of differentials in the prices of crude and of refined petroleum, and in August announced a plan to stabilize the price of crude oil. Coming so close to the end of the war, the effect of this upon prices was not apparent.

Price control by the Fuel Administration was effective. The various factors entering into the production and distribution of coal, such as labor, material, general expenses of operation, and transportation charges, increased very much during 1918, and as a result there were substantial advances to the consumer. The greatest advances, however, occurred after the signing of the armistice, when the restraining influence of the Fuel Administration was considerably modified. Changes in prices to the consumer are shown in the following table, which gives for the United States the average and relative prices, per ton of 2,000 pounds, of bituminous coal and of two grades of anthracite coal in specified months, 1916 to 1920.⁸

⁸ For more complete data on coal prices see MONTHLY LABOR REVIEW for March, 1920, p. 63.

AVERAGE AND RELATIVE PRICES, PER TON OF 2,000 POUNDS, OF COAL FOR THE UNITED STATES IN SPECIFIED MONTHS, 1916 TO 1920.

[1913=100.]

Year and month.	Pennsylvania anthracite, white ash.				Bituminous.	
	Stove.		Chestnut.		Average price.	Relative price.
	Average price.	Relative price.	Average price.	Relative price.		
1913: Average for year.....	\$7.73	100	\$7.91	100	\$5.43	100
1916:						
January.....	7.93	103	8.13	103	5.69	105
July.....	8.12	105	8.28	105	5.52	102
1917: January.....	9.29	120	9.40	119	6.96	128
1918:						
January.....	9.88	128	10.03	127	7.68	141
July.....	9.96	129	10.07	127	7.92	146
1919:						
January.....	11.51	149	11.61	147	7.90	145

1920: January.....	12.59	163	12.77	161	8.81	162

The extent to which price manipulation might have gone had the Fuel Administration not interfered and fixed what it considered a fair price can only be surmised.

War Industries Board and its Price-Fixing Committee.

THE first agency of any importance in the price-fixing field, after the United States entered the World War, was the War Industries Board, which functioned in this respect largely through its price-fixing committee. Prior to the creation of this board a limited amount of price fixing had been practiced, notably the fixing of prices for lumber by the Council of National Defense as the result of an agreement on June 18, 1917, and the establishment of coal prices for the Navy on June 19, 1917.

The War Industries Board was created by the Council of National Defense, with the approval of the President, on July 28, 1917. Among other things, this board was to give "advice to the several purchasing agencies of the Government with regard to the prices to be paid." The need for such a board was soon apparent. In the autumn of 1917 it was recognized that the country was facing a serious economic situation, due to the inflation of prices of various articles in which a shortage had arisen through the abnormal demands made necessary by the prosecution of the war. The situation was not peculiar to the United States. It had confronted various other nations and had been dealt with through a system of price regulation. The War Industries Board undertook to fix maximum prices of fundamental commodities for the Government, the Allies, and private enterprises. The volume of work required of this board prompted

the President, on May 28, 1918, to separate it from the Council of National Defense and to clothe it with the authority of a separate executive agency. It was stipulated that in the determination of the prices the chairman of the board should be governed by the advice of a price-fixing committee, consisting, besides himself, of the members of the board immediately charged with the study of raw materials and of manufactured products, of the labor member of the board, of the chairman of the Federal Trade Commission, the chairman of the Tariff Commission, the Fuel Administrator, and a representative each of the Army and of the Navy.⁹ The price-fixing committee had no legislative authority to fix prices, but it acted as the personal representative of the President, exercising such prestige or authority as he might have as President of the United States and commander in chief of the Army and Navy. This authority was quite as effective in dealing with the industries as any act of Congress would have been.

In order intelligently to fix prices the committee endeavored to have before it—

1. The history of the industry under consideration for a period of years before the war;
2. Statistics of the capital invested and its relation to turnover or sales;
3. Sales and profits realized;
4. The cost of production;
5. A statement or balance sheet segregating the costs of the most and least efficient producers of each commodity during the year 1917; and
6. As much more recent information regarding cost and prevailing market prices as could be had up to the time prices are to be fixed.

The machinery for furnishing this information was found in the Federal Trade Commission, which through its chairman as member became closely affiliated with the price-fixing committee. The procedure, in brief, was as follows:

After a careful study of the data secured from the Federal Trade Commission the committee called into consultation the representative members of the industry involved, and endeavored by mutual agreement to determine upon maximum prices which would be fair to all concerned. The prices which were fixed for the public were what were known as primary prices at which the manufacturer or producer usually sells and did not follow the commodity into retail distribution. It was the custom to fix prices for a period of 90 days only, as the conditions involving costs were more or less subject to constant change.

⁹ The personnel of this committee was as follows: Robert S. Brookings, chairman; B. M. Baruch, chairman, War Industries Board, ex officio; W. B. Colver, chairman, United States Federal Trade Commission; F. W. Taussig, chairman, United States Tariff Commission; H. C. Stuart, chairman of the Agricultural Advisory Committee; Hugh Frayne, Labor Division, War Industries Board; H. A. Garfield, Fuel Administrator; R. H. Montgomery, United States Army; Commander John M. Hancock, United States Navy.

The rule was to fix a uniform price to be paid by all departments of the Government, as well as by our Allies, and primary prices to be paid by the public, after which the numerous sections of the War Industries Board took up with the industry the question of the allocation of orders to the end that our war needs should have preference, but the committee at the same time endeavored to secure a supply for our most urgent domestic needs.

As production during the war was of first importance, it was the policy in fixing prices to avoid fixing them so low as to eliminate the high-cost producer. This naturally gave the largest and lowest cost producer a somewhat larger profit at times than would have otherwise been permitted, but it was felt by the majority of the committee that in such cases the excess-profit tax would practically absorb the difference. An illustration in point is that of copper where a price of 23½ cents a pound was determined upon, whereas it was known at the time that several large companies had agreed to furnish the Government with copper at 16¾ cents a pound. If there had been no price fixing of any commodity it is probable that the prices at which the largest, and therefore low-cost, producer could sell his commodity would have governed the market, forcing out of business many of the high-cost producers whose production was essential and materially affecting the excess-profit tax returns. It should be emphasized that it was the output of the "bulk line" or marginal producer—that is, the one producing a required commodity in an amount most nearly equivalent to the total needs of the Government and of private industry, as ascertained—that was so badly needed, and the price fixed had to approximate his production cost plus a fair profit. To obtain a maximum output prices had to be high enough to insure the production of a supply sufficient for all urgent needs. Briefly the policy pursued was that of cooperative voluntary price fixing made effective by the impulse of patriotism and by the Government's exercise of certain forms of duress such as fuel discrimination, priorities, licenses, and, if necessary, the commandeering of industries. Price fixing under this form of compulsion was deemed justifiable in order to stabilize industry, to bring out maximum production, to eliminate profiteering, and to effect absolute control of all essential commodities during the war. The method adopted was most effective, and the comparatively low prices which resulted, in face of unprecedented demand both by our own Government and by the Allied Governments, would seem to justify the course. As Prof. Taussig has said,¹⁰ "Soaring prices, speculative advances, manipulation by middlemen, a runaway market—these were the conditions impending and which price fixing was primarily designed to remedy."

¹⁰ "Price fixing as seen by a price fixer," by F. W. Taussig. *The Quarterly Journal of Economics*, February, 1919, p. 213.

Iron and Steel.

While yet a part of the Council of National Defense the War Industries Board was called upon to determine prices that the Government should pay for many essential commodities. Important among these were iron and steel, the initial prices for which were fixed in September, 1917. The control exercised by the Government over iron and steel prices had a very important influence on the course of the market. The following account of price fixing in iron and steel taken from War Industries Board Price Bulletin No. 33 (pp. 19-21) gives an insight into the method adopted for this industry, and at once suggests general considerations that guided the board in its price-fixing policy:

For several months before the policy of price fixing was entered upon, there were discussions and disagreements concerning what prices the Government ought to pay for steel. A controversy arose between the chairman of the United States Shipping Board and the manager of the Emergency Fleet Corporation over the prices to be paid by the Government for structural shapes and steel plates. The manager of the Emergency Fleet Corporation announced on June 16, 1917, that he had agreed "provisionally" upon a price of 3.75 cents per pound for shapes and 4.25 cents per pound for plates, "with the understanding that the committee on raw materials of the advisory commission of the Council of National Defense would later go into the question of costs and determine an equitable return to the steel men." The chairman of the Shipping Board declared that these provisional prices were \$30 a ton higher than prices being paid by the Navy Department for the same material, and that he would sign no contracts at those figures. The steel makers then agreed, pending the final determination of prices, to furnish steel plates at the tentative price of 2½ cents a pound.

The chairman of the Shipping Board joined with the Secretary of the Navy in requesting the Federal Trade Commission to begin an inquiry for the purpose of ascertaining the costs of production, these costs to be used as a basis for determining the prices to be paid by the Government. A similar investigation was being conducted by the Senate Committee on Interstate Commerce as part of an inquiry into the prices at which materials of all kinds should be sold to the railroads. The steel committee of the Council of National Defense had taken up the question of steel prices and was working independently of the other inquiries.

On July 12 a conference was held between the representatives of the iron and steel producers and Government officials, which was regarded as preliminary to fixing prices for Government needs. On September 24, the President approved an agreement between the War Industries Board and the steel men fixing maximum prices on ore, coke, pig iron, steel bars, shapes, and plates, which became effective immediately and were subject to revision January 1, 1918. The price of ore was not reduced; the price of basic pig iron was cut from \$48 per ton to \$33 per ton; the price of steel plates was reduced from 8 cents per pound to 3.25 cents per pound. Other products came under control in the succeeding months, the American Iron and Steel Institute actively cooperating with the Government in the establishment of differentials and in maintaining a due proportion among the prices as they were scaled down.

As part of the policy of price fixing, safeguards were provided against certain commonly predicted evil consequences that were to follow regulation. Fears had been expressed that production would not be maintained when prices were reduced; that producers would protect their profits by reducing wages and so cause labor

unrest; and that charges of unjust discrimination would be made by the public and the Allies if the Government bought steel at less than the prices they were paying. As part of the agreement, therefore, the producers pledged themselves to maintain production; not to reduce wages; and to sell to the Government, the public, and the Allies at the same prices.

The character of the market situation immediately preceding price fixing must be borne in mind in considering the effectiveness of price regulation of iron and steel. The quantity of steel available in the market was small, mill capacity had been sold up for months ahead, and market prices reflected the scramble to secure the unpledged output. These prices charged to the late comers bore no relation to cost of production. Current deliveries on long-time contracts were at prices much less than those in the open market, though large premiums were paid for prompt shipments. The Government was unable to buy at uniform prices, but was letting contracts at the same time for the same material at different figures. The situation had become intolerable; as a satisfactory means of determining prices the uncontrolled market had failed.

The effectiveness of price fixing in remedying some of these evils can not be questioned. Confronted with the situation as it existed in the middle of 1917, price fixing was a wiser expedient than any of the suggested alternatives. It was more direct and more economical than paying the market price and trusting to the excess-profits tax to bring back to the Treasury the extraordinary profits. It was simpler as a matter of administration, and in closer accord with the general policy of the Government than the commandeering of the steel plants. The policy succeeded in bringing about substantial reductions, in giving uniformity to prices, and in stabilizing the market. The control was so effective that in looking back upon the experience the only regret is that the control was not exercised at an earlier date.

On September 24, 1917, maximum prices were announced by the War Industries Board, namely, \$5.05 per gross ton for iron ore (lower lake ports), \$33 per gross ton for pig iron, \$2.90 per 100 pounds for steel bars, and \$3.25 per 100 pounds for plates. With this announcement the market became stabilized at a level lower than that prevailing before the entry of the United States into the war.

Copper.

Copper was another very important commodity demanded by the Government on which the War Industries Board fixed prices. Copper was a metal of prime necessity to the nations at war. In December, 1915, the average price of copper per pound was 20.35 cents; in February, 1916, it was 27.35 cents and did not react below this figure until July, 1917, when the average was 24½ cents. In December, 1916, the average price was 33.84 cents, and this in spite of increase in output. The average price for the first nine months of 1917 was 28.4 cents. On September 21, 1917, the War Industries Board fixed the price of copper to the Government at 23½ cents f. o. b. New York, and this was increased to 26 cents in July, 1918. The price fixed was a compromise, since 25 cents was the lowest price at which producers were willing to sell, and the Government's offer was only 18 cents. The procedure adopted in fixing the price of

copper illustrates the method followed by the War Industries Board and later by its price-fixing committee in fixing prices for a long list of commodities.

First the quantity needed directly for war purposes and for essential industries was ascertained. From schedules of the Federal Trade Commission such data as necessary were obtained as to amount of production and the production cost, the latter being distributed into amounts spent for labor, material, other supplies, and for general expenses. A list of copper-producing companies was then made up, beginning with the company reporting the highest production cost on a pound basis and continuing to the lowest. The production cost of the "bulk line" producer or marginal producer was then taken as the basis for a fair price to be fixed for all copper needed. "As a rule a price was fixed that would 'protect' four-fifths or nine-tenths of the entire output." This was not an inflexible rule, but was quite generally followed.

The first price fixed by the committee (Sept. 21, 1917) was 23½ cents. Thus, companies whose production cost was less than this amount would receive considerably more than what was considered a fair price for their copper, while those companies whose production cost was over 23½ cents would not receive sufficient to make expenses. However, their embarrassment was relieved by the fact that their product was bought by nonessential industries whose requirements had not been considered in fixing the price and who could not therefore purchase copper at the price fixed.

Textiles and Clothing.

Although some articles (18 series) in the cloths and clothing group, notably certain kinds of woolen, cotton, and leather goods, were subject to price control by the War Industries Board, beginning in May, 1918, the effect was not a stabilization of prices of clothing to the consumer. On the contrary, price control was ineffective in this respect. In the group as a whole, the wholesale price index number, as computed by the Bureau of Labor Statistics, rose continuously from May, 1917, to July, 1918, being 173 in the former month and 249 in the latter month, based on the year 1913 as 100. With apparently no prospect of relief in the price of clothing, which during 1917 and 1918 showed a greater advance than any other item of the average family budget, Dr. Royal Meeker, Commissioner of Labor Statistics, was prompted to direct a letter to the President on August 29, 1918, urging him to appoint a textile and clothing administrator in order that some restraining influence in the interest

of the public generally might be brought to bear upon those responsible for the high prices. Dr. Meeker's letter was as follows:

MY DEAR MR. PRESIDENT: I beg leave to suggest that you appoint immediately a textile and clothing administrator to bring about regulation and control of the prices and qualities of textiles and clothing in the same way as the food administrator has regulated and controlled the qualities and prices of foodstuffs. The benefits to the people from the activities of the Food Administration are statistically demonstrable, and the need for a similar policy of regulation and control of textiles and clothing is likewise demonstrable by the statistical method.

The Food Administration began its activities in May, 1917. For your information I inclose a tabular statement showing variations in prices of food and clothing at wholesale and variations in prices of food at retail. The index numbers are calculated on the basis that 1913 equals 100.

Unfortunately, we have no strictly comparable figures showing variations in prices of clothing at retail for the whole country. We do know the changes in prices of clothing in the shipbuilding centers in which we have made cost-of-living studies. The percentage price changes in these cities were computed on the basis that 1914 equals 100 because it was impossible to get dependable price data as far back as 1913.

You will note that the wholesale food index in May, 1917, was 191, while in July, 1918, it was 185, being a *decrease* of more than 3 per cent since May, 1917. On the other hand, the wholesale cloths and clothing index in May, 1917, was 173, while in July, 1918, it was 249, being an *increase* of more than 44 per cent. Surely there is a reason. No one would have the temerity to say that a scarcity exists any more in textiles than in food. Neither has the demand for clothing increased to a greater extent than the demand for foodstuffs. The difference between the decrease of more than 3 per cent in average prices at wholesale of foodstuffs and the increase of more than 44 per cent in the average prices at wholesale of clothing represents the difference between *public* control of prices in the interests of the people and *private* control of prices for the benefit of the private price controllers.

Quite naturally the Food Administration has been able to control wholesale prices much more effectively than retail prices. You will note that the retail food index for May, 1917, was 151 and that there has been a pretty consistent increase in retail food prices from that date to July, 1918, when the retail food index reached 167, showing a percentage increase of more than 10 per cent.

The increase in cost of food in the families studied in our cost-of-living investigation is less than that shown in our retail-food price index, although it is not possible to compare family expenditures in May, 1917, with July, 1918. We are now tabulating the retail prices for August, 1918, of the different items consumed by workingmen's families, as found in the shipbuilding centers included in our budget study. The figures thus far obtained are from southern cities only and show that clothing has increased in price since 1914 by from 91½ per cent to 127 per cent. Furniture and furnishings purchased by workingmen show an increase in these same cities of from 104 to 131 per cent. Expenditures for clothing constituted from 11 to 14 per cent of the total family budget in southern cities and from 15 to 16 per cent of the total family budget in northern cities. Food is, of course, a much more important item, ranging from 45 to 54 per cent of the total family expenditures in southern cities and from 40 to 45 per cent in northern cities. Next in importance to expenditures for food, however, come expenditures for clothing, and prices of clothing have increased already to an alarming extent. Dry-goods merchants are frightening people to death and inducing them to purchase much more clothing than they have any earthly need for by telling them that the prices of the new stocks of clothing are to be much higher than they now are.

I sincerely trust that you will seriously consider my suggestion and at once take steps to transfer the regulation and control of clothing consumption and prices from the hands of private individuals intent on acquiring profits to the hands of a competent public administrator charged with the duty and vested with the authority to see to it that the people obtain standard goods at reasonable prices.

Sincerely yours,

ROYAL MEEKER,
Commissioner of Labor Statistics.

EXHIBIT.

The President replied that he did not believe he had the authority to take the same action in regard to textiles and clothing as he had taken with respect to food and fuel.

Results of the Policy of Price Fixing.

WHATEVER the individual results of the Government's price-fixing policy, it may be said that the Government did succeed in a large measure in preventing extortionate prices for materials needed for war purposes and for other commodities, including primarily food and fuel, essential to the existence of the 105,000,000 people whose cooperation made such a result possible. The achievement of the Food Administration, especially in its efforts to control wheat and its products and to prevent speculative prices by inducing the millers to enter into an agreement not to pay for wheat a price in excess of the fair price established by the Food Administration, presents one of the most important and interesting chapters in the history of price control.

The same, in a more restricted sense because fewer commodities were dealt with, may be said of the Fuel Administration. Next to food, fuel was the most important article subject to control. Without it war industries could not operate. The control of manufactured articles, and, to a degree, of raw material, depended upon supplies of coal and fuel oil. With increased production and an unprecedented demand, prices were bound to rise and not only affect industry but the public as well. To prevent manipulation and speculative advances in this emergency a policy of price adjustment was absolutely necessary and the Fuel Administration, specifically clothed with this authority, acted with promptness and fixed prices which were based on a careful inquiry into the cost of production. In the opinion of some the prices were fixed unnecessarily high. It is believed that an equal or even greater supply than was secured would have been obtained had prices been fixed sufficiently high to encourage production by the more economically situated mines instead of so high as to stimulate the opening of new mines, the reopening of abandoned mines, and the development of uneconomical mines at a large capital outlay.

Some criticism, even among those directly connected with the War Industries Board and its price-fixing committee, was aimed at the policy of the board in fixing prices on the basis of cost of production for the bulk line or marginal producer rather than by the system of pooling, by which low-cost and high-cost producers alike should receive prices in proportion to their several costs, the Government to charge itself with the average cost and, so far as civilians were to be supplied, to charge them the same price. To quote from Prof. Taussig:¹¹

This proposal [pooling] rested mainly on an unwillingness to permit the low-cost producers to secure high gains. Any price paid uniformly to all producers necessarily meant differences in profits. When that uniform price was fixed on the basis of the marginal or bulk line producer, the profits of those favorably placed were not only great, but greater than they would have been under normal conditions. In the essential industries, such as steel and copper, the necessities of the situation called for the maintenance of high cost and inefficient producers whose position under no ordinary circumstances would be dominant. True, it was urged that the high gains for the fortunate producers were likely to be reached by the excess profits tax. But it was also urged that no such tax could be a complete offset, and that it would be wise to proceed at once upon a pooling basis; let the Government's buying price be cost for each several producer, and average cost, not marginal cost, be the basis of any sales made to the public. The Government as well as the public would secure the goods at lower prices.

Justification for the method actually pursued was found in the necessity of stimulating and maintaining output. Great quantities of material were needed by the Government and it seemed absolutely necessary to adopt some method that would encourage the marginal

¹¹ "Price fixing as seen by a price fixer," by F. W. Taussig. *The Quarterly Journal of Economics*, February, 1919, p. 232.

producer whose output was essential. He at all events had to be maintained. A price had to be paid that would induce him to continue in operation.

The merits of the two methods will not be discussed. The first one was adopted and the results seemed to be quite satisfactory. Most of the prices fixed, as already stated, were in reality agreed prices reached in cooperation with the producers concerned. In some instances there were decreed prices which the producers were bound to accept, knowing that the committee could enforce them by a somewhat veiled threat of commandeering and that public sentiment would condemn as unpatriotic those who refused to accept the prices named.

Did Price Fixing Stimulate Production?

One of the objects of price fixing was the stimulation of production. Did it accomplish this end? The War Industries Board Price Bulletin No. 1 (pp. 44-46) gives data intended to show that the result was generally quite satisfactory in this respect. An index number of changes in the physical volume of production is presented for 90 raw materials, including substantially all the staples, computed at 1917 prices. To make sure that the comparison between increase in the production of raw materials and the increase of prices is fair, an index number of prices was made from these same materials, fabricating factors and all. Here, of course, the prices were the variables, and they were weighted each year by the supply forthcoming in 1917. Finally, a third index was made by multiplying the supply of each commodity each year by its average annual price. From the aggregate values thus obtained relatives were computed with the figures for 1913 as the base, since production data for the year ending June 30, 1914, were not available. The result is as follows:

INDEX NUMBERS OF THE PRODUCTION OF RAW MATERIALS, OF THE PRICES OF RAW MATERIALS, AND OF THE ANNUAL VALUE OF RAW MATERIALS PRODUCED, BY YEARS, 1913 TO 1918.

Year.	Yearly production×1917 prices.	Yearly prices×1917 production.	Yearly prices×yearly production.
1913.....	100	100	100
1914.....	99	96	96
1915.....	107	99	106
1916.....	111	117	131
1917.....	114	174	200
1918.....	116	192	225

The general effect of price control by the Government may be best illustrated by the following table, which shows index numbers of 573 commodities brought under formal or informal control at some time during the war compared with those of 793 commodities

whose prices were left uncontrolled. It is unfortunate that a similar showing can not yet be made for specified articles in each group, as this would reflect more accurately the influence of control on prices.

WAR INDUSTRIES BOARD INDEX NUMBERS OF CONTROLLED AND UNCONTROLLED PRICES, 1913 TO 1918.

[Average prices, July, 1913, to June, 1914=100.]

It will be seen that the commodities ultimately brought under Government price control had risen more than the uncontrolled list by the time the United States severed diplomatic relations with Germany. The index numbers for the two classes in February, 1917, were 155 and 142, respectively. Further, the commodities afterwards controlled were very much more affected by the declaration of war than the others; they rose about 35 per cent in price between February and July, while the uncontrolled commodities rose nearly 13 per cent. Control was applied, then, to prices which as a group were very high before the Government's economic program was developed. That fact doubtless facilitated the effort to prevent a further advance or even to reduce prices.

Broadly speaking, the effect of price control was to bring down the index number of controlled commodities within the year from 209 (July, 1917) to 189 (June, 1918). After June, 1918, however, the controlled commodities began to rise again, often with the full concurrence of the price-fixing authorities. For at their successive reconsiderations of the prices of given commodities these authorities frequently conceded the necessity for raising their previous maximum prices to offset increased costs of production. Uncontrolled commodities, on the other hand, rose in price steadily month by month

after July, 1917, while the controlled commodities were zigzagging downward. With the first relaxation of the Government control the controlled commodities advanced in price, while the uncontrolled commodities declined.

Those responsible for price fixing never formulated fully the principles underlying their action, and it may be doubted if they were guided by any single principle. The attention given to costs of production in their investigation and conferences, however, indicates the point of view from which they worked and some of the determining considerations. The theory of price fixing implied in their regulations was that the principles of a competitive market should be applied to a market situation in which those principles no longer prevailed. The faith that an uncontrolled market will give "fair prices" rests on the belief that competition will keep prices in a close relation to costs of production. When the conditions of demand are such as to destroy this relation between prices and costs, as they were during the war, unfair prices and unreasonable profits result. It was a matter of keeping the faith, therefore, to apply to prices through price-fixing agencies the same principles which the market would have worked out under normal conditions.¹²

Almost immediately upon the signing of the armistice price control and price fixing were terminated, though agreements were, as a rule, carried out to the end of the period for which made. The War Industries Board was dissolved on January 1, 1919. The Food and Fuel Administrations, though created for the duration of the war, practically suspended operations early in 1919.

¹² War Industries Board Price Bulletin No. 33, p. 21. Washington, 1919.

INDUSTRIAL RELATIONS.

New System of Wage Adjustment for Railways.

THE MONTHLY LABOR REVIEW for April carried an account (pp. 50-57) of the provisions of the new railroad control act with regard to a board for the adjustment of industrial relations in the service. Three members of the board are to represent "the employees and subordinate officials of the carriers," and constitute "the labor group;" three are to constitute "the management group, representing the carriers;" and three, "the public group, representing the public." All are to be appointed by the President, subject to confirmation by the Senate. The last named are to be appointed directly, and the others from nominees submitted by the respective groups. Six names are to be proposed by each group, the nominations to be made and offered in such manner as may be prescribed by the Interstate Commerce Commission, which is also to take steps to determine who shall be classed as "subordinate officials."

The act was approved February 28, and authorized the President to act without nominations in case such were not submitted within 30 days after the passage of the act. This limitation required promptness of action by the Interstate Commerce Commission in formulating regulations, and on March 8 the main draft was promulgated.

The act makes no reference to unions, but the commission accepted the representations of those who were "in a position to speak with confidence and authority" that "the overwhelming majority" of the workers—said to be more than 90 per cent of the employees and subordinate officials—are members of certain organizations, or are represented through them, and agreed to accept their nominations. Inasmuch as but three representatives could be appointed it was decided to group the organizations so as to permit the nomination of representatives of the different classes of employees as far as possible. For this purpose the following groups were made:

Group 1:

- Brotherhood of Locomotive Engineers.
- Brotherhood of Locomotive Firemen and Enginemen.
- Order of Railway Conductors.
- Brotherhood of Railroad Trainmen.
- Switchmen's Union of North America.

Group 2:

International Association of Machinists.

International Brotherhood of Boilermakers, Iron Ship Builders and Helpers of America.

International Brotherhood of Blacksmiths, Drop Forgers, and Helpers.

Amalgamated Sheet Metal Workers' International Alliance.

Brotherhood Railway Carmen of America.

International Brotherhood of Electrical Workers.

Group 3:

Order of Railroad Telegraphers.

United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers.

Brotherhood of Railway Signalmen of America.

Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees.

International Brotherhood of Stationary Firemen and Oilers.

The accredited representatives of each group were asked to act and agree among themselves as to nominees representative of the group, the three groups not to offer more than six nominees. Nominations, properly signed and accompanied by a certificate that they had been made in accordance with the regulations, were to be transmitted directly to the President.

As to the management group, it was found that the Association of Railway Executives is representative of approximately 95 per cent of the railroad mileage of the country, and is therefore in a position to speak for the carriers in making the desired nominations. These nominations are likewise forwarded directly to the President, with proper authentication.

Who were to be classed as "subordinate officials" was to be determined after notice and hearings of the parties interested, but as the shortness of time made such determination impracticable, and as there was no doubt as to the status and rights of employees, it was thought best not to make a classification of "subordinate officials" lest it might subsequently be found to be unsatisfactory; accordingly the regulations issued March 8 made no provision for their representation. On March 15, however, a public hearing was held for the purpose of determining upon the classes to be included as "subordinate officials," as the term is used in the act. It was decided to include claim agents who must report to a superior before a final decision on claims is reached; engineers of mechanics, including civil engineers inferior in rank to engineers of maintenance of way; foremen not vested with authority to employ, discipline, or dismiss subordinates; supervisors of signals; yardmasters without authority to employ, discipline, or dismiss, but not including those in large and important centers, where such power is vested in the yardmaster; train dispatchers, and storekeepers, whose powers are limited as set forth in regard to foremen and yardmasters. This included all

classes represented at the hearing except traveling auditors and supervisory station agents whose rank and duties were felt to class them more properly as representatives of the companies than as "subordinate officials." The power of revision of the list on due hearing, and as occasion warrants, was expressly reserved.

Also, supplemental regulations setting forth the relation between employees and subordinate officials in the matter of making nominations, were issued on March 23. It was concluded that both classes of persons were entitled to make and offer nominations, even though "the great mass of the railroad employees and subordinate officials are members of or represented through the organizations named" in the original regulation.

Claims to participate in making the nominations were submitted in behalf of certain organizations not included in the groups enumerated in the regulations of March 8. A fourth group was therefore made, including these organizations of employees and also organizations of subordinate officials admitted to make nominations. This group is as follows:

Group 4:

- Railway Men's International Benevolent Industrial Association.
- American Federation of Railroad Workers.
- Order of Railroad Station Agents.
- American Train Dispatchers Association.
- The Roadmasters and Supervisors Association of America.
- National Order of Railroad Claim Men.
- Railroad Yardmasters of America.
- International Association of Railroad Supervisors of Mechanics.
- International Association of Railroad Storekeepers.
- Colored Association of Railway Employees.
- Brotherhood of Railroad Station Employees.
- Order of Railroad Telegraphers, Dispatchers, Agents, and Signalmen.
- Brotherhood of Railway Clerks.
- American Association of Engineers.
- Grand United Order of Locomotive Firemen of America.
- Porters' Union.
- Skilled and Unskilled Laborers (Railway).
- Order of Railway Expressmen.

These organizations were authorized to act through their accredited representatives in making nominations that would represent single organizations, or be jointly representative of two or more, as might be agreed upon. In transmitting these nominations, statements were to be furnished showing the total membership of the organizations taking action, distinguishing between officials excluded by the regulations and subordinate officials permitted to act; also between the latter and employees proper. The percentage of the membership belonging also to any of the organizations named in the regulations of March 8 was to be stated.

The Board Appointed.

NOMINATIONS were submitted in accordance with the methods prescribed by the act and the regulations of the commission, and a list of names was sent to the Senate by the President on April 13, 1920. The delay in forwarding the list was said to be due to the difficulty in securing suitable persons who met the terms of the law. Active membership in a union or pecuniary interest in railroads operates to bar one from eligibility, though the retention of an honorary membership and insurance or other benefit rights does not so operate.

The persons named were: For the labor group, Mr. Albert Phillips, of Ohio, vice president of the Brotherhood of Locomotive Firemen and Enginemen, of Group 1, A. O. Wharton, of Missouri, of the Railway Employees' Department of the American Federation of Labor, and Mr. James J. Forrester, of Ohio, president of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, of Group 3; for the management group, Mr. Horace Baker, of Ohio, formerly general manager of the Cincinnati, New Orleans & Texas Pacific Railroad, Mr. J. H. Elliott, of Texas, formerly general manager of the Texas & Pacific Railway Co., and William L. Park, of Illinois, vice president of the Chicago Great Western Railroad Co.; for the public group, Mr. R. M. Barton, of Tennessee, for a number of years a member of the Tennessee court of appeals, Mr. G. Wallace W. Hanger, of the District of Columbia, formerly chief clerk of what is now the United States Bureau of Labor Statistics, and since 1913 assistant commissioner of the United States Board of Mediation and Conciliation, and Mr. Henry Hunt, of Ohio, formerly mayor of Cincinnati.

The Senate confirmed these nominations on April 15, and the board held its first meeting on the following day.

Wage Movement of Organized Railway Employees, 1919-20.

DETAILS of the movement among organized railway employees for increases in their rates of pay are given in various reports¹ published by the chief executives of the railroad organizations, much of this information being contained in correspondence between various officials of the railway unions, the Railroad Administration, and President Wilson.

In February, 1920, there were 17 railroad organizations, representing various crafts affiliated to the American Federation of Labor,

¹ Report of proceedings in connection with 1919-1920 wage movement. Washington, 1920. Circular No. 1, 20 pp., No. 2, 14 pp., No. 3, 14 pp., No. 4, 16 pp., and Official Circular No. 119, Railway Employees' Department, Washington, Apr. 5, 1920.

claiming to represent 95 per cent of the organized employees and to have a membership of 1,900,000. Recently the officers of the Molders' Union of North America authorized the committees of these organizations to represent their membership also in their negotiations. In addition to these unions there are 18 rival unions, comprising a comparatively small percentage of the organized employees, which include in their membership various grades of employees, one or two of them being made up of minor executives such as train dispatchers and station agents.

A letter from Mr. Walker D. Hines, Director General of Railroads, to President Wilson summarizes the claims of the different classes of railroad employees and the reasons actuating the employees in making them.

The demands for substantial wage increases have been presented to the Railroad Administration's Board of Railroad Wages and Working Conditions at different times since the latter part of last summer by nearly all the classes of the 2,000,000 railroad employees. Among the few classes which have not pressed such demands there is insistence that their wages shall be increased if other related classes receive increases. There are two principal causes for putting forward these claims, one the cost of living and the claim that employees in similar industries outside are receiving higher wages, the other a demand for a leveling up by classes which claimed they had not received equal treatment with related work in other departments.

Mr. Hines says:

As illustrating the complexity and wide scope of these matters, the labor members of the board, in suggesting a basis they thought would bring about equalization, estimated that the cost of such equalization would be approximately \$375,000,000 per annum. This figure was arrived at by taking the average monthly increase of a small group of railroad employees, embracing only about 5 per cent of the total number of railroad employees, and estimating how much additional increase in money per month it would be necessary to give the other classes of railroad employees in order to equalize on certain theories with this small group. Even this small group is now demanding large increases. This figure of \$375,000,000 is much less than the employees are demanding. Broadly speaking, the increase of each one cent per hour for all railroad employees of all classes would, with allowance for incidental overtime, cost considerable in excess of \$50,000,000 per year. The following indicates the principal, but not all, of the contentions advanced by the principal classes of the railroad employees involved:

The Brotherhood of Railroad Trainmen:

Passenger brakemen be increased from \$120 per 30-day month to \$150 for 26-day month.

Baggagemen be increased from \$124.80 for 30-day month to \$160 for 26-day month.

Assistant conductors be increased from \$144 for 30-day month to \$179 for 26-day month.

Freight brakemen in valley territory be increased from \$4.08 per day to \$5.88 per day with 10 per cent increase over these rates wherever the grade exceeds 1.8 per cent.

Yard foremen or conductors be increased from \$5.33 per day to \$7.20 per day.

Yard helpers or brakemen be increased from \$5 per day to \$6.90 per day.

Switch tenders be increased from \$4 per day to \$5.90 per day.

Also time and one-half for all Sunday and holiday service.

Also guaranty of 26 days per month for regular employees in all classes of service.

The Order of Railway Conductors:

Passenger conductors be increased from \$180 per 30-day month to \$225 for 26-day month.

Through-freight conductors be increased from \$5.40 per day to \$7.65 per day in valley territory, with increases in the mountain rate from \$5.81 to \$8.37 per day.

Local-freight conductors be increased from \$5.92 to \$8.33 per day in valley territory, with increase in mountain rate from \$6.26 to \$9.13 per day.

The Brotherhood of Locomotive Firemen and Enginemen:

Road freight firemen to be increased an average of \$1.84 per day over present rates.

Yard freight firemen to be increased an average of \$2.25 per day over present rates.

Passenger firemen to be increased from present average rate of \$4.31 per day to \$6.50 per day, an increase of \$2.19 per day.

The Brotherhood of Locomotive Engineers:

While presenting no specific requests, notice was served that the engineers desired increases in wages proportionate to any increases granted other employees.

All road employees, as distinguished from yard employees, in the four foregoing organizations, get proportionately increased pay per day when they make mileage in excess of 100 miles and in freight service get time and one-half for time consumed in excess of what would be required on the guaranteed speed basis which is 2½ miles per hour.

The Switchmen's Union of North America:

Foremen or conductors be increased from \$5.33 per day or night to \$8 per night and \$7.50 per day.

Helpers or brakemen be increased from \$5 per day or night to \$7.50 per night and \$7 per day.

Switch tenders to receive same rate as helpers.

Time and one-half for Sundays and holidays.

Maintenance of Way and Enginehouse Laborers:

Rate for all mechanics in the maintenance of way department to be increased from basic rate of 53 cents per hour to uniform rate of 68 cents per hour.

Rate for all trackmen and other laborers to be increased from rates running from 28 cents to 40 cents per hour to a uniform rate throughout the United States of 50 cents per hour. The bulk of these employees now receive between 35 cents and 40 cents.

Brotherhood of Railroad Signalmen of America:

An increase of approximately 10 cents per hour for each class of signal employees.

The Brotherhood of Railway Clerks:

An increase in pay of at least 20 cents per hour retroactive to January 1, 1920, and in addition thereto the reestablishment of differentials between certain classes of employees.

Also the immediate elimination of the 43-cent per hour maximum rate established by the present wage orders for freight handlers and other labor in freight houses, storerooms, etc., and time and one-half for Sundays and holidays.

The Order of Railroad Telegraphers:

That the rates received by telegraphers on the Southern Pacific System, which was stated to be practically the highest in the United States on any important railroad, shall be taken as a basis, the rates of all other telegraphers put on the same basis, and then an increase of 17 cents per hour added to rates so established. The equalization alone, leaving out the addition of the 17 cents per hour additional, would cost the

railroads approximately \$13,000,000 per annum, and the 17 cents per hour increase would mean \$36,000,000 per annum additional.

Shopmen:

Increase to approximately 85 cents per hour, for employees now generally receiving 67 and 72 cents per hour.

These demands have now been formally presented to the Railroad Labor Board² created by authority of the new transportation act.³

The Kansas Court of Industrial Relations.

THE MONTHLY LABOR REVIEW for March (pp. 214 and 215) carried a summary statement of the provisions of a law of Kansas establishing a court of industrial relations. Because of the purpose of the court to adjust differences between employers and employees, the account of the law was printed under the general heading "Conciliation and Arbitration." Contemporaneously, Gov. Allen, of Kansas, in an address on the subject of the law, said: "The law creating the Industrial Court in the State of Kansas is not a distant relative of the process of arbitration or conciliation." There is no representation of capital as such, nor of labor as such, but "the court represents the public in the function of government." The method and spirit of the court are of special interest, therefore, as exemplifying a departure from those commonly applied in such cases.

The first decision rendered by this new court bears date of March 29, 1920, and relates to the wages of linemen employed by the Topeka Edison Co. This company furnishes light and power for various citizens and industries of Topeka and Oakland and for the street car systems of the two cities, and was therefore within the scope of the law as a public utility. The case was before the court on the complaint of the attorney general of the State and of four members of the local union of electrical workers to which the employees concerned belonged. The controversy related to hours and wages, and the complainants prayed for a due investigation and ascertainment of the facts, and that such orders and findings may follow as may be just and reasonable.

The company's reply admitted its incorporation and the nature of its business, and also the existence of an unsettled controversy, setting forth its tender of a partial concession to its workers and their rejection of the same. While denying certain allegations of its employees, it "respectfully submits and tenders the issue here presented, and welcomes the good offices of this court in a judicial determination of that which is equitable and just in the premises."

² See p. 49.

³ See MONTHLY LABOR REVIEW, April, 1920, pp. 50-57.

Of this the opinion says:

It would seem, therefore, that while originally this matter was filed as an action upon a controversy, under the compulsory features of the industrial laws of the State of Kansas, it is now before the court more in the nature of a voluntary submission by mutual agreement of a dispute between the above parties.

There was found to be little conflict in the evidence submitted by the two parties. The men were skilled, first-class workers, of unquestioned fidelity, and were engaged in an occupation involving serious hazards. For several years prior to 1916, the customary wage had been \$2.75 per day. In 1916 an advance was made to \$90 per month of 26 days, for a 9-hour day. In May, 1919, a basic 8-hour day was adopted, with a rate of 60 cents per hour, time and one-half for overtime, and double rates for Sunday work. There was a practice of counting time on the job only, though the men had to report at the storehouse, collect material and tools, and travel varying distances on a truck to reach their work. This practice had come into question, and during the progress of the trial it was mutually agreed to count the time both going and coming as well as in the storehouse, and that employer and workers would share this equally.

It was testified that living costs had so advanced that \$4.80 at the present time did not have the purchasing power of either the \$2.75 per day or the \$90 per month, when these were the wages paid. A comparison with rates paid for like work in localities of similar population, and for other work of a comparable nature as to skill, etc., in Topeka was also made. The seven basic principles of the recent Federal railroad law were recited, i. e., wages for similar work elsewhere, cost of living, hazards, skill required, responsibility, character and regularity of employment, and inequalities due to prior adjustments. To these the courts added an eighth: "The skill, industry, and fidelity of the individual employee."

It was pointed out that the law did not use the term, a "living" wage, but a "fair" wage, while also having regard for a "fair rate of return to the owners." Workers of the class under consideration were said to be "in all fairness entitled to a wage which will enable them to procure for themselves and their families all the necessities and a reasonable share of the comforts of life," including intellectual advancement and recreation, the education of their children, and opportunity to provide for sickness and old age. It was also stated that the law allows only the fixing of a minimum wage, leaving the maximum to "depend upon the skill, fidelity, and industry of the employee, the fair and equitable disposition of the employer, the prosperity of the business, and other economic circumstances."

The men had asked for an advance of 10 cents per hour over the 60-cent rate they had been receiving; and with an agreement reached as to

time in the storehouse and on the road, this was really the only point to be decided. The court issued its order ratifying the agreement made, and fixing the rate of pay at 67½ cents per hour for an 8-hour day, time and a half for overtime, and double time for Sunday work, this rate to be the minimum for six months from April 1, unless changed by agreement of the parties with the approval of the court.

On April 23 there were three other cases pending before the court affecting the Amalgamated Electric Workers of Pittsburg, Kans., the firemen and oilers of the Union Pacific Railway, and the maintenance and shop laborers of the Atchison, Topeka & Santa Fe. The court is also conducting a general investigation of the coal-mining situation in the State with a view to stabilizing employment and securing a fuller production. If continuous operation is impracticable such arrangements are to be considered as will work to the advantage of miners in the matter of alternative employments at certain seasons of the year.

British Report on Dock Labor.

THE court of inquiry (instituted under the Industrial Courts Act)¹ set up by the Ministry of Labor, on the joint application of the Port Labor Employers and the Transport Workers' Federation, to investigate the claims of the dockers to a minimum wage of 16s. (\$3.89, par) per day and changes in working conditions, presented its report to the Government on March 31.

The court met first on February 3, with Lord Shaw of Dunfermline as president, and was composed of Messrs. Harry Gosling and Robert Williams (president and secretary, respectively, Transport Workers' Federation), and Mr. Ben Tillet, M. P. (secretary, Dockers' Union) representing the workers; Sir Joseph Broodbank, Sir Lionel Fletcher, and Mr. Frederick Scrutton, representing the employers; and Mr. John Smethurst (president, Master Cotton Spinners' Federation) and Mr. A. Pugh (general secretary, Iron and Steel Trades Confederation), nominated by the ministry of labor as representing employers and workers in other industries.

Messrs. N. Macpherson and G. H. Ince were the secretaries. Mr. E. Revin (national organizer of the dockers) and Mr. James Sexton, M. P. (leader of the Liverpool dockers), were in charge of the case for the workers, while Sir Lynden Macassey, K. C., and Mr. Bruce Thomas, instructed by Mr. G. Grinling Harris, secretary to the employers' committee, were counsel for the employers.

Witnesses from every interested group of people in the United Kingdom appeared at the hearings. The twentieth and final session

¹ See MONTHLY LABOR REVIEW, February, 1920, pp. 41-46.

was held on March 11, but the report was delayed in publication until the president could no longer hope for a unanimous signature.

Regret is expressed that two of the employers' representatives were unable to sign the majority report, as this was the first inquiry under the Industrial Courts Act and it was hoped that a full and public inquiry would facilitate agreement and thus effectively strengthen confidence in the method. The court has power only to make recommendations, but if all parties had agreed to them the probability of their being adopted would be greatly increased.

The majority report concedes practically the whole of the claim made by the dockers. It reviews and discusses the conditions of the industry from every point of view, covering more or less definitely the casual nature of the work, unemployment, underemployment, mode of payment, the representation of labor on port authorities, lack of confidence between employers and employed, labor-saving machinery, decline of output, and other matters. The actual recommendations are a minimum national rate of 16s. a day, a system of registration, the maintenance of unemployed casual labor, weekly pay, and Whitley councils for dock labor, with well-defined powers.

One of the two employers signing the majority report made the reservation (a vital one) that while recommending a substantial increase in wages he could not agree to the establishing of a minimum daily wage. The two signers of the minority report, both employers, objected to the proposal to establish a national minimum wage, and also to the proposed amount, 16s. (\$3.89 par). They base their objections on the ground of the effect on the higher grades and on other industries, owing to the deep-rooted insistence of workers to maintain their differential position. Further, they see many practical difficulties in the way of establishing weekly payments of wages in every port; and, while approving the principle of national joint councils, they do not consider such a question within the scope of the reference to the court; and, finally, they do not consider that the court was called upon to suggest a direct representation of labor on the governing port bodies.

The minister of labor, to whom the report is addressed, is under no obligation to give effect to the conclusions of the court, nor has he power to enforce them, but he informed the parties that if they so desired he would call a joint conference to consider the proposals. Delegates of the unions concerned immediately passed resolutions accepting the majority report; but if, as the minority report suggests, the employers refuse to accept the court's proposals a further dispute may arise.

The report is of especial interest at this time in the United States, owing to the long-standing disturbed condition of dock labor along

the Atlantic coast. The following summary is taken from the London Times of April 1, 1920:

THE FINDINGS.

The findings of the court are as follows:

- (1) That with a view to establishing a national minimum standard (to use the words of the claim) the minimum for day workers and pieceworkers shall be 16s. [\$3.89 par] per day on the basis of the national agreement for the 44-hour week.
- (2) That a system of registration of dock labor should be introduced into all the ports, docks, and harbors of the kingdom.
- (3) That the principle of maintenance of unemployed casual labor is approved.
- (4) That wages of dock labor should be paid weekly, and that this system should be introduced at the earliest possible date.
- (5) That the constitution of a national joint council and its correlative and local bodies should be undertaken for the dock labor industry on the lines of the report of the Whitley committee.
- (6) That these bodies should, failing agreement by the parties, be charged with the settlement of the incidental matters mentioned in this report and of the remaining items of claim.

The powers of many of the port and harbor authorities concerned to impose tolls and charges are regulated by statute. If effect is given to the recommendations contained in this report these authorities may find it necessary to have their powers amplified. The court accordingly recommends that the Government should give immediate facilities for the enactment of the alterations found necessary in the statutory powers of such authorities.

The main portions of the report (White Paper 55, price 3d.) are as follows:

The application contained claims under 10 heads, and it was in the hope of a settlement of these that this court of inquiry was set up. The first of the claims was in the following terms: "That the minimum for dayworkers and pieceworkers shall be 16s. per day on the basis of the national agreement for the 44-hour week."

It became evident that there were public considerations which pointed to the great advantage of a report being given at the earliest date on this head. The court could not be blind to the fact that unrest upon a considerable scale might be allayed by such an individual answer, if promptly given. It addressed itself accordingly to limiting the inquiry in the first instance to this issue, so as to enable the results to be communicated ad interim to the ministry.

Upon the other issues to be settled, reliance was placed upon the good sense and good will of the parties in the direction of adjustment of matters of difference. As things have turned out, and after a full investigation, which was conducted with keenness, but without acrimony, there seems good ground to hope that that reliance will be justified.

Interpretation of Minimum.

The language of the claim is open to a wide construction. Sir Lynden Macassey was well within his rights in interpreting "a minimum" as a universal national minimum which swept away all considerations of special circumstances and which admitted of no exception. In amplification of the grotesque results which he argued might follow from such a settlement, a table was put in of the small ports of the Kingdom, and it was added that there were in addition 874 creeks, estuaries, etc., in which loading and unloading and other forms of labor such as that performed by one or other of the grades of dock laborers took place. In the opinion of the court the matter must be approached by both parties in a sensible and practical spirit.

It would be improper to compare the minimum now asked to be set up with the lowest figure of wage obtained in the scheduled ports. A great evening-up of underpaid work will take place, and the parties indicated that, once the principle of the minimum was settled, this could be done by them without difficulty. In London, for instance, the Port of London Authority pays 11s. 8d. [\$2.84 par] per day, whereas ocean shipowners pay 13s. 9d. [\$3.35 par] per day, while in Glasgow the general rate of payment of a docker is 14s. [\$3.41 par] per day. It may be noted that the pledge given on behalf of the men was in these terms (to use the words of Mr. Bevin addressing this court):

"I am conscious that whatever your decision may be, if the principle of the minimum be established, some people in some ports are going to get more on the first settlement than others. We have faced that, and we have discussed it with the whole of our men. It was assumed by the chairman of the employers at the previous meeting, to take a striking illustration, that if Liverpool received 12s. [\$2.92 par] per day and Glasgow 14s. [\$3.41 par], if you decided on 16s. [\$3.89 par] a day Glasgow would say '18s., because I was above Liverpool before.' That is not so, my Lord. That is clearly understood by every member of the federation in every port in the country."

In these circumstances, to start with 11s. 8d. [\$2.84 par] as a general datum of difference with 16s. [\$3.89 par] while ignoring all the other cases of higher wages and lesser differences would be productive of serious error.

Output and Casual Labor.

It became plain as the inquiry proceeded that the question of a minimum wage could not be dissevered from two other considerations directly bearing upon it. The first of these had reference to the serious problem of output, and the second to the problem—equally serious—of casual labor. Both of these things are not only vitally connected with the dock labor, but they are also of deep importance to the industrial and social well-being of the community at large.

Their bearing on the issue was quickly made clear. Unless increase of output could be obtained, the ports, it was contended, might be confronted with such a situation of financial strain as might seriously cripple trade, and destroy all the advantages which might be supposed to follow the fixing of the high minimum asked. The result might be to paralyze the very industry whose progress and development it was the interest of both parties to promote. As to casualization, it met the court at every turn as a specialty which bore fundamentally upon the main wages question.

Standard of Living.

The true and substantial case presented by the dockers was based upon a broad appeal for a better standard of living. What is a better standard of living? By this is not meant a right to have merely a subsistence allowance, in the sense of keeping the soul and body of the worker together, but a right to have life ordered upon a higher standard, with full regard to those comforts and decencies which are promotive of better habits, which give a chance for the development of a greater sense of self-respect, and which betoken a higher regard for the place occupied by these workers in the scheme of citizenship. The court did not discourage this view; on the contrary, it approved of it; and it is fair to the port authorities and employers to say that its soundness was not questioned. In the opinion of the court the time has gone past for assessing the value of human labor at the poverty line.

Cost of Living.

On behalf of the workers a figure of £6 [\$29.20 par], and on behalf of the employers a figure of £3 13s. 6d. [\$17.88 par] out of London and £3 17s. [\$18.74 par] in the London area was presented to the court as the expenses of procuring a decent standard

of life for a family of man and wife and three children, and Prof. Bowley defended these latter figures with great ability. * * * The claim made is for a minimum daily wage of 10s. [\$3.89 par] It has been difficult to obtain accurate information as to the exact number of hours or, say, of half-days worked per week by the docker who comes under the ordinary denomination of a casual worker. It appears to the court, however, that that average may stand at about 8 half-days out of the 11. The 16s. per full day claimed would, on this average, reach a sum of £3 4s. [\$15.57 par] per week. Upon the footing that the workmen obtained work and continued at work, however, during the whole of the 11 half-days, a sum of £4 8s. [\$21.41 par] would be reached.

Casual Labor.

It was strongly contended that the minimum now to be set up would be pointed to as the ground for claims in other industries. This may be the case, no doubt, but the following consideration has to be kept in view: Dock labor is in a very large proportion uncertain labor. The employees in that branch of industry often run the risk of finding themselves without work at the end of any day, or even any half-day. This raises the whole question of casual labor, and it has serious relations to the claim of the workers.

The court is of opinion that labor frequently or constantly underemployed is injurious to the interests of the workers, the ports, and the public, and that it is discreditable to society. It undermines all security, and is apt to undermine all self-respect upon the workers' part. It is only among those who have sunk very far, and whom the system itself may have demoralized, that it can be accepted as a working substitute for steady and assured employment. In one sense it is a convenience to authorities and employers, whose requirements are at the mercy of storms and tides and unforeseen casualties, to have a reservoir of unemployment which can be readily tapped as the need emerges for a labor supply. If men were merely the spare parts of an industrial machine, this callous reckoning might be appropriate; but society will not tolerate much longer the continuance of the employment of human beings on those lines.

The system of casualization must, if possible, be torn up by the roots. It is wrong. And the one issue is as to what practical means can be adopted of readily providing labor, while avoiding cruel and unsocial conditions.

So serious has the position become that it has evolved habits of mind and body on the part of the workmen themselves which are detrimental to them and on a wide scale deeply injurious. Many workers have got into the habit of thinking that day labor is a sign of independence, and that labor secured even for a week leaves them devoid of that liberty to do nothing which they have come to prize. As in so many other cases mentioned in this report, this habit of mind is in no respect sanctioned by the leaders of the men, and, as properly urged by them, one of the true lines of reform in this trade will be the abolition of the daily wage system and the substitution therefor of the payment of wages weekly.

Weekly Payment of Wages.

The practical difficulty in the way of this conversion is that men have become habituated to subsistence money so as to enable them to avoid hunger. A notable pledge was made by the representative of the claimants, to the effect that if a weekly payment of wages were instituted—which it was agreed would carry in its wake responsibility on the part of the workman for making his own subsistence a matter for thrifty outlook—the leaders of the men would counsel the abolition of the old bad hand-to-mouth habit of pay. With the assistance of a joint industrial council and the correlative local bodies to be hereafter recommended, the court does not think that the ministry need fear the elimination of the old method.

As matters stand, however, the daily wage asked to be fixed is the wage of a class upon the footing that this unemployment and underemployment, lamentable as they may be, do actually exist. Casualization, in short, and that on a large scale, seems to have become part and parcel of the dock industry, and this has been accentuated since the outbreak of war. It was, and it remains, one of the most appalling problems which confront all those engaged in social amelioration or philanthropic effort. Since the war it has reached the dimensions of a serious social disease. The spectacle of men, who, after all, have the obligations of citizenship resting upon them, being assembled at the dock gates, uncertain whether they are to enter the ranks of labor for even half a day or be left a prey to those temptations which spring from idleness, poverty, and a sense of neglect, is not one which can be treated by any independent and humane mind with equanimity.

REMEDIES.

Registration.

The beginning of a remedy, and the condition of it, is a system of registration of all workers at the docks.

Maintenance.

It is not for this court to enter into these details. As bearing, however, on the financial question before it, it feels that it is its duty also to record its view in favor of the adoption of the principle of maintenance. The amount can be settled by the parties or upon reference to the industrial council machinery already alluded to. It may be pointed out that once maintenance is part and parcel of a registration scheme, the objections to registration may quickly disappear. The court accordingly reports its opinion that registration and maintenance should both be adopted, and this in regard to all the labor employed at all the ports of the Kingdom.

Output.

The court now finds itself bound to face the question of output. It confesses its view to be that this question is of more importance than the claim itself. It desires to state broadly that unless a reasonable hope can be entertained that output shall be largely increased, it remains extremely doubtful whether the industry could justifiably be charged with the amount of the claim put forward. The court, however, is of opinion that such a reasonable hope exists; and it thinks it to be its duty to submit to the Government the result of its investigation and labors upon this topic. The radical connection between output and the wages claim is this: Witness after witness indicated that the increased debit for wages was a thing which the industry could stand if only output were attained.

Payment by Results.

In order to facilitate the desired output of which the country stands in imperative need, attention should be given to the system which has given satisfaction in many of the aspects of dock labor, namely, payment by results. It is understood that payment by results is impracticable in some aspects of dock and waterside labor, but, where practicable and desirable, consideration should be given to the extension of the system. The court recommends to the joint industrial council the consideration of the extension of this system of payment by results.

It need not be concealed that great alarm is felt on the subject throughout the country, and by port authorities themselves. It would be a mistake on a very large scale to lay the blame for all the decrease of output upon the men. No unprejudiced hearer of the evidence would venture to do so. Various causes, in addition to the reduction of hours to 44 per week, have contributed toward this disastrous result.

RESPONSIBILITY FOR LOSS OF OUTPUT.

(1) *Government Departments.*

In the first place it is right to begin with the action of the Government departments themselves. Congestion at the ports of this Kingdom means immediate loss and possibly suffering to all who are either consumers of produce or engaged in commerce. The chairman of the Port of London Authority roundly charged Government departments with producing congestion by a lack of due consideration either for the requirements of our people or the accommodation of our ports.

It is not for this court to enter into any controversies between Lord Devonport and the departments or between the departments themselves, or to permit any political considerations or political utterances to divert its mind from the one issue, which was very serious, namely, the production of confusion, delay, and disorganization at the port to such an extent as to increase the hazards of the employment, its uncertainties, and the amount of casualization. In the opinion of the court such an increase did occur.

(2) *Port Authorities and Employers.*

The next class of persons to some extent responsible with regard to the loss of output are the port authorities and the employers themselves. The court can not see its way to make any pronouncement derogatory to these institutions and classes of citizens who share with the great bodies of men employed the credit that under their aid and by their efforts the trade of this country has risen to its enormous dimensions. Nor would anyone desire to observe upon the handling of traffic and upon the administration of trade at our ports during the war without a grateful realization of the enormous services which, in combination with the shipping industry of the country, were rendered during the war. It will never be forgotten how those authorities and that industry faced calamities of unforeseen dimensions in the loss of ships and difficulties in the commandeering of property in ports and on the high seas by the Government which might well, under less able and courageous management and work, have imperiled the continued existence of our world-wide commerce, of the supplies of the necessities of life to our island people, and in particular of that entrepôt trade which is the envy of the world.

Representation of labor on authorities.—The port authorities and employers are engaged in daily contact with enormous bodies of men, and with a system, to which they can not be blind, under which the fringe of unemployment is great and underemployment is greater. In the opinion of the court the organization of all the ports in the Kingdom would be strengthened by the admission of or an increase in the direct representation of labor on the governing bodies. It appears to the court manifest that the labor situation might be ameliorated, conditions of labor might undergo advantageous reform, and loss of output might be avoided, if the direct representation here recommended in principle were introduced.

Absence of confidence.—There is, in short, a fact of much significance which the parties and the Government have to face, namely, the absence of confidence between employers and men. * * * While the war has undoubtedly raised the public estimation of the value of dock labor, it has unfortunately, with all its confusions, prevented employers and authorities from devoting the attention which might otherwise have been given to the problem still outstanding and still serious of the amelioration of the conditions of labor. That such conditions require to be ameliorated no one can doubt. When it is mentioned that men failing to obtain labor at 8 o'clock in the morning and driven onto the streets or back to their homes for five hours till the next chance comes, with no certainty even then of any other result, and when

it is remembered that there does not appear even yet to exist on any appreciable scale within the docks, ports, and harbors of our Kingdom any refuge, place of rest, or even proper or sufficient canteen accommodation, although in the case of thousands of men their homes may be miles away from their place of labor, it will be seen that a sense of umbrage is almost bound to linger, manifesting itself, it may be, in breaches of contract which are in terms indefensible.

Industrial councils.—No proper machinery has existed which could mitigate this conflict or smooth a way for the arrangement of differences and the removal of troubles; the task has been hard in many cases upon employers relying upon contracts being obeyed, but finding themselves, in the absence of such machinery, up against hostilities which might otherwise have been removed. It is in this view that the court thinks that the time is ripe for the immediate formation of a joint standing industrial council applicable to the dock workers of the United Kingdom, and for district councils and works committees, all as set forth in the invaluable report of the committee presided over by the distinguished chairman of committees of the House of Commons, the Rt. Hon. J. H. Whitley, M. P.

Labor-saving machinery.—On this subject the court is pleased to note that no difference in policy was suggested by the parties to the issue. Much enlightenment was displayed on the subject on both sides, and it appears fairly clear that the old suspicions as to the introduction of new methods, up-to-date machinery, even the mobility of labor from dock to dock, and other matters of avoidable friction, have disappeared, and that with the introduction of these councils and a better remuneration for labor, employers will be enabled with greater security than before to bring all the ports of this country in point of organization and appliances up to the level of the best equipped ports in the world.

The court reports its opinion that it is within the power of port authorities, more particularly if representative working men are taken into counsel upon the subject, to make some provision for positions being found for labor displaced. Were this done, the course of bringing the industry and the particular ports up to date and so putting our trade abreast in its working conditions with the best in the world would be facilitated. The loss which would thus arise in any port by our being outrivalled by the adoption of more advanced methods elsewhere would be avoided.

(3) *Men.*

The court desires to report with equal frankness upon the responsibilities of the men themselves. The court is unwilling to enter upon isolated cases of breach of contract however gross. * * *

There are, however, breaches of contract which most unhappily are of a far wider and more general scope; one, a failure to give the contract time, and the other a deliberate slowing down of the work. Both of these cases of breach of contract are extremely serious, and they have an effect which the outside public fails to realize of lessening the output of work to such an extent, as, in the opinion of the court, materially to increase the charges upon industry and the prices of supplies to our people.

Failure to give contract time.—The case of a breach of this contract is so general and widespread as to have become in the case of a large percentage of all the dockers in the Kingdom almost a habit. It is chiselling off, so to speak, of fractions of time at the beginning and end of each half day. * * * In a word, it has, in the opinion of the court, been established that the agreed upon 8-hours day has been improperly and in violation of the bargain reduced by 1 hour. Apart from the exceptional cases just alluded to nobody excuses this, and the court is happy to record that the tradeunions as such and the whole body of their officials have no complicity with

this departure. When it is reflected that the body of men engaged who are actually through their leaders parties to the present issues before the court numbers 125,000, it is not difficult to see that the loss, taken in the gross, which thus occurs to all concerned and in particular to the consuming public, is bound to be heavy.

A moderate estimate would appear to be that with regard to 25 per cent of the number of workmen employed the loss alluded to occurs. This means that in each ordinary working day in the ports of this Kingdom 31,250 hours are lost of labor which is of the utmost value not merely to the prosperity of the ports but to the needs of the nation. As a matter of figures, it may be added that to convert that loss into a yearly one our people at large suffer in the course of twelve months from this system to the extent of 9,375,000 hours.

Slowing down of output.—Upon the second point the course of enlightenment does not seem to have made the progress which might have been anticipated. The court can not be blind to the fact that there is, not arising from exceptional causes but as a part of a deliberate policy, the adoption in not a few cases of a system of slowing down of output. Blame in this respect can only be imputed to a minority of the men interested in this inquiry. The great majority see the system in its true light. The system known as "ca' canny" is loss on every side. The workman gains nothing in time. Even with regard to his habits and character, as well as the dignity of his calling, the things which to every decent man are really precious, loss and deterioration and injury occur. It must need be so under a system which substitutes for honest work a scheme of make-believe. To take the illustration given it is not a case of short time in the apparent bulk, it is time adulterated just as in the other case, say, the case of a merchant, who would make up weight by moistening his sugar or mixing it with sand. There is one answer, and only one, to all such devices: Honesty forbids.

The system may be difficult to eradicate; it may need courage and great manliness to resist the temptations to it. Yet the court is impressed with the fact that the responsible leaders of the men do not sanction it, and treat it not only as wrong, but as a mistake.

Minimum standard.—To trade thus situated it does seem a strong demand that a claim for 16s. a day should be made upon the part of labor; but to labor, situated as described, it seems a natural and just thing to demand that its conditions should be made to square with the circumstances and the pressing and vital needs of the hour as already described. After much consideration the court has come to the opinion that the claim of 16s. per day should be conceded, on the footing that the hopes held out on behalf of the men of increased output shall not be frustrated; that on this footing the claim is supported by justice and should be granted as is now recommended by this court, with a broad appeal to the honor of the men.

Industrial Conditions in Belgium in 1919.¹

THE Belgian ministry of industry, of labor, and of provisioning has just completed a survey of the status of unemployment and of the extent to which various Belgian industries had recovered in December, 1919. The investigation was conducted jointly by the administration of mines and the labor inspection service, the former considering conditions in the extractive and metallurgical industries, and the remaining industries being covered

¹ Extracted from Commerce Reports for Mar. 17, 1920. Department of Commerce, Washington.

by the labor inspectors, whose inquiry was extended to all establishments employing more than 20 workmen in 1914. Comparisons are made on the basis of production and employment on corresponding days in December, 1913, and December, 1919. It is obvious that comparisons made on the basis of one day's output may be somewhat misleading in certain cases.

At first glance the results of the investigation are discouraging from the standpoint of comparative labor output. From the standpoint of actual production in comparison with prewar output, they indicate, however, the remarkable industrial revival already commented upon by all recent visitors to Belgium. The effect of the general introduction of the eight-hour day and of the large amount of work necessary to restore plants and mechanical equipment in some industries is shown by the following figures:

In December, 1919, the production of the coal mines was 94 per cent of what it was in 1913 although labor employed amounted to 104 per cent of the prewar figure. Coking plants were producing 37 per cent as much as before the war, while employing 53 per cent as many as in 1913. Plants for making briquets for the railways and other industrial uses attained 98 per cent of the prewar production, with an increase of 9 per cent over the prewar labor force.

The poor showing made by the iron and steel industry is no doubt attributable to the unusually severe damages suffered by such plants and the consequent necessity of employing large numbers in rebuilding and repairing foundries and mills and in installing new machinery or stolen equipment recovered from Germany. With 60 per cent of the prewar personnel, the iron foundries and steel mills produced in December only 34 per cent as much as before the war, but this was a considerable increase over preceding months.

Still more serious is the condition of the zinc foundries, whose production in December was only 18 per cent of the prewar production with 54 per cent of the labor employed in 1913. Special difficulties in obtaining ores and other raw materials are probably responsible for this large proportion of labor to output. The production of lead was only 9 per cent of the 1913 total, while copper production was about 28 per cent. In the quarries, an important and very diversified Belgian industry, production was slightly less than 50 per cent with a personnel of about 54 per cent.

According to the finding of the Administration of Mines, 115 establishments, including coal mines, coke and metallurgical plants, and quarries of various kinds, gave war destruction as the chief reason for subnormal production, 80 plants specifying lack of transportation facilities, 52 lack of adequate coal, 49 labor shortage, 30 reduction of working day, 23 lack of raw materials other than fuel, and 33 (all quarries) lack of orders.

Nonemployment and Nonemployment Allowances by Government.

ACCORDING to the investigation of the Labor Inspection Service, which ignored production figures, the labor employed in all other Belgian industries in December, 1919, represented 70 per cent of the 1913 total of 412,462 workmen. Half of the establishments covered were employing at least 75 per cent of their prewar personnel.

In the food industries 89 per cent of the former personnel was employed, in the construction industries 86 per cent, in the glass industries 81 per cent, and in the paper trade 78 per cent. Other percentages, based on 1914 employment figures, are: Chemical industries, 74 per cent; ceramic products, 71 per cent; furniture and wood-working, 66 per cent; textiles, 61 per cent (general average reduced by slump in the linen industry); tanneries, 58 per cent. Transportation of various kinds engaged 7 per cent more operatives than in 1913, although the traffic on the State railways is by no means equal to the prewar volume.

It is interesting to note that the industrial revival has apparently progressed most favorably in the Province of Liege, the center of the steel and zinc industry, where 80 per cent of the former workers are employed.

In the Province of Brabant, which includes Brussels, the proportion was 78 per cent, and in Hainaut, the largest coal-producing region, and also an important steel center, 76 per cent. As was to be expected, it is in West Flanders, which suffered most of the actual war devastation, that the resumption of work has progressed least, only 48 per cent of the prewar working population being employed.

Taking Belgian industry as a whole, it appears that in December, 1919, 76 per cent of the former personnel was employed. The notable progress made in the year following the armistice is strikingly shown by the chômage allowances granted to the workmen by the Government. In November, 1918, these unemployment pensions amounted to 23,000,000 francs (\$4,439,000, par) per fortnight; in June, 1919, the total was 12,350,000 francs (\$2,383,550, par); while in November, 1919, it had decreased to 5,300,000 francs (\$1,022,900, par).

At that time some 135,000 households, or about 437,000 people, were receiving Government assistance. This figure includes, however, families of soldiers not yet demobilized, widows of soldiers killed in the war, and disabled soldiers. For instance, in the important industrial Province of Hainaut, out of over 16,000 households entitled to the chômage, only 5,688 included families of able-bodied workmen. Assuming that the same proportion prevails throughout the country—and it is probably considerably less than

this—the number of workmen continuing to draw State unemployment pensions would now be about 45,000.

It must be remembered that during the war many Belgian workmen left for England, France, Holland, and other European countries, and that some of them have not yet returned. Furthermore, since the armistice there has been an appreciable emigration of workmen temporarily unemployed on account of inevitable delays in reopening the foundries and mills. This emigration, together with the very slight increase in population during the war, has resulted in a considerable shortage of skilled labor. It is probable, however, that with the continued revival of the metallurgical and other industries most affected by the war most of these emigrants will return. In fact, the repatriation of workers in the glass industry has been going on for some time.

As stated in previous reports, it is not the damaged and destroyed plants, serious as such sabotage was, that chiefly delays the complete revival of Belgian industry. The continued scarcity of important raw materials, depreciated exchange, lack of suitable labor, the transportation crisis, and above all the continual shortage of fuel supplies are important contributing factors. All these obstacles at present combine to retard production and abnormally increase costs. They also prevent a systematic effort to offset shorter hours and higher wages for labor by more scientific shop management, reduction of overhead expenses, and an effective system of cost accounting.

Change in Labor Policy of the Russian Government.

ALEXANDER Kerenski, the leader of the first Russian revolution, has been publishing in the Berlin *Golos Rossii* a series of articles based on information contained in the *Ekonomitsheskaja Zhisn*, the official organ of the Soviet Government. References in these articles to labor conditions in Russia are quoted by *Wirtschaftsdienst*¹ and may be summarized as follows:

In all the Petrograd factories there has been a marked decline in the number of workmen employed. According to statistics which have been published, 12,141 men are employed in all the factories, but the actual number is only 7,585. During the first half of July, 1919, only 50 per cent of the hands employed at the Neva shipyard were at work, in the second half only 30 per cent, and in the first half of August only 24 per cent. Of those actually working only 33 per cent were men, the rest being women and children. The Putilov Works

¹ *Wirtschaftsdienst*. Berlin, Jan. 23, 1920.

had the names of 7,500 workers on their books, but only 2,800, or 37.3 per cent, were actually at work. The present position of the Petrograd heavy industry, which, with the Putilov, Neva, Baltic, Obuchov, and Baronoski Works, was the most important in Russia, is characteristic as showing how far the industry has been decimated by the dictatorship of the proletariat. These works used to employ between 100,000 and 150,000 hands, of which only 33 per cent are now at work. In other industries the situation is, if possible, worse; one factory after another has been forced to close, and the number of workers in the entire industrial district of Petrograd has fallen to about 7 per cent.

In Moscow, on January 1, 1919, there were 49,490 textile workers, but this number was reduced to 15,290 during the next six months. A similar reduction has taken place in the large works at Tula, Sormov, Kolomna, and in the Urals.

Two facts are apparent from the statistics: That the "nationalized" industries are almost completely ruined, and that the position of the workers under the Soviet régime has steadily deteriorated. That the Russian working classes have been decimated and demoralized by the Bolshevik economic policy is admitted by the Bolsheviks themselves, for Lenin's government has found itself obliged to do away with what was one of the main achievements of the revolution, the essential feature of "nationalization," viz, the works councils and control by the worker.

The chief cause of the terrible situation of the Russian industries is the lack of all discipline and order in the factories. The works councils and factory committees, whose function it was to establish order in the factories, have only done harm, have destroyed the last vestige of discipline, and have played havoc with the plant. All these circumstances have compelled the abolition of the works councils and the appointment at the head of the most important industrial establishments of "dictators," who have unlimited powers over the lives of the workers.

The recently appointed dictators are to endeavor to stimulate production by revising wage scale agreements and introducing a system of bonuses. The following examples of their activities are reported in the *Ekonomitsheskaja Zhisn* (Nos. 207-219):

1. The people's commissioner for the traffic system has decided to introduce a system of individual payments based on the efficiency and output of the worker.
2. The workers' central committee of the Association of Polygraphic Industries has decided to substitute a system of bonuses for the existing wage scale.
3. The Association of Metal Workers has introduced the bonus system with successful results.
4. The following system of bonuses has been introduced in the Podolian State railways: The normal standard output is taken to be 25 per cent of the general

efficiency. If a worker in a given period exceeds this standard he receives an addition of 20 per cent of the normal wage; if not, he receives only two-thirds of it. If he completes his work in half the time, i. e., is responsible for a saving of labor of 50 per cent, he receives a bonus equalling 100 per cent of the normal wage.

5. A similar bonus system has been introduced in the Kostroma Machinery Works; in some cases the manager of the works is permitted to fix the normal output and the bonuses.

6. Statistics have been published as to the results of the bonus system in the Moscow traction system. A bonus is paid if more than 12 days per month are worked. Out of 1,000 street-car conductors employed in July, 76.8 per cent worked for 12 days and 27 per cent of them received bonuses averaging 245 rubles.

7. Piecework rates have been introduced in the paper industry. Production has trebled and the bonus system is being introduced.

8. The bonus system has been introduced on the ships of the Maria River line, and the bonus is being paid in bread.

PRICES AND COST OF LIVING.

Retail Prices of Food in the United States.

THE following tables are based on figures which have been received by the Bureau of Labor Statistics from retail dealers through monthly reports of actual selling prices.¹

Table 1 shows for the United States retail prices of food on February 15 and March 15, 1920, and on March 15, 1919, as well as the percentage changes in the month and in the year. For example, the price of potatoes in March, 1919, was 2.9 cents; in February, 1920, 6 cents; and in March, 1920, 6.8 cents. These figures show an increase of 13 per cent in the month and an increase of 134 per cent in the year. The cost of 22 articles combined² increased 14 per cent in the year. Although there was a slight tendency for several articles to decrease during the month from February to March, the increase in other articles, such as potatoes, butter, and pork chops, offset this decrease. The change during the month in the retail cost of 22 articles combined was a decrease of less than one-tenth of 1 per cent, which for all practical purposes may be considered as no change.

¹ In addition to retail prices of food, the bureau secures prices of coal, gas, and dry goods from each of 51 cities, and publishes these prices as follows: Coal, in the March and September issues of the MONTHLY LABOR REVIEW; gas, in the June issue; dry goods, in the April, July, October, and December issues.

² The following are the 22 articles, weighted according to the consumption of the average family: Sirloin steak, round steak, rib roast, chuck roast, plate beef, pork chops, bacon, ham, lard, hens, flour, corn meal, eggs, butter, milk, bread, potatoes, sugar, cheese, rice, coffee, tea. These include all articles for which prices have been secured each month since 1913 with the exception of lamb, for which the Bureau has no consumption figures

¹ See note 2, p. 68.

Table 2 shows for the United States average retail prices of specified food articles on March 15 of each year, 1913 to 1920, together with the percentage change in March of each year compared with March, 1913. For example, as compared with the price in March, 1913, sugar showed a decrease of 6 per cent in 1914. As compared with March, 1913, the price in March, 1915, showed an increase of 22 per cent; in March, 1916, an increase of 37 per cent; in March, 1917, an increase of 61 per cent; in March, 1918, an increase of 70 per cent; in March, 1919, an increase of 96 per cent; and in March, 1920, an increase of 246 per cent. This means that the retail price

of sugar in March, 1920, was about $3\frac{1}{2}$ times as much as it was in March, 1913.

The cost of 22 articles, combined, increased 106 per cent during the 7-year period.

TABLE 2. AVERAGE RETAIL PRICES OF SPECIFIED FOOD ARTICLES AND PER CENT OF INCREASE OR DECREASE, MAR. 15 OF EACH YEAR, 1914 TO 1920, COMPARED WITH MAR. 15, 1913.

Relative Retail Prices of 22 Articles of Food.

IN TABLE 3, the average monthly and yearly prices of 22 food articles³ are shown as relative prices or percentages of the average prices for the year 1913. These relatives are computed by dividing the average price of each commodity for each month and each year by the average price of that commodity for 1913. Relative prices must be used with caution. For example, the relative price of pork chops in November, 1919, was 200, which means that the money price was 200 per cent of the money price in 1913, or, in other words, the price doubled. The relative price of pork chops in December was 181, showing a drop of 19 points from 200, which is a decrease of only 9.5 per cent.

In the last column of this table are given index numbers⁴ showing the changes by months and years in the retail cost of the 22 food articles weighted according to the importance of each article in the consumption of the average family. Prices are obtained each month for 43 food articles, but only 22 of these are included in the retail food price index because the amounts consumed by the average family have been obtained as yet for only these 22 food articles. These articles comprise about two-thirds of the entire food budget of the average family and reflect with great accuracy changes in the cost of the food budget. The figure representing the cost of these 22 food articles was 200 in February and March, 1920. This shows that as compared with 1913 the cost of these food articles was in March, 1920, double what it was in 1913, and that during the month from February to March there was no change in the cost of these articles.

The curve shown in the chart on page 74 pictures more readily to the eye the changes in the cost of the family market basket and the trend in the cost of the food budget than do the index numbers given in the table. The chart has been drawn on the logarithmic scale⁵ because the percentages of increase or decrease are more accurately shown than on the arithmetic scale.

³ For list of articles, see note 2, p. 68.

⁴ For a discussion of the method used in the computation of these index figures, see MONTHLY LABOR REVIEW for March, 1920, p. 34.

⁵ For a discussion of the logarithmic chart, see article on "Comparison of arithmetic and ratio charts" by Lucian W. Chaney, MONTHLY LABOR REVIEW for March, 1919, pp. 20-34. Also, "The 'ratio' chart," by Prof. Irving Fisher, reprinted from Quarterly Publications of the American Statistical Association, June, 1917, 24 pp.

TABLE 3.—RELATIVE RETAIL PRICES OF THE PRINCIPAL ARTICLES OF FOOD IN THE UNITED STATES, 1907 TO MARCH, 1920.

No hens sold in this month by order of Food Administration.

TREND IN RETAIL COST OF 22 FOOD ARTICLES, COMBINED, FOR THE UNITED STATES, BY MONTHS, JANUARY, 1913, TO MARCH, 1920.

{Average cost for 1913=100.}

Comparison of Retail Food Costs in 51 Cities.

TABLE 4 shows for 39 cities the percentage of increase or decrease in the retail cost of 22 food articles⁶ in March, 1920, compared with the average cost in the year 1913, in March, 1919, and in February, 1920. For 11 other cities comparisons are given for the one-year and one-month periods. These cities have been scheduled by the Bureau at different dates since 1913. For Savannah, Ga., the comparison is given only for the month, as this city was first scheduled by the Bureau in 1920. These percentage changes are based on actual retail prices secured each month from retail dealers, and on the average family consumption of these articles in each city.⁷

TABLE 4.—PERCENTAGE CHANGES IN THE RETAIL COST OF 22 FOOD ARTICLES IN MARCH, 1920, COMPARED WITH THE COST IN FEBRUARY, 1920, MARCH, 1919, AND WITH THE AVERAGE COST IN THE YEAR 1913, BY CITIES.

[Percentage changes of five-tenths of 1 per cent and over are given in whole numbers.]

⁶ For list of articles see note 2, p. 68.

⁷ The consumption figure used for each article in each city is given in the MONTHLY LABOR REVIEW of November, 1918, pp. 94 and 95.

Index Numbers of Wholesale Prices in the United States.

WHOLESALE prices of commodities as a rule were higher in March than in the previous month, according to information gathered by the Bureau of Labor Statistics of the United States Department of Labor. The Bureau's weighted index number, which is built on a larger number of articles than any other currently published series, increased to 253 for March as compared with 249 for February.

Lumber and building materials again showed large increases, the index number for this group rising from 300 to 324, or 8 per cent. Chemicals and drugs increased 4 per cent and fuel and lighting 2½ per cent in price from February to March. Smaller increases were recorded for metals and metal products and for farm products and foods. Cloths and clothing and house-furnishing goods showed no change in average prices.

The more important price changes from February to March are shown in the following statement:

Measured by changes in the index numbers for the 12 months from March, 1919, to March, 1920, farm products increased nearly 5 per cent in price, food 21 per cent, and cloths and clothing over 64 per cent. In the same period fuel and lighting increased 14 per cent, metals and metal products 18½ per cent, and lumber and building materials 96 per cent in price. The increase in chemicals and drugs was 12 per cent, in house-furnishing goods, 51 per cent, and in the group of miscellaneous commodities, including such important articles as cottonseed oil and meal, mill feed, coconut and soy bean oil, lubricating oil, jute, rubber, newsprint and wrapping paper, Manila hemp, and wood pulp, the increase was about 6 per cent. The increase in all commodities combined was nearly 26 per cent.

Changes in Wholesale Prices in the United States.

INFORMATION collected in representative markets by the Bureau of Labor Statistics shows that further increases took place in the wholesale prices of many important commodities in the United States during the first quarter of 1920. Among the articles showing an increase are sheep, mutton, hams, butter, corn and corn meal, oats, potatoes, cotton and cotton goods, shoes, pig iron, steel billets, pig lead, crude and refined petroleum, and gasoline.

On the other hand, some articles, as cattle, fresh and salt beef, hogs, bacon, lard, salt pork, eggs, milk, wheat and wheat flour, rice, sugar, hides, and electrolytic copper decreased in price during the quarter. Rye and rye flour, barley, wool and woolen goods, leather, anthracite and bituminous coal, coke, copper wire, tin plate and pig tin, and spelter showed practically no change in price.

Comparing prices in March with those of a year ago, the Bureau's records show that No. 1 northern spring wheat increased 18 per cent, wheat flour 17 per cent, rice 37 per cent, oats 44 per cent, barley 55 per cent, granulated sugar 56 per cent, and potatoes nearly 229 per cent. Butter, milk, eggs, corn and corn meal, rye, and rye flour showed increases ranging from 4 to 16 per cent. In the same period cotton increased 52 per cent, cotton yarns 89 per cent, bleached muslin 79 per cent, worsted yarns 47 per cent, suitings 72 per cent, storm serge 35 per cent, packers' hides 32 per cent, and chrome calf leather 88 per cent. Men's shoes showed an increase of 48 per cent, women's shoes 57 per cent, coke 34 per cent, copper wire 32 per cent, pig iron 33 per cent, steel billets 42 per cent, pig lead 77 per cent, and crude petroleum 53 per cent. Increases of 12 per cent, 14 per cent, 23 per cent, 37 per cent, and 38 per cent were shown for sole oak leather, gasoline, electrolytic copper, spelter, and refined petroleum, respectively, while wool, and anthracite and bituminous coal increased less than 10 per cent.

On the other hand, mess beef decreased 52 per cent, bacon 31 per cent, lard 25 per cent, hogs 24 per cent, cattle 22 per cent, and fresh beef and mess pork each decreased 16 per cent from March, 1919, to March, 1920. Hams, mutton, tin plate, and pig tin showed decreases ranging from 4 to 14 per cent.

WHOLESALE PRICES IN CERTAIN MONTHS, 1914 TO 1920, AS COMPARED WITH AVERAGE PRICES IN 1913.

Average money prices.

Changes in Cost of Living in 14 Cities in the United States, 1914 to 1919.

THE following table shows the changes in the cost of living from December, 1914, to December, 1919, inclusive, in 14 cities located on the Atlantic and Gulf coasts and on the Great Lakes. These changes are based on actual prices secured by agents of the Bureau of Labor Statistics for each of the periods named.

The first column in the table shows the average per cent of the total family expenditures that is devoted to each of the different groups of items—food, clothing, etc., in the usual family budget.

The succeeding columns show the per cent of increase in prices of the several groups of items in each of the years named, over the prices of December, 1914. It will be noted that from the beginning of the period covered until 1918, inclusive, the increase in the cost of food was, with a very few exceptions, greater than the total increase, but that in 1919 the total per cent of increase was greater than the increase in food except in two cities, thus showing that clothing, rents, miscellaneous items, etc., increased in price in 1919 more rapidly than food.

National Industrial Conference Board Report on Changes in Cost of Living.¹

THE recent report of the National Industrial Conference Board (Boston) on changes in the cost of living from July, 1914, to November, 1919, is the fifth report prepared by the board on this subject. It includes also changes in the cost of the different budget items for the period July, 1919, to November, 1919. The method of securing data was similar to that of the previous investigations and included replies to questionnaires sent to dealers in clothing, furnishings, and fuel in different sections of the country and to representative persons in regard to rent and car-fare changes. It also included use of the index numbers of retail food prices as compiled by the United States Bureau of Labor Statistics.

Nothing was added by the board to the data already published by the Bureau of Labor Statistics in regard to the changes in the cost of food which had been found to have increased in the entire period 92 per cent.

For the period from July, 1919, to November, 1919, the average increases in rents reported from 156 cities were small. In a number of localities they had remained stationary, though this may be partly accounted for by the fact that in many cases leases for a year had been signed previous to this period. No decreases were reported, however, and the average advance for the country for this five-month period was about 8 per cent, making a total increase since July, 1914, of 38 per cent. As rents are largely a local matter no startling differences in different sections of the country were found, but owing to the very general housing shortage it was the general opinion that there could not be a reduction in rents until this condition is remedied.

The rise of 17.5 per cent in the price of clothing for the summer and fall of 1919 was greater than that for any other item in the budget for the same period, while for the entire period from the beginning of the war the increase was 135 per cent. Price schedules were secured from 195 dry goods and specialty stores in 66 representative cities, although no attempt was made to study the question geographically, since it had already been determined from previous investigations that the locality apparently had no effect on clothing prices. From the average prices in November, 1919, trial clothing budgets for a wage earner and his wife were constructed which represent, not a complete outfit, but the amount of clothing which might be purchased in one year. According to these trial budgets the increase in the man's budget, in November, 1919, over July, 1914,

¹ National Industrial Conference Board. Changes in the cost of living, July, 1914-November, 1919. Boston, December, 1919. 24 pp. Research report No. 25.

was 141.2 per cent, in November, 1919, over November, 1918, 26.8 per cent, and in November, 1919, over July, 1919, 20 per cent. The percentage increases in the woman's budget for the same periods were, respectively, 129.5, 22, and 15.3.

The advance in the combined average cost of fuel, heat, and light in November over July, 1919, was 4 per cent, while the advance for the entire period since July, 1914, was 48 per cent. Coal alone advanced about 5 per cent for the five-month period, but this was somewhat offset by the fact that there was considerably less increase in the price of gas and electricity. Information in regard to coal prices was secured from 114 dealers in 42 cities in all sections of the country, but data in regard to the cost of light were secured in less detail, the American Gas Association and the National Electric Light Association supplying estimates of the price changes.

Miscellaneous items, which include household furnishings, tobacco and confectionery, medical care, reading material, amusements, church contributions, insurance and organization dues, and car fare are estimated to have advanced 75 per cent over the whole period, and 7 per cent since July, 1919.

In order to determine the total increase in the cost of living the average percentages of increase for the different items of the budget were weighted according to the relative importance of each item in the family budget. The following table shows the percentage increases in the cost of living in average communities between July, 1914, and November, 1919.

PER CENT OF INCREASE IN COST OF LIVING, NOVEMBER, 1919, OVER JULY, 1914.

Retail Price Changes in Great Britain.

THE following table gives for Great Britain the increase over July, 1914, in the cost of food and general family expenditure for April of each year, 1915 to 1920, and for each month in 1920. The food items included in this report are: Ribs and thin flank of beef, both British and chilled or frozen; legs and breast of mutton, British and chilled or frozen; bacon; fish; flour;

bread; tea; sugar; milk; butter, fresh and salt; cheese; margarine; eggs; and potatoes.

The table gives percentage of increase, and is not one of relative prices, as is the table given for the United States. When making comparisons this should be borne in mind, and to obtain the relative prices it is necessary to add 100 to the percentage as given, e. g., for January, 1920, the increase in cost of food is 136 per cent, the relative price being 236.

The figures represent two comparisons: First, the increase in prices, based on the same kinds and quantities as used in July, 1914; second, the increase, based on the change in the standard of living, resulting from a substitution of one kind of food for another to meet war-time conditions.

The table shows that retail prices of food were 135 per cent higher in April, 1920, than in July, 1914, and that the increased cost of all items in the family budget was 130 to 135 per cent.

PER CENT INCREASE IN COST OF FOOD AND ALL ITEMS IN FAMILY BUDGET IN GREAT BRITAIN BASED ON JULY, 1914.

¹ Decrease.

According to the preceding table there has been an enormous increase in the cost of foodstuffs in Roumania since 1911. Up to the outbreak of the European war the increase in prices was relatively small, and in the case of some very important foodstuffs such as pork, chicken, fish, lard, and rice, a decrease in price is shown. Since 1914, however, prices have risen so rapidly that in October, 1919, the price increases over October, 1911, of the 28 articles listed in the table vary between 339 and 2,081 per cent. The articles showing an increase in price in excess of 1,000 per cent are rice (2,081 per cent), cheese (1,471 per cent), lard (1,321 per cent), bread, first quality (1,246 per cent), and duck (1,166 per cent). Of other important foodstuffs, the price of beef increased 955 per cent, of pork 650 per cent, mutton 712 per cent, eggs 937 per cent, milk 614 per cent, sugar 900 per cent, coffee 566 per cent, and potatoes 600 per cent.

WAGES AND HOURS OF LABOR.

Wages and Hours of Labor in Brick, Chemical, Glass, Leather, Paper, Pottery, and Rubber Industries in 1919.

IN THIS article are presented the results of the investigation of wages and hours in various industries which was carried on as part of the industrial survey of 1919. The industries included are the manufacture of brick, chemicals, glass, leather, paper and pulp, pottery, and rubber goods.

Under the general heading "chemical industry" are included establishments engaged in the manufacture of general chemicals, explosives, pigments, fertilizer, food products, petroleum products, soap, and sugar. In the case of these industries, however, while the products are very unlike, the processes involved are so few and so similar that it was found feasible to combine the data for all the chemical establishments included in the survey under one set of occupation terms.

The glass industry was subdivided according to the nature of the product. In the survey are included establishments engaged in the manufacture of bottles, lighting fixtures, plate glass, table ware, and window glass. In tabulating the material it was found possible in the case of some occupations to combine the data from different branches of the industry, while other occupations were characteristic of one or another separate branch. In the section of Table 4 relating to the glass industry the letters following the occupation terms are the initials of the branches of the glass industry in which the occupations are found. Those occupations which have no letter following them are found in all five subdivisions of the glass industry.

The investigation of the leather industry was confined to establishments tanning sole leather, heavy upper leather, such as cow and calf skins, and light upper leather made from the skin of the goat and the kid. In the table the occupations found in each branch of the industry are tabulated separately.

The report on the investigation of the paper and pulp industry is naturally subdivided into two parts—one dealing with the manufacture of pulp and the other with the manufacture of paper. In

the latter division of the industry were included plants manufacturing news print paper, wrapping and blotting paper, book paper, and writing paper. Processes of manufacture are so similar that it was found possible to combine the occupations for all subdivisions of the pulp industry and likewise those for the paper industry.

Four branches of the manufacture of rubber goods were included in the survey—namely, the manufacture of tires and tubes, of boots and shoes, of mechanical goods, and of rubber hose. As in the case of the glass industry, it was found necessary in the rubber industry to indicate in which branches each of the selected occupations was found. The letters following the occupation titles refer as follows: "F," to the manufacture of footwear; "H," to the manufacture of hose; "M," to the manufacture of mechanical goods; and "T," to the manufacture of tires and tubes. Occupations with no letters following them are found in all branches of the industry.

In the case of the brick and pottery industries no significant subdivision existed, and the material for each industry is presented in a single table.

Table 1 shows the number of establishments and the number of employees in each industry covered by the survey in each State in which the industry was included. The States to be covered in the survey of each industry were selected on the basis of the number of employees shown by the Census of Manufactures of 1914. No attempt was made, however, to apportion the representation in the different States exactly in proportion to the number of employees in them; but enough establishments were included in each State to give fairly typical results for the State. Undoubtedly the lapse of time, and especially the disturbing effects of the war, have rendered obsolete much of the data applying to conditions in 1914, but there is no more recent information available as to the number of employees in the industries in the different States.

The attempt was made to secure as many schedules as possible having pay rolls falling within the first five months of 1919. In some instances, however, special circumstances made it necessary to take schedules for earlier periods. As industry was in an unsettled state immediately after the close of the war and conditions were rapidly changing, the exact date of the material presented is a matter of more importance than it would be in a normal year. Therefore, there is presented in Table 2 information as to the number of pay-roll periods in each industry falling within each calendar month. The table indicates that of the 440 schedules included in the seven industries 31 antedated 1919 and 3 ended early in June of the same year. Ninety-two per cent of the schedules fell within the first five months of 1919. All the material is presented as of the year 1919. In none of the industries, so far as could be ascertained, were there any changes in the rates of wages during the progress of the survey.

TABLE 2.—NUMBER OF PAY-ROLL PERIODS IN SPECIFIED MONTHS, 1918 AND 1919.

The presentation of the material relating to hours and earnings is complicated by the fact that in each of the industries here described pay rolls of different lengths were found. In computing earnings on an hourly basis the length of the pay-roll period is of little importance, but in all tables presenting figures relating to hours the exact length of the pay-roll period becomes of importance. Table 3 indicates how many pay-roll periods of each specified number of days were used in the computations on which the material presented in the final table is based. It will be seen that approximately three-fourths of the periods were 6 days in length. The other one-fourth fell under the general heading of 2 weeks or one-half month. There were periods varying all the way from 11 days to 14 days in length.

TABLE 3.—SCHEDULE DISTRIBUTION BY NUMBER OF WORKDAYS IN PAY-ROLL PERIOD.

At the time of the survey some industries were very active and others considerably depressed. Every effort was made to confine the survey to establishments working full time. In the case of two of the industries included in this report, however, that was found to be impossible, and in using the figures in Table 4 with respect to hours

of operation allowance should be made for the fact that in the glass industry two part-time schedules were included in the State of New York and one each in New Jersey and Pennsylvania; while in the rubber industry one part-time schedule was included in Connecticut. The other schedules in all industries represent full-time pay-roll periods.

The information concerning hours and earnings on which the tables are based was obtained directly from the pay rolls or other records of the companies by agents of the Bureau. Other information was obtained from responsible officials in personal interviews. Wherever the records of the company failed to indicate the time actually worked by pieceworkers during the selected pay-roll period, arrangements were made to have such a record kept for a future period from which record data were afterwards copied. In all cases the figures copied by the agents represented the hours actually worked and earnings actually received by individual employees during the selected pay-roll period.

In Table 4 (pp. 101 to 107) are given the fundamental facts concerning the hours and earnings of employees in the selected occupations of each of the seven industries enumerated above. The first three columns of the table indicate the sex and occupation of the employees to whom the later figures in the same line refer, and also the number of establishments and the number of employees whose records were used in computing the averages. The rest of the table divides naturally into two sections, the former dealing with hours, the latter with earnings.

The facts about hours are shown in six columns. The first of these columns shows the average number of hours actually worked during the pay-roll period by employees on one-week pay rolls; the second shows the average number worked by employees on two-week and half-month pay rolls. It will be seen that there is no constant ratio between the figures for the same occupation in the two columns. This is to be explained partly by the fact that the figures for the two columns necessarily come from different establishments, partly by the fact that the second of the two columns contains data from pay rolls varying in length from 11 to 16 days; and partly by the fact that longer pay rolls show a constant tendency toward shorter average hours of actual work.¹

The two groups of employees are combined in the next column. This column shows the average number of hours per week day worked by the employees in each occupation. This figure is obtained for each employee in the occupation by dividing the number of hours

¹ For a discussion of the effect of the lengthening of the pay-roll period upon average hours see MONTHLY LABOR REVIEW, January, 1920, p. 121.

worked by him during the pay-roll period by the number of week days in the period, adding the daily hours of all the employees in the occupation, and dividing the sum by the number of people in the occupation. The resulting quotient, average hours worked per week day, is the number of hours per day that each employee in the industry would have worked if all had worked six days a week and no more, and if all had worked the same number of hours on each week day.

By multiplying the average hours per week day by six the figures in the column "Average hours worked per week" are obtained. In the next column are shown the average full-time hours per week in each occupation. By comparing average hours worked per week with average full-time hours per week are obtained the figures in the last column relating to hours, the column headed "Per cent of full time worked."

The last four columns of the table relate to earnings. In the first two of these columns are given the average earnings actually received during the pay-roll period by those on one-week pay rolls and by those on two-week and half-month pay rolls. These incommensurable figures are changed to a comparable form by reducing them to average hourly earnings, and the result for all the employees in each occupation is shown in the column bearing that heading.

Finally, in the last column of the table, are shown the average earnings per week for employees in each occupation. This figure was first computed for each employee by dividing his earnings for the pay-roll period by the number of week days in the period and multiplying the quotient by six. The sum of the figures thus obtained for all the employees in the occupation divided by the number of people in the occupation is the average earnings per week for the occupation. It is a hypothetical figure. It represents what each employee in an occupation would have earned in a week if all employees in the occupation had earned the same amount on each week day of the pay-roll period, and if any one employee in the occupation had earned the same amount per day as any other employee in the same occupation.²

A figure for average earnings per week may be obtained by multiplying the average hours per week of an occupation by the average earnings per hour in the same occupation. Weekly earnings obtained in that way may vary considerably from the figures given in the table. Where this variation occurs, however, it is entirely due to additions or subtractions necessarily involved in handling continuing decimals. The two methods are fundamentally identical, as

² For a fuller discussion of the significance and limitations of some of the figures shown in the tables see MONTHLY LABOR REVIEW, April, 1920, pp. 97-99.

may be seen from the following analysis of them. The formula for the method just referred to may be stated as follows:

$$\text{Earnings per week} = \text{hours per week} \times \text{earnings per hour.}$$

$$\text{Hours per week} = 6 \times \text{hours per day} = 6 \times \frac{\text{total hours}}{\text{number of week days}}.$$

$$\text{Earnings per hour} = \frac{\text{total earnings}}{\text{total hours}}.$$

$$\therefore \text{Earnings per week} = 6 \times \frac{\text{total hours}}{\text{number of week days}} \times \frac{\text{total earnings}}{\text{total hours}}.$$

This formula indicates the successive operations involved in computing actual weekly earnings by the method of multiplying hours per week by earnings per hour. It will be seen, however, that this formula readily reduces to the simpler form—

$$6 \times \frac{\text{total earnings}}{\text{number of week days}}.$$

The last formula is exactly the one used in applying the method followed in the table.

The results obtained by this method are substantially correct, but can not lay claim to absolute accuracy. One source of possible error should be pointed out. The practice of working fewer hours on Saturday than on other week days, while by no means universal, is widely prevalent; and the number of hours worked on Saturday varies more or less from establishment to establishment. Wherever fewer hours are worked on Saturday than on other days, the theoretical figure for actual weekly earnings described above will express exactly what it professes to express (namely the amount that would have been earned in a week if the earnings had been uniformly distributed), only in the case of employees for whom Saturdays constituted one-sixth of the total number of days worked by them. In all other cases the figure will vary more or less from theoretical exactness. If the number of Saturdays exceeds one in six, the computed weekly earnings will be somewhat too low; if the number is less than one in six, the earnings will be correspondingly high. Careful experiment has shown, however, that these variations offset one another so largely that the net result is a variation of a few cents at the most in the weekly average for the group, a variation so slight that it may be entirely disregarded.

The earnings represented in the column of earnings per week are average actual earnings. No attempt has been made to compute average full-time weekly earnings on account of the difficulties involved in determining their amount. Such earnings should indicate how much the employees represented in the table would have earned if they had worked full time and no more. In the days when piece-workers and time workers alike were paid at a uniform rate for all

their work regardless of the number of hours per day they worked or the amount of work they turned out, actual earnings of employees for any number of hours per week could be readily and accurately changed into corresponding full-time earnings per week. The prevalence of a higher rate for overtime work and of a great variety of bonus systems in the industrial world of to-day makes the process of changing actual earnings to full-time earnings laborious and the results problematical.

Overtime pay presents few theoretical difficulties. If the exact number of hours of overtime work and the overtime rate is reported for each employee, it is possible to deduct from the figures reported for total hours and total earnings the overtime hours and earnings, and from the remainders to compute an hourly rate for regular time. But the practical difficulties encountered in attempting to determine the overtime hours and earnings of each employee are great. Overtime hours can not be ascertained by subtracting the full-time hours of an employee for the pay-roll period from the hours actually worked by him. Overtime is a matter of daily hours, and overtime hours on one day of the pay-roll period may be offset by less than full-time hours on another day. It frequently happens that an employee whose total hours worked during the pay-roll period are less than the full-time hours of the period still has a considerable amount of overtime to his credit. Moreover, the pay rolls of many establishments afford no indication of the amount of overtime paid for. The extra pay for overtime is frequently handled in practice by "boosting" the hours. For example, in an 8-hour establishment that pays at the rate of time-and-a-half for overtime an employee who works 10 hours in a day is credited on the pay roll with 11 hours. By this method the total earnings of the employee for the pay period can be computed by multiplying his total hours as thus measured by his regular hourly rate. In many cases it is only by obtaining the time record of the employee day by day that overtime hours can be discovered. In establishments in which records are carelessly kept it is not always possible even in that way to determine overtime beyond possibility of mistake.

The effect of computing full-time earnings by the use of an hourly rate containing any element of extra pay for overtime is obviously to show full-time earnings more or less in excess of the amount that could actually be earned in regular time only. An additional difficulty is presented in the case of employees working overtime and receiving a bonus. It becomes necessary to determine for each such employee how much bonus, if any, he would have received if he had performed no overtime work. Sometimes it is readily seen that the bonus would have been earned in regular time. Such is the case, for

example, with an attendance bonus, which is usually paid for regularity of attendance during regular time only. A production bonus, however, can not be so readily apportioned. It will be obvious in some cases that all of it was earned in overtime, but in other cases an approximate apportionment of the bonus between regular time and overtime is the nearest approach that can be made toward determining regular-time earnings.

Still more hopeless would be the attempt to determine how much of such a production bonus would have been earned in full regular time by an employee who worked less than full time in the pay-roll period for which the records were copied and consequently earned no bonus for that period. Production bonus systems are very frequently so arranged that an employee of average ability and industry will earn some bonus if he works full time. But in the case of any individual employee who works less than full time during a pay-roll period there is obviously no possible method of determining how much bonus he would have earned if he had worked exactly full time. For such an employee no method of handling the bonus question would give results which could be depended upon as even approximately accurate.

The purpose of dwelling at length upon the impossibility of making an accurate determination of full-time earnings from the pay-roll data of employees under modern conditions is only partly to explain the omission of figures for such earnings from the following table. It is intended primarily to bring out and emphasize the fact that it is entirely inadmissible to compute full-time earnings for employees in any occupation shown in the table by multiplying full-time hours per week by earnings per hour. For, while the former figure is definite and entirely adapted to the purpose in hand the latter represents the average actual hourly earnings of employees, some of whom worked more than full time and others less and whose average hourly earnings for the period, therefore, may be either more or less than they would have been if the same employees had worked full regular time and no more.

In Table 4 are set forth for each industry in turn the facts concerning hours and earnings referred to in the preceding paragraphs. The chief value of the table lies in its presentation of these facts on a comparable weekly basis. The derivative figure for per cent of full time worked sheds some light on the question of the regularity with which modern industrial operations are carried on. In using the figures of the table for purposes of comparison between different industries or different occupations, due weight should be given to the conditions under which the information was gathered, as set forth in the earlier part of this article.

Wages and Hours of Labor in Denmark.

THE Danish statistical office has made a study of wages of industrial workers on the basis of material supplied by the Danish Employers' Association (*Dansk Arbejdsgiverforening*).¹

The data apply to the quarter ending September 27 and are calculated in the form of average weekly earnings. They cover 100,649 workers. Comparative figures are shown for the year 1914.

Briefly summarized the data are as follows:

AVERAGE HOURLY RATES OF WAGES IN DENMARK, SEPTEMBER, 1914 AND 1919.

[Computations into United States currency made on par value of crown, 26.8 cents.]

City, and sex and class of workers.	Number of workers (September, 1919).	Average hourly rates—		Per cent increase September, 1919, over September, 1914.

Various laws limit the hours of labor of workers in Denmark.² These laws are the apprentice act, bakery workers' law, the general factory act, and quite recently the law on the 8-hour day in continuous industries. Recent agreements between employers and em-

¹ Statistiske efterretningen udgivet af det Statistiske departementet, 18 februar 1920.

Over 10 hours.....	6,123	3.5		
Total.....	175,342	100.0	175,342	100.0

The 10-hour day is a thing of the past in so far as the organized workers of Denmark are concerned. The 59,195 workers who in 1918 worked 10 or more hours per day now work only 9 hours. Only 8 hours are worked on Saturday. There have been no reductions in wages as a result of these agreements.

MINIMUM WAGE.

New Minimum-Wage Awards in Massachusetts and Washington.

Massachusetts.

THE division of minimum wage of the Massachusetts Department of Labor and Industries recently approved the determination of the wage board established to recommend minimum wage rates for women and girls employed in the manufacture of knit goods other than standard lines of hosiery and underwear, and issued a decree establishing the new rates, effective July 1, 1920.

These rates are as follows:

1. For experienced employees, not less than \$13.75 a week.
2. For all others, not less than \$8.50 a week.
3. An employee, irrespective of age, shall be deemed experienced who has been employed in the occupation for at least 40 weeks.
4. These rates are based on full-time work, by which is meant the full number of hours required by employers and permitted by the laws of the Commonwealth.

It is explained that the knit-goods occupation includes all branches of the knit-goods industry, with the exception of staple lines of hosiery and underwear, but that this exception shall not apply to lines used for athletic purposes nor to special lines such as bathing suits, tights, and infants' garments.

This decree is the third entered since the reorganization of the Department of Labor on December 1, 1919, and the fifteenth since the enactment of the minimum wage law of 1912.

To guide it in determining the minimum wages to be fixed, the board made an inquiry into the cost of living of a self-supporting girl in Massachusetts under present conditions, and found the total weekly budget to be \$15.30, distributed as follows:

Board and room.....	\$8.50
Clothing.....	3.25
Laundry.....	.50
Carfare.....	.75
Doctor and dentist.....	.30
Church.....	.10
Newspapers and magazines.....	.20

Vacation.....	\$0. 50
Recreation.....	. 40
Savings.....	. 20
Incidentals.....	. 30
Insurance.....	. 10
Self-improvement.....	. 20
Total.....	15. 30

Washington.

THE Industrial Welfare Commission of the State of Washington recently adopted the following resolution which had been approved by the Public Housekeeping Conference which met to recommend wages, hours, and standards of labor for employees in the different occupations of the public housekeeping industry. The provisions of this resolution become effective on June 2, 1920.

Be it resolved, That this Public Housekeeping Conference does hereby make the following recommendations to the Industrial Welfare Commission in reference to standards of labor demanded for the health and morals of women workers in the different occupations of the Public Housekeeping Industry throughout the State:

That no person, firm, association, or corporation shall employ any female over the age of 18 years in any occupation in the public housekeeping industry throughout the State at a weekly wage rate of less than \$18 or \$3 per day or 37½ cents per hour, such wage being the estimate of said conference of the minimum wage adequate to supply the necessary cost of living and to maintain them in health and comfort.

That no person, firm, association, or corporation shall employ any female over the age of 18 years in any occupation in the public housekeeping industry throughout the State more than six days in any one week.

That no person, firm, association, or corporation shall employ any female over the age of 18 years in any occupation in the public housekeeping industry throughout the State more than five hours without a rest period of at least one-half hour; that a schedule of hours be posted in all cases; that where a uniform be required it must be furnished and laundered by the employer; that when meals are furnished to employees the time used in eating may be deducted in arranging the schedule; that if room be furnished same must be properly heated and sanitary; that there must be separate toilets for women and a suitable room provided for change of clothing and for eating lunches; that women shall not be employed as "bell hops" nor serve as elevator operators after 12 o'clock at night; that when board is furnished \$1 per day may be deducted; and for room furnished \$2 per week may be deducted; that 25 cents may be deducted for breakfast, 35 cents for lunch, and 40 cents for dinner; that in every case there shall be a definite agreement as to whether board and room shall or shall not be furnished; that otherwise the straight wage scale shall prevail.

WOMEN IN INDUSTRY.

Plans for Improvement of Domestic Service.

IT WILL be easily conceded that it requires no country-wide statistical survey of domestic service to convince the public that housewives in general are confronted by a serious shortage in the domestic-labor supply. The situation has become so harassing that it seems likely to result in changes in ideals and methods of household management, in social conventions, and home and community activities. Even the exercise of the age-honored virtue of hospitality is being abridged. To the servantless housewife the entertainment of guests, involving the preparation of food and the washing of countless dishes, becomes a modified joy, raising the question of whether the rewards of a hostess counterbalance the caloric energy expended therefor.

An editorial in the *Journal of Home Economics*, December, 1919, voices a realization of the importance of meeting the household labor problem. After referring to the domestic service studies of the Y. W. C. A., to the New York experiment of the United States Employment Service in placing household assistants, to somewhat similar experiments in other cities, to Lady Londonderry's efforts at organizing domestic servants in England, and to the schemes for similar organization in this country, the editorial states that the American Home Economics Association, "whose work is definitely for the home, has not even a committee on household employment." The editor suggests that that association make some real contribution to the solution of the difficulty and concludes with this interrogation: "Is it not time that we helped either to adjust domestic service to the home, or else show the home how to be independent of it?"

Action Taken Toward Solution of Domestic Service Problem.

New York State College for Teachers.

THE Beta Chapter of the Omicron Nu¹ at the New York State College for Teachers has planned a series of studies and discussions on the "servant problem," covering—

The home or family unit, the social and economic relation to the community; growth of family and service.

Development of public service—what it means and involves; principles underlying service.

Can household service be put on a business basis? If so, what standards should be established?

¹ Honorary home economics sorority.

Physiological and ethical side of service.

Specialization in domestic service work—a place for it in vocational high schools.

A suggested course of study for the vocation.

National Housewives' League.

The dearth of domestic helpers is calling other organizations into energetic action. The National Housewives' League has recently appointed a national committee on household employment, the chairman of which is Mrs. Henry S. Patterson, who has tried the experiment of home assistants in her own household. The league is also being urged to establish in New York City a Bureau of Household Occupations.

Chicago Conference on Household Management.

On January 12, 1920, a conference on household management was held in Chicago under the auspices of the Chicago Woman's Club, the Woman's City Club, Chicago Housewives' League, and the Illinois Federation of Women's Clubs. "The future of the American home," "The Chicago household workers' point of view," "Part-time work," and "Mechanical aids in the home" were among the subjects discussed. Miss Eleanor Richardson, of the Y. W. C. A., gave a talk at this conference, declaring that if we are to get the better type of servant back into the home we shall have to "compete with business on terms of business." She gave a brief statement of the experiment being tried by the central branch of the Y. W. C. A. in New York City in placing domestic helpers on an eight-hour day basis with the whole of Sunday off and a wage of \$12 a week and up. She declared that these girls were given the same information about their prospective employers as were the girls going into industry. Miss Richardson expressed the belief that in Chicago, where the community spirit is strong, an agreement as to a fair and constructive standard for household work could be reached which would bring women back to domestic service. The regulation and systematizing of this service were advocated by Miss Richardson, who also recommended a democratic attitude toward young women in household employment and the raising of domestic work into the dignity of a profession.

Mrs. D. W. Redfield, of the department of home economics and pure food of the Illinois Federation of Women's Clubs, emphasized the need of making housework a profession not only for maids but also for mistresses. She declared that "the business of housekeeping and homemaking comes under three heads—food, clothing, and shelter. The physical work of the home, known as general housework, comes under the first of these, namely, food, and is covered by the business of cooking and cleaning. This is the common meeting ground for the 25,000,000 women 20 or more years of age, whether working in their own homes or in the homes of others." She was in

favor of opportunity being provided for every woman to graduate in general housework and to receive some degree, as R. H. (registered houseworker) or H. E. (household engineer). An authoritative body, she thought, should give examinations at different times of the year in various places, and suggested that the Federal Board for Vocational Education would be the logical agency to work out the scheme. Examinations could then be held in all States and should be available to every woman. The woman who through practical experience has learned the technique of general housework and secures 100 per cent as the result of an examination should be given her degree. Those who fail in some part of the examination should be allowed, after further preparation, possibly under a neighborhood domestic science teacher, another opportunity to pass. Diplomas or badges might be substituted for references.

Mrs. B. H. Badenoch, instructor in the American School of Home Economics, spoke to the conference on the subject of the servantless home, and began with the statement that the most vital point in the success of any woman in her home is her attitude toward her work, adding that as a rule women place too low a value on their work. Mrs. Badenoch's contention seems to be in line with the latest theories of the industrial experts on the relation of psychology to productivity. She gave the following counsel:

Plan what to do, do it, forget it, and recreate. In planning the work alternate standing, walking, and sitting tasks, and sit as much as possible. It is just as easy to sit while ironing, washing dishes, paring vegetables, or making a cake as it is to stand, and it uses much less energy. Seek to make each task as easy as possible, use the fewest motions possible, and then do it the same way each time; in other words, turn it over to habit, the great conservator of energy. Stop work before becoming too tired. Science tells us that one-half the rest will be needed for recuperation and twice the work can be accomplished by so doing. And most important of all, wear loose clothing and sensible shoes (when will women stop wearing their old high-heeled pumps for housework?). Use the back properly (the University of Cornell has a whole bulletin on this important subject) and put rhythm and spirit into the work. With the same form and spirit we can find as much health and exercise in housework as in a game of tennis or golf. Can't we?

According to Mrs. Badenoch the working hours of the home should be reduced to as near an eight-hour day as possible. She holds that household work for a few adults can be easily brought within an 8½-hour day, but this, she admits, becomes difficult in the case of a mother with two or more children. Such a mother would have to adhere strictly to the following fundamental rules to keep within the time limit:

1. Eliminate *all* unnecessary work.
2. Secure family cooperation.
3. Simplify the manner of living, using less form.
4. Study to shorten every operation connected with the upkeep of the home.
5. Work with a definite aim for each day. In other words, build a schedule.

Housekeepers' Alliance.

The Housekeepers' Alliance of Washington, D. C., is formulating plans for domestic service classes for both mistresses and maids at the community centers during the next school year. The organization has also established a placement bureau in the Franklin Public School. The following rules and recommendations have been drawn up for the Alliance's placement office:

1. An employee who leaves an employer without a week's notice shall be placed on probation, given another trial, and if she fails again her name will be stricken from the list of the Housekeepers' Alliance placement office.

2. Insolence shall not be tolerated and shall be considered a cause for dismissal at the discretion of the employer. At the same time employers are urged to safeguard themselves against insolence by observing the Biblical injunction "Provoke not to wrath."

3. Long and faithful service on the part of an employee it is recommended shall be rewarded by an increase of wages, and a good record card of the same be filed at the Housekeepers' Alliance placement office.

4. Employers are urged not to lay too much stress upon ill temper on the part of employees, since experience has proved that a person may live harmoniously with one employer when she has found it impossible to live with another.

5. A thief shall never be directed to employment by the Housekeepers' Alliance placement office. Reports from employers on the status of such cases should be promptly reported to the secretary, but with great care not to accuse wrongfully.

6. A classified list shall be an important part of the secretary's record of the Housekeepers' Alliance placement office, and be a guide for wage adjustment.

7. If an applicant is sent by the Housekeepers' Alliance placement secretary for employment and finds that the opportunity has previously been closed, no notice of this fact having been made to the office, it is requested that car fare be refunded to the applicant.

8. An employer who is a member of the Housekeepers' Alliance shall receive one service a month from the office provided she has secured one satisfactory employee.

9. Adjustments of all grievances shall be made at the Housekeepers' Alliance placement office in the interest of better understanding.

10. Compensation at the present time must be left between employer and employee with the understanding that members of the Housekeepers' Alliance will make every effort to standardize labor and keep down prices.

Forty dollars per month is recommended as a fair price for cooks, that is, those who can prepare food economically and in some accord with the requirements of health. To receive more than \$40, the applicant should have a certificate as evidence that she is qualified by instruction and experience to do fancy cooking.

Thirty-five dollars per month is recommended for a general houseworker.

Thirty dollars per month is recommended as the wage for skilled chambermaids and waitresses.

Three dollars with dinner and \$4 without dinner is suggested as the maximum wage for an evening waiter.

Part-time assistants paid for by the hour are recommended as an aid to solving the domestic service problem, since by this means one employee can serve several families, doing the heavy work in each household and being available at odd times as needed.

Proficiency in a general houseworker who is obliged to combine the positions of cook, housemaid, and waitress must be recognized in this scale of wages.

Providence Housewives' League.

The bureau of household occupations of the Providence (Rhode Island) Housewives' League is an organization for the placing of home assistants.² Reporting on the work of that office for the last year the president, Mrs. Howard K. Hilton, writes as follows:

The bureau has prospered in every way and we have been able to do much educational work among both employer and employee. We are constantly facing new problems, but feel that the bureau has come to stay; and a number of other cities have already copied our idea. We are now to form an association of representatives from these bureaus to meet together for conference and discussion. During the month of February we supplied over 10,000 hours of service and we are practically self-supporting, our idea being that the bureau shall not be a money-making enterprise nor a philanthropical one, but educational.

Domestic Workers' Unions.

Domestic employees themselves are also taking steps toward bettering their working conditions. This is indicated by the fact that the American Federation of Labor reports 10 unions of such workers in the following cities: Los Angeles and San Diego, Calif.; Brunswick, Ga.; Chicago and Glencoe, Ill.; New Orleans, La.; Beaver Valley, Pa.; and Denison, Harrisburg, and Houston, Tex.

The secretary of the Hotel and Restaurant Employees of the International Alliance and Bar Tenders' International League of America reports that in August, 1919, that association established three domestic workers' unions—one in Mobile, Ala., another at Fort Worth, Tex., and another at Lawton, Okla. Last October a union of this character was started in Tulsa, Okla., which has made better progress than the other three. In March, 1920, a charter was issued to a domestic workers' union in Richmond, Va.

Conclusion.

IT IS obvious that recalcitrant domestic workers have forced housewives into a more scientific consideration of household problems. Facing the alternative of doing the domestic work themselves or paying a price for it they never paid before and at the same time granting so-called privileges they never granted before, housewives are weighing in an unwonted manner the relative values of household tasks. This will undoubtedly make for higher standards in home economics.

² See "Efforts to standardize the working day for domestic service," MONTHLY LABOR REVIEW, August 1919, p. 206.

VOCATIONAL TRAINING.

Part-time Instruction.¹

THAT the development of part-time and continuation classes steadily progresses is evident from the reports which come in month by month from the various State educational authorities.

The Iowa State Board for Vocational Education, in addition to the part-time classes for painters and machinists mentioned in the April number of the MONTHLY LABOR REVIEW, is conducting part-time dull-season courses in agriculture in four counties at 19 different centers. The classes are open to persons over 14 years of age who are engaged in farming and who can not take advantage of the regular vocational agricultural courses. They are in session 5 days a week for 10 weeks.

The instruction, which is adapted to local conditions as well as to the special individual needs of the pupils, comprises both classroom instruction and laboratory instruction. One-fourth of the time given to class instruction is devoted to farm crops, one-fourth to animal husbandry, one-fourth to farm shop, tractors, and farm engineering, and one-fourth to arithmetic, bills, letters, and records.

Application of the classroom instruction to actual farm conditions is secured through the personal work of the organizer for the county who is hired for 12 months and who in addition to his duties as organizer has the follow-up work in charge. After the classes have closed he spends his entire time in assisting individual members of the class in the solution of problems peculiar to their own farms.

The State is at present employing four organizers and a number of instructors, all chosen because of special fitness, by reason of training and experience, for this work. Some of them are practical farmers holding degrees from agricultural colleges, some are graduates of liberal arts colleges, who combine practice in farming with experience in teaching, while a few are seniors from agricultural colleges, who have also had agricultural experience.

The county provides each class with \$60 worth of books and charts, and also samples of grains, salts, etc.; the State library commission loans to each center 45 books, most of which relate to the subject

¹ The data on which this article is based were obtained from the Vocational Summary (Washington), March, 1920, p. 194.

studied, and the United States Department of Agriculture furnishes 200 bulletins dealing with various phases of agriculture.

The extent of the movement thus far may be seen in the fact that the training now being given will be directly applied, through the farms represented by the members of the classes, to from 30,000 to 35,000 acres of land now under cultivation throughout the State.

Another example of a part-time school equally as significant but of an entirely different character is that conducted by one of the packing companies of the Chicago stockyards for the boys and girls of its office force. The school has the approval of the State educational authorities and is in part at least maintained by Federal funds granted under the terms of the Federal Vocational Act. The Chicago Board of Education, which is collaborating with the company in this educational work for its employees, provides two high school teachers to take charge of the instruction given. Rooms, equipment, and supplies are furnished by the company.

All office employees between 14 and 18 years of age, and these number about 300 boys and girls, are required to attend the school eight hours a week on company time. About 60 per cent of these pupils are under 16 years of age, and as boys constitute the greater part of this percentage the courses given seem to be especially adapted to them.

The instruction includes a thorough training in problems relating to the packing industry as well as in English, spelling, business correspondence, arithmetic, rapid calculation, commercial geography, civics, and hygiene. Girls under 18 years of age are taught typewriting and comptometer operation. Girls who have had previous training in stenography but lack experience are given a five months' finishing course in English and office practice and at the same time are employed as stenographers by the company. All instruction is made as concrete as possible, the use of textbooks having been practically abolished.

Classes of a similar character have been organized in three other plants, and joint meetings of the teachers once a week promote cooperation and provide a means for the exchange of methods, ideas, and materials, all of which is proving of great value to those engaged in the movement.

The effort which the committee on education of the New York State Federation of Labor is making to bring trade apprenticeship within the scope of the recently enacted part-time school law of New York State, through definite apprenticeship agreements in each trade, is indicative of the attitude of a strong labor organization toward the possibilities of the part-time school.

The proposed agreement as outlined by the committee follows:

*Agreement between Master ——— Association and ——— Union
Covering the Education of Apprentices.*

1. The parties to this agreement hereby pledge themselves to cooperate with the public-school authorities to foster the education and vocational training of the apprentices in the ——— trade to the end that each apprentice shall become a thorough mechanic, with the requisite knowledge of the science and physics of the trade, instruction in mechanical drawing, the mathematics of the trade, the manipulation of tools, and the mechanical processes required for full mastery of the trade. Attention shall also be given to the study of civics, history of the industry, Americanization, and such other subjects as seem proper to develop the technical, moral, and patriotic standards that make for good citizenship and sturdy manhood.

2. Apprentices must have reached the age of 16 years and passed the eighth grade in school before entering the trade. Preference shall be given to boys who have attended ——— trade classes in the public vocational schools. Apprenticeship to cover a period of four years.

3. The ——— Employers' Association agrees to allow apprentices four hours off each week with pay to attend a continuation school during the school term.

4. The ——— Union will withhold membership in the union from any apprentice failing to attend such continuation school.

5. Attendance shall be for the full term of four years. (Subject to approval of the school authorities for apprentices in their eighteenth, nineteenth, and twentieth years.)

6. The parties to this agreement shall each nominate two of their members as members of an advisory board to be approved by the board of education. This advisory board shall counsel and advise: (a) To employ competent teachers; (b) to provide proper courses of study; (c) to purchase or acquire sites and grounds and to purchase, lease, acquire, or construct, and to repair suitable shops or buildings and to properly equip the same; (d) to purchase necessary machinery, tools, apparatus, and supplies.

7. One of each of the representatives on the advisory board of the parties to this agreement, together with a representative of the teaching staff of the continuation school, shall constitute an examining board, whose duty it shall be to pass on the fitness of apprentices to continue in the trade.

8. Examination shall be held at the end of each five-month period of the school term. Apprentices not showing progress consistent with the standards set by the school and the trade can be discharged as not having the qualifications necessary for competency in the trade. Additional attendance at an evening school can be recommended.

9. Apprentices completing the full four years' course shall receive a certificate signed by the presidents of the organizations, parties to this agreement, and the examining board, stating that the apprentice is competent to begin work as a journeyman.

10. Apprentices temporarily out of regular employment shall attend school not less than 20 hours per week.

Report on Apprenticeship in the Building Industry, Great Britain.

AT THE quarterly meeting of the industrial council for the building industry (Building Trades Parliament) held at York (England) on November 25, 1919, a report was submitted by the education committee subcommittee appointed to consider the question of apprenticeship of boys to the various trades within the industry. This report is interesting in that the subject matter

concerns in a general way many different industries and is one compelling the attention of employers and employees.

There are four general aspects of the subject treated: (1) Preparation for industry, the committee outlining its criticisms of the educational system in England as at present conducted, and submitting recommendations for its amendment; (2) the threshold of industry, the committee considering the matter of the selection of a life occupation with special reference to the building trades; (3) training in industry, the committee considering problems existing inside and outside the workshop and suggesting amendments to the "haphazard methods which have prevailed in the past" in order that "the ideal and supremacy of craftsmanship" may be realized and attained; and (4) post-apprenticeship period, the committee dealing "with the position in the industry of the youth who has completed the period of training required to qualify as a journeyman in his trade."

While the committee does not regard training for an industrial, commercial, or professional occupation as being the primary duty of the schools, it suggests that the fact that the average boy has, subsequent to his school career, to earn a living, demands an examination of the educational system from this point of view. It points out some of the defects of the present system and recommends: (1) Elementary schools to develop "the intelligence, imagination, and morale of the scholars without any particular bias, be it commercial or industrial"; (2) central or higher grade schools for "special training of a commercial, industrial, technical, or more advanced 'general' character"; (3) technical schools for boys who show the necessary abilities and disposition to receive the more advanced courses in the technicalities of a trade; (4) secondary schools for those who desire to proceed with the higher branches of "pure education"; (5) universities to offer higher training in any industry which a boy may select. In this connection some suggestions are made as to the form the curriculum should take. The report further recommends that scholarships and other forms of maintenance allowances should be payable by the State in respect of those youths who by their attainments have qualified to remain in full-time attendance at school beyond the age of 14 years.

The committee regards it as very important that a boy should be rightly directed in the choice of a trade or occupation at the time when he passes from school life into the wider field of industry and begins to earn money for himself.

He is passing from the period of discipline and restraint into the comparative freedom of industry; the physical and temperamental changes and characteristics of adolescence are powerful factors, and the idea of independence due to his capacity to earn a wage makes careful supervision necessary. Too early a conception of having reached the stage of manhood may do irretrievable harm.

Reference is made to the juvenile departments of the employment exchanges where employers and prospective employees may be brought together, but the committee believes that "the present methods leave much to be desired." There have been established in connection with these employment exchanges juvenile advisory committees, or choice-of-employment committees, to assist the boys in choosing a suitable occupation and to ascertain the needs of industry and register vacancies that may be available, etc. The committee commends this plan and recommends that it be extended; also that the associations of employers and of workpeople in the building industry be represented on the committees and that each juvenile advisory committee have a building trades apprenticeship subcommittee with direct representation of employers and operatives from each craft in the industry.

Functions of Apprenticeship Subcommittee.

THE committee suggests the following as the functions of this subcommittee, which may be made applicable to other industries:

1. To arrange for addresses to the boys in the schools upon the possibilities, etc., of the trades within the industry, i. e., to stimulate the interest of boys for craftsmanship. Those boys in a group of schools who are about to leave could be brought together in one center for this purpose.

2. To interview (with their parents) the boys who desire to enter a trade within the industry. The committee would have at their disposal full information in regard to (a) the scholastic attainments of the boy, particularly in respect of the inclination he has shown toward manipulative art during his school career; (b) his health record and physical development; and (c) his temperamental qualities, and any special characteristics that may have been observed. The committee will thus be able to advise which (if any) trade within the industry would be most likely to suit the boy.

3. To recommend suitable boys to employers who have the right kind of vacancy.

4. To prepare lists of employers who have the necessary facilities for training in a given trade. We regard this selection of the employer as equally important as the selection of the youth, as it will be admitted that not all employers have the necessary faculty or facilities for training the future craftsman.

5. To insure, by means of visits, regular reports, and occasional interviews that the youth is receiving the right kind of training, both in the workshop and in the technical institution, during his period of apprenticeship. Friendly supervision of this nature will indicate to the lad that there is some one interested in his efficiency, and will have a good moral as well as industrial value.

6. To advise the local education authority in regard to the equipment, selection of instructors, curriculum, etc., in the technical institution. This should conduce to efficiency of instruction and the right relationship between education and industry. This feature will be particularly important in the continuation schools to be established under the new education act.

7. To provide for the transfer of an apprentice from one employer to another, where such transfer is desirable, to enable the youth to receive as much variety of training as possible.

8. To consider and provide for the position of those youths in the industry who can not become craftsmen, but for whom continuity of employment in another capacity may be available.

9. To encourage advanced training in suitable cases where youths show the capacity to take up later posts of responsibility in the industry.

10. To promote the physical, social, and moral well-being of the youths by working in conjunction with boys' clubs, etc.

In considering the subject of training in industry the committee directs attention to the fact that the problem "is concerned with all grades of the working boy, and is not confined to the task of teaching the boy the use of tools or the special duties of his occupation; it also has regard to the health and general development of the youth."

The employer must recognize that he is under an obligation either to teach the youth, or to see that he is taught the trade, and that adequate facilities are available for such purpose. The operative, on the other hand, has need to regard the youth as the future fellow-craftsman whose training in a large measure depends upon the spirit of cooperation manifested in the workshop. It is not the function of, nor possible for, the operative to create in the youth an aptitude for the trade; it is, however, within his sphere to give the boy such assistance and encouragement as will enable him to master the difficulties of the craft.

Other problems inside the workshop relate to the determination of the number of entrants to meet the requirements of industry and its expansion, the method of selection, the age of admission, the length of apprenticeship, the question of promotion, advancement, etc., and the health of the boys in the factory.

That the life of the boy outside the workshop has a considerable effect on his industrial efficiency is generally recognized, and the problem of enabling youths to spend their leisure time judiciously and advantageously must be considered, in the opinion of the committee. There should be facilities for continuing education outside working hours and it is very important that recreational facilities also be provided.

The committee cautions against regarding the completion of apprenticeship as the completion of training in the chosen career. The university courses should be made readily available to the boy who desires to proceed to higher instruction. The boy who shows special aptitude should be given an opportunity to develop further and to qualify for the better positions in industry.

The committee proposes, should its recommendations be approved by the building trades council, to develop a model scheme of apprenticeship to cover workshop and institutional training to serve as a basis for each trade and area; to get into touch with the local authorities in order to establish the right relationship between education and industry, both national and local; and to formulate suggestions for the improvement generally of the position of all youths in the industry.

EMPLOYMENT AND UNEMPLOYMENT.

Employment in Selected Industries in March, 1920.

THE Bureau of Labor Statistics received and tabulated reports concerning the volume of employment in March, 1920, from representative establishments in 13 industries. (The figures for March, 1920, when compared with those from identical establishments for March, 1919, show increases in the number of people employed in 11 industries and decreases in 2.) The largest increases—93.6, 55.4, 46.2 and 37.9 per cent—appear in woolen, men's ready-made clothing, cotton finishing and automobile manufacturing, respectively, while respective decreases of 12.6 and 8.2 per cent are shown in car building and repairing and cigar manufacturing.

All industries report increases in the amount of the pay roll for March, 1920, as compared with March, 1919. The largest increases—183.4—and 163.8 per cent—appear in woolen and men's ready-made clothing, while cotton finishing, cotton manufacturing, and hosiery and underwear show respective increases of 90.4, 70.3, and 69.8 per cent.

The large increase in the volume of employment in March, 1920, when compared with March, 1919, is mostly due to improved industrial conditions and to a revival of business activities following the cancellation of Government contracts during the winter and spring of last year.)

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN MARCH, 1919,
AND MARCH, 1920.

Industry	Estab- lish- ments report- ing for March, both years.	Period of pay roll.	Number on pay roll in March.			Amount of pay roll in March.

In comparing the reports of the same industries for March, 1920, with those for February, 1920, 11 industries show an increase in the number of persons on the pay roll, and 2 a decrease. Increases of 5.6, 4.5, and 2.2 per cent are shown in men's ready-made clothing, paper making, and woolen, respectively. Both automobile manufacturing and silk show a decrease of 0.7 per cent.

When compared with February, 1920, the pay rolls in March, 1920, show increases in all of the 13 industries. The greatest increases are 11.6 per cent in men's ready-made clothing; 10.4 per cent in cigar manufacturing; 9.3 per cent in hosiery and underwear; and 8.3 per cent in car building and repairing.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN FEBRUARY AND MARCH, 1920.

Industry.	Establishments reporting for February and March.	Period of pay roll.	Number on pay roll.			Amount of pay roll.		
			February, 1920.	March, 1920.	Per cent of increase (+) or decrease (-).	February, 1920.	March, 1920.	Per cent of increase (+) or decrease (-).

Cotton manufacturing.	62	do.	54,193	54,977	+1.4	1,117,429	1,154,540	+ 3.3
Hosiery and underwear.	63	do.	33,511	33,741	+ .7	614,687	671,751	+ 9.3
Iron and steel.	107	½ month	163,810	166,732	+1.8	12,075,932	12,887,959	+ 6.7
Leather manufacturing.	31	1 week..	17,228	17,335	+ .6	450,815	458,902	+ 1.8
Paper making.	53	do.	25,487	26,625	+4.5	679,368	724,623	+ 6.7
Silk.	49	2 weeks.	16,875	16,750	- .7	744,513	784,909	+ 5.4
Woolen.	50	1 week..	44,703	45,696	+2.2	1,120,901	1,147,555	+ 2.4

In addition to the data presented in the above tables as to the number of employees on the pay roll, 95 plants in the iron and steel industry reported 138,342 employees as actually working on the last full day of the pay period reported for March, 1920, as against 132,672 for the reported pay-roll period in March, 1919—an increase of 4.3 per cent. Figures given by 94 establishments in the iron and steel industry for March and February, 1920, show that 135,544 employees were actually working on the last full day of the pay period reported for in March, 1920, as against 132,567 for the period in February, 1920—an increase of 2.2 per cent.

Changes in Wage Rates.

IN 12 of the 13 industries there were establishments reporting increases in wage rates during the period February 15 to March 15, 1920, while a firm in one of these industries reported a decrease. A number of firms did not answer the inquiry relating to wage changes,

but in such cases it is probably safe to assume that no changes were made.

Automobile manufacturing.—Approximately 10 per cent of the employees in one firm received an increase of approximately 12 per cent. One establishment gave an increase of 8.3 per cent to 12 per cent of the employees, while 16 per cent of the men in another plant were increased $6\frac{1}{2}$ per cent. An increase of 3.7 per cent, affecting 44.4 per cent of the employees, was reported by one establishment. All of the employees in one concern were granted an increase of 3 per cent and 10 per cent of the force in another plant received an increase of 2 per cent.

Boots and shoes.—Two establishments reported a 15 per cent increase, affecting 85 per cent of the employees in one factory and 7 per cent of the employees in the other plant. An increase of $13\frac{1}{4}$ per cent, affecting $6\frac{3}{4}$ per cent of the men, was reported by one concern. One firm gave an increase of about 10 per cent to about 5 per cent of the force, and an increase of 5 per cent, affecting $6\frac{1}{4}$ per cent of the employees, was reported by another establishment.

Car building and repairing.—Two establishments reported an increase of 10 per cent, affecting 89 per cent of the employees in one firm and 10 per cent of the men in the other concern. One firm gave an increase of 5 per cent to 25 per cent of the foundry men and an increase of 5 cents per hour to the car department hourly men. Forty per cent of the men in one establishment received an increase, but the amount of the increase was not given.

Cigar manufacturing.—One establishment granted an increase of 13.6 per cent to 65 per cent of the employees, while 40 per cent of the men in another factory received an increase of 12 per cent. Thirty per cent of the force in one concern were given an increase of 10 per cent. One firm gave an increase of 90 cents per 1,000 to rollers and 60 cents per 1,000 to bunch makers.

Men's ready-made clothing.—The entire force in one establishment received an increase of about 15 per cent and all the employees in another shop were given an average increase of \$5 a week. One concern granted an increase to 25 per cent of the men but failed to give the amount of the increase.

Cotton finishing.—Ten per cent of the employees in one establishment received an increase of 16 per cent.

Cotton manufacturing.—All of the employees in one firm were granted an increase of 10 per cent while the entire force in another plant received an increase of 8 per cent. One establishment gave an increase of $7\frac{1}{2}$ per cent to all the men and the entire force of one concern were given a 5 per cent increase. Two firms reported an increase of about 5 per cent, affecting all of the men in one factory and 90 per

cent of the men in the other establishment. One firm reported decreases ranging from 5 to 15 per cent, affecting 8 per cent of the employees.

Hosiery and underwear.—One establishment granted an increase of 25 per cent to 3 per cent of the employees. All of the men in one mill were given a 10 per cent increase and another firm reported an increase in the rates of wages but gave no further data.

Iron and steel.—One plant reported increases ranging from 10 to 40 per cent, affecting 72.6 per cent of the employees. Six establishments granted an increase of 10 per cent, which affected all of the employees in four of the plants, 34 per cent of the force in the fifth mill, while the sixth firm did not state the number of employees affected. Four establishments granted the common labor an increase of 10 per cent, affecting 30 per cent of the employees in two plants, 15 per cent in the third mill, and 12 per cent in the fourth firm. Five plants gave an increase of 10 per cent to the common labor, or 10 per cent of the employees, and an increase of 6.8 per cent to the puddle-mill men, or 80 per cent of the force; while another concern that also gave an increase of 10 per cent to the common labor, gave an increase of 10 per cent to the puddle-mill men, which constituted 70 per cent of the employees in that establishment. One plant granted the common labor, or 5 per cent of the employees, an increase of 10 per cent. Four establishments reported an increase of approximately 10 per cent, affecting the entire force in three firms and 88 per cent of the employees in the fourth concern. With the exception of the clerical force, all employees in one firm received increases ranging from 2½ cents to 17½ cents per hour. All the employees in one plant received increases ranging from 6 to 8 per cent, while the entire force in another mill were granted increases ranging from 5 to 8 per cent. Three firms gave an increase of 7½ per cent, affecting 60 per cent of the force, about 20 per cent of the employees, and the bar department, respectively, and the third concern also gave an increase of 9 per cent to the men in the sheet department. One-half of the force in one establishment was given an increase of 7 per cent. One concern granted an increase of 6.8 per cent to 75 per cent of the employees, while another plant gave an increase of 6.8 per cent to the puddle-mill tonnage men, 5 per cent to the finishing-mill tonnage men, and 14 per cent to the remainder of the employees. Three establishments reported a 6 per cent increase, affecting 60 per cent of the employees in the first mill, 50 per cent of the men in the second concern, and 33½ per cent of the force in the other plant. One establishment gave an increase of about 5 per cent to all employees, while another firm reported an increase of 2½ cents per hour but made no further statement.

Leather manufacturing.—One establishment granted increases of $4\frac{1}{2}$, $7\frac{3}{4}$, and $12\frac{1}{2}$ per cent, affecting 20, 28, and 2 per cent of the employees, respectively. One firm gave a 10 per cent increase to all earning less than \$5 per day and a 5 per cent increase to the remainder of the force. Sixty-five per cent of the employees in one concern received an increase of 7 per cent, while 20 per cent of the men in another concern were given an increase of 6 per cent. Approximately 4 per cent of the force in one factory received an increase of about 4 per cent.

Paper making.—One establishment reported an increase of 20.6 per cent, affecting 13.8 per cent of the employees, while the entire force in two mills received an increase of $12\frac{1}{2}$ per cent. Three concerns granted an increase of 10 per cent, affecting all the employees in two plants and about 8 per cent of the men in the other establishment. One mill gave an increase of 8.7 per cent to 34.3 per cent of the force. About 20 per cent of the employees in one establishment were given an increase of about $6\frac{1}{2}$ per cent and another plant reported an increase but made no further statement.

Silk.—Two firms gave an increase of 10 per cent, affecting 60 per cent of the employees in the first establishment and 40 per cent of the force in the other mill. Six per cent of the men in one concern received an increase of 9 per cent, while another firm granted an increase of 8 per cent, affecting 75 per cent of the employees. One establishment gave 40 per cent of the force a wage-rate increase of 7 per cent.

Present Scope and Activities of the Federal Employment Service.^a

THE Employment Service of the Department of Labor exists by reason of administrative arrangement by the Secretary of Labor. The specific provision of the act creating the department in 1913 states that one of the purposes of it is that of "advancing the opportunities of the wage earners for profitable employment.)" Prior to that date, that is, since 1907, the service of placement through the Division of Information of the Bureau of Immigration was limited to "promoting a beneficial distribution of aliens admitted to the United States." The division was looked upon merely as an agency for the better distribution of immigrant labor. With the creation of the Department of Labor in 1913 its activities were expanded into those of a National employment service. The coun-

^a For a comparative account of the British and the United States employment systems, see the MONTHLY LABOR REVIEW for August, 1919, pp. 144-156.

try was divided into eight principal zones, with head offices in each district.

During the war the service greatly expanded under war-time Executive orders and with the aid of liberal appropriations. On October 6, 1917, six months after the United States entered as a belligerent into the World War, Congress appropriated \$250,000 for the service. Later the President allotted \$875,000 to the Department of Labor to be applied to the work of labor distribution. And for the fiscal year ending June 30, 1919, Congress originally made a liberal appropriation of \$5,500,000 and followed it by a deficiency allowance of \$272,000. During that period the service was in absolute control of the distribution of all labor of the country needed in the prosecution of the war. The recruiting activities of other agencies were restricted, if not entirely prohibited, and all the work of supplying labor was centered in the Federal Service, which had under its direction about 950 employment offices.

In 1919, following the termination of the war and a gradual reduction in scope and influence of the service, bills were introduced in both Houses of Congress for the continuance of the work and for placing it on a permanent basis. This was the purpose of House bill 4305 (66th Cong., 1st sess.), introduced May 31, 1919, by the Committee on Labor. Senate bill 1442, introduced June 6, 1919, was identical with the House bill, and was introduced by the Committee on Education and Labor. Senate bill 688 was introduced by Senator Robinson on May 23, 1919, and embodied the provisions of a draft bill drawn by a conference on unemployment which had been held April 23-25, 1919, at the request of the Secretary of Labor, and consisting of representatives chosen by the various State governors and of delegates from the United States Chamber of Commerce, the American Federation of Labor, and the directors and officials of the Employment Service. Joint sessions were held and extensive hearings were conducted on these bills.¹

The purpose of this pending legislation is to bring the State and municipal employment agencies into more effective cooperation with the Federal service by means of subsidies to the several States to encourage them to establish and maintain, according to standards laid down by the central Federal office, agencies for the placement of workers. The bills provide that the Federal Government shall contribute to each State an amount equal to the amount contributed by the State itself.

Thus far none of these bills has come to a vote in either house of Congress, and, coupled with a limited appropriation barely sufficient to maintain the Washington organization as little more than a clear-

¹ National employment system. Hearings before the Joint Committee on Labor, Congress of the United States, 66th Cong., 1st sess., parts 1, 2. Washington, 1919. 715 pp.

ing house, the service has been compelled to play a very limited part in the placement of labor since the signing of the armistice. At the present time the active works of placement is done by the public employment offices of the States and cities, while the Federal service receives and tabulates the activities of the local offices which may desire to continue cooperating with the central organization in addition to coordinating and stimulating the activities of the States. The sundry civil bill for the fiscal year 1920 carried an appropriation of \$400,000 for the service. At the time it was hoped that the bills establishing a permanent service by law would be enacted by the end of 1919; hence it was proposed to spend this \$400,000 within the five months, until the permanent service should be reorganized. With the assistance being rendered by private organizations and by the States and municipalities, it would therefore have been possible to carry on the service upon a fairly adequate basis for the five months. It was soon realized that the bills creating a permanent service would not be passed in time, and it therefore became necessary to further retrench in expenditures. The annual report of the service for the fiscal year ending June 30, 1919, thus characterizes the result of cutting down its appropriations.²

The result of the necessary reductions has meant the separation from the service of at least 80 per cent of the personnel, the closing of approximately one-half of the placement offices throughout the United States, the entire elimination of such special services as the handicap section and the professional and special section, the discontinuance of the publication of the official organ of the service, known as the United States Employment Service Bulletin, and the temporary abolishment of the farm service division.

Present Organization.

THE present organization of the Federal service as a national clearing house is set forth in a circular of the Director General of March 8, 1920. The Federal service does not maintain any offices of its own but works through the public employment exchanges of the States and cities. In those States where a public system of employment agencies is operating, the head of that system is a dollar-a-year man of the Federal Employment Service. This is the case in the States of California, Colorado, Connecticut, Illinois, Indiana, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New York, Ohio, Oklahoma, Pennsylvania, and Wisconsin. In the other States the labor commissioner or his deputy or other person designated by the governor acts as the representative of the Federal service. There are 7 States in which no cooperation

² Annual report of the Director General, United States Employment Service, to the Secretary of Labor fiscal year ended June 30, 1919. Washington, 1919, p. 56.

between the State and Federal service has been established; that is, the service has at present cooperative arrangements with 40 States and the District of Columbia. In Maine the three offices communicate directly with the Federal service without the cooperation of the State. In Virginia one municipal office is cooperating with the Federal service. In Nevada, Utah, and Wyoming only one Federal office is maintained in each, and no Federal or cooperating offices exist in Idaho, New Mexico, Tennessee, and Vermont. Cooperative arrangements are in progress of completion in Delaware and New Hampshire. Altogether the Federal service has 227 local employment exchanges. The cities in which the offices in the various States are located are as follows:

¹ Municipal office.

In most States where active public systems are in operation there is little difficulty in securing cooperation in the regular reporting of work done. In some States, where means are lacking, the Federal service makes small monthly allotments to assist in paying for necessary statistical work and the compilation of reports. In other States certain private organizations cooperate with the Federal authorities in maintaining the exchanges. Among such organizations are the community service, groups of business interests, chambers of commerce, the Young Men's Christian Association, the Red Cross, and the American Legion.

The State representatives and directors are merely channels of communication through which the State and municipal offices report. The local offices report their surplus of registrations or help-wanted calls to the State director or Federal representative and these are matched against each other, so that through the State director or representative there is presumably maintained a system of clearance between the local offices. The problem now before the service is to establish a more effective system of interstate clearance.

In its circular of March 8, 1920, the Employment Service took the first step toward a system of zone clearance for matching the surplus of labor in one State against the deficit in another. The country has been divided into 13 labor clearance zones corresponding generally with the Federal Reserve bank districts. The 13 zones with their headquarters and the States included under each are as follows:

FEDERAL EMPLOYMENT SERVICE LABOR CLEARANCE ZONES.

Zone.	Headquarters.	States included.
1	Boston, Mass.....	Massachusetts, Maine, Vermont, New Hampshire, Rhode Island.
2	New York, N. Y.....	New York, Connecticut, New Jersey.
3	Harrisburg, Pa.....	Pennsylvania, Delaware.
4	Columbus, Ohio.....	Ohio, West Virginia.
5	Raleigh, N. C.....	Maryland, Virginia, North Carolina, South Carolina.
6	Atlanta, Ga.....	Georgia, Alabama, Mississippi, Louisiana, Florida.
7	Chicago, Ill.....	Illinois, Indiana, Michigan, Wisconsin, Iowa.
8	St. Louis, Mo.....	Kentucky, Missouri, Arkansas, Tennessee.
9	St. Paul, Minn.....	Minnesota, North Dakota, South Dakota, Montana.
10	Kansas City, Kans.....	Nebraska, Kansas, Oklahoma, Colorado, Wyoming.
11	San Antonio, Tex.....	Texas, New Mexico.
12	San Francisco, Calif.....	Arizona, Utah, Nevada, California.
13	Portland, Oreg.....	Idaho, Oregon, Washington.

As soon as funds are made available for the purpose it is proposed to establish in each of the labor clearance zones a zone clearance office under a paid zone clearance officer. At present, however, it has been possible to put paid Federal directors in only three of the zones, namely, zone No. 6, centering at Atlanta, Ga., and comprising the States of Georgia, Alabama, Mississippi, Louisiana, and Florida; zone No. 7, with headquarters at Chicago, Ill., and including the States of Illinois, Indiana, Michigan, Wisconsin, and Iowa; and zone No. 10, with headquarters at Kansas City, Kans., and including the States of Nebraska, Kansas, Oklahoma, Colorado, and Wyoming. In the remaining 10 zones the unpaid representatives in the State where the headquarters of the zone is located act as zone clearance officers, in addition to their other functions of State representatives. Respecting the designation of the three zones with active paid zone clearance officers, Circular No. 2 of March 8, 1920, of the Employment Service, states that "these assignments have been made with a view to the best adaptation of the available resources to the industrial and agricultural requirements of the various zones." These zones represent in a general way the agricultural region of the Southern States, the harvest region of the Middle West, and the industrial district centering at Chicago, Ill.

Under the cooperative agreements which the various States have with the Federal service, all local placement offices within a State report direct to the Federal director for that State. Circular No. 2, already quoted, states further: "The national clearance system depends upon the existence in each State of a comprehensive and effective system of clearance within such State, and it is assumed that, so far as possible, each State will supply its immediate needs from its own resources of workers and of industrial opportunities. Any balances of either opportunities or applicants remaining undisposed of within any State should be reported by the Federal director for that State to the zone clearance officer, and, if undisposed of within the zone, eventually reported by the zone clearance officer to the national clearing house at Washington."

The functions of the zone clearance officer can not be better defined than in the words of the circular in question:

It should be understood that the functions of zone clearance officers are merely executive and not supervisory in any sense. The Federal director is the sole representative of this service in his State so far as employment activities are concerned. The duties of zone clearance officers involve merely the coordination of the activities of the Federal directors for the various States within their zones and do not extend to soliciting opportunities for employment, recruiting workers, or placement work of any kind.

Under the plan of operation each State cooperating with the Federal service secures for its own use the following information:

(a) A daily report of labor surplus and of labor wanted from each of the public and affiliated employment offices operated in the State.

(b) Weekly or more frequent reports from labor organizations of men seeking employment.

(c) Weekly or more frequent reports as to labor wanted from local boards of trade, chambers of commerce, and other employers' organizations.

(d) Information as to men or women wanted derived from the advertising columns of newspapers, from communications from employers, or from systematic inquiries pursued from time to time among employers of labor.

These reports by the States will be collated by the zone clearance officer of the zone in which the respective States are located and forwarded to the Federal service at Washington.

After the State organization has effected the local shifting of labor on the basis of the information so gathered, the surplus is reported to the zone clearance officer on a prepared form. The same form is also adaptable for clearance between States and zones to the National office at Washington. The forms below are the ones used.

U. S. DEPARTMENT OF LABOR.

U. S. EMPLOYMENT SERVICE.

REPORT OF APPLICANTS NOT PLACED AND WILLING TO LEAVE THE CITY.

City _____
Date _____ Superintendent _____

Name of applicant.	Principal occupation.	Other experience.	Single, married, or widowed.	Age.	Sex.	Color.	Minimum wage demanded.	Do you recommend applicant?	Limit applicant can pay for transportation.

INSTRUCTIONS.—Fill out this report daily and send in with daily report. When registering applicants, be sure to ask if willing to leave the city, and enter answer on the card. Before dismissing applicants, after failure to place them, ask for those willing to leave locality. Report only those willing to leave. This report must show the situation at the close of the day, the latest canceling all previous reports on this form: all applicants, whether previously reported or not, should be included hereon.

MONTHLY LABOR REVIEW.
U. S. DEPARTMENT OF LABOR.
U. S. EMPLOYMENT SERVICE.

REPORT OF ORDERS FOR HELP UNFILLED AND IMPOSSIBLE TO FILL LOCALLY.

City _____
Date _____ Superintendent _____

Kind of work.	Number wanted.	Probable wages.	Hours.	Sex.	Color.	Age limit.	Duration of job.	Latest date for filling order.	Amount employer will provide for transportation.	Probable cost of board.
.....										
.....										
.....										
.....										

INSTRUCTIONS.—Fill out this report daily and send in with daily report. Report only those orders which will allow sufficient time to transfer applicants and obtain all of the information requested. If necessary, use more than one line in giving details of orders.

The form for reporting “male” placements is shown below. The form for “female” placements is identical. It is also further directed that the report should specify, whenever workers are wanted, the specific plant needing them, the wages paid, and the living conditions afforded. For this latter information no special form of inquiry is demanded, a letter giving the necessary information being sufficient. In addition, telegraphic reports should be submitted in any case of acute shortage or surplus of labor, indicating the need for immediate relief.

(Signature) _____,
Federal Director.

From these office reports the statistical reports are made up. On the "male" report are shown occupations classified as skilled, unskilled, and clerical and professional, and on the "female" report the occupations are classified as "domestic," "industrial," and "clerical and professional."

The matching of the "labor surplus" against the "labor wanted" takes place daily within each zone, while interzone or national clearance will be effected by the national clearing house at Washington on the basis of weekly or more frequent reports of "labor surplus" or "labor wanted." The zone clearance officers are also required to report weekly, or more frequently, the state of the labor market in all parts of their respective zones. While the zone clearance officers usually communicate only through the national office at Washington, they are permitted in case of emergency to communicate directly with the zone clearance officer of an adjoining zone with a view to effecting directly and without loss of time the adjustment of labor surplus and demand as between such two or more zones.

The Federal service hopes to be able to furnish a weekly bulletin of such information as has been described above covering the entire country, and also by the publication of a monthly summary of labor and employment conditions throughout the United States, with reports of registration placements and clearances and full information as to industrial conditions and prospects in this and foreign countries.

Statistics of Operations.

EXCEPT for the period of the war, the Employment Service has never had a monopoly of the placement of labor, and although it practically dominated the field during the war, naturally a considerable amount of labor was placed and moved without its intervention. In a time of great demand for labor the workers are not likely to make full use of the employment exchanges. For these reasons, therefore, the statistics of operations of the Service can not be used as an index or criterion of the state of the labor market. At the most, they reflect a varying and fluctuating amount of public service rendered to employers and employees of the country.

Junior Division.³

WITH the curtailment of the Service at the end of 1918 following the armistice, among other divisions discontinued was the Boys' Working Reserve. The elimination of this service would have left uncared for, and without means of assistance in finding positions, the thousands of boys then in agriculture for whom the division had been established. Other thousands in industry for whom no provision as respects placement and entry into industry had ever been made were also to be considered.)

The purpose of the Junior Division, which took the place of the Boys' Working Reserve, was the "guidance and placement of boys and girls under 21 years of age." The junior work is done in close cooperation with the public schools and with other agencies interested in juvenile problems.

³ See also Monthly Labor Review of the U. S. Bureau of Labor Statistics, February, 1919, pp. 117-119.

The enterprise is still in its initial stages, although begun actively in March, 1919. Cooperation has been established with the educational authorities in New York City, Boston, Mass., Providence, R. I., Philadelphia, Pa., Pittsburgh, Pa. (where two offices are maintained), Cleveland, Ohio, South Bend, Ind., Milwaukee, Wis., St. Paul, Minn., and Benton Harbor, Mich. The National Employment Service generally pays half the expenses and the local school system half. Local school officials are in charge of the active work of placement. The Federal office sets standards and furnishes guidance and counsel in the work.

In order to build up a staff of trained vocational guidance workers the National Employment Service has undertaken to establish or pay for study scholarships in the universities. Thus far only four scholarships—at the University of Chicago—have been created. It is not claimed that the service has accomplished very much as yet. Its main significance lies in the fact that it has made a practical beginning in vocational guidance and placement on a national scale. It may succeed in nationalizing the problems of juvenile placement.

Labor Market in Germany and Switzerland.

Germany (January, 1920).

ACCORDING to a report of the German Statistical Office summarized in the *Deutsche Allgemeine Zeitung*¹ the German labor market in January was still dominated by the coal shortage. The effect of the railway strikes and the stoppage of traffic on the most important waterways was very manifest.

Reports from 35 trade-unions showed that 153,566 members out of 4,719,225, i. e., 3.3 per cent, were out of work in January. On December 30, 1919, the trade-unions reported 131,598 out of 4,495,743 members, i. e., 2.9 per cent, out of work. In January, 1919, 165,178 out of a total of 2,520,585 trade-union members, or 6.6 per cent, were unemployed. The number of persons receiving unemployment allowances on February 1, 1920, was 371,675, according to the report of the demobilization commissioners (on Jan. 1, 1920, their number was 386,818). For every 100 vacant positions reported to the public employment offices in January there were 183 male or 109 female applicants, as compared with 189 and 125 in December, 1919. Another index of the state of employment is the membership of the sick funds, for every employed worker must be a contributory member of such a fund. According to the reports of 4,910 sick funds the number

¹ *Deutsche Allgemeine Zeitung*. Berlin, Feb. 28, 1920. Evening edition.

of compulsorily insured members increased during January, 1920, by 37,924, or 0.4 per cent, the number of male members increasing by 0.6 per cent to 5,283,565, and that of female members by 0.2 per cent to 3,280,029.

Switzerland (February, 1920).

THE monthly report of the Swiss Federal Central Employment Office² for February, 1920, indicates a marked improvement of the labor market. In the case of men there were in February 7,053 vacant positions as against 5,810 in January, an increase of 1,243. The number of male applicants, on the other hand, decreased from 8,759 in January to 7,752 in February. For every 100 vacant positions for men in February there were 110 applicants, as compared with 151 in January, 1920, and 197 in February, 1919. Unskilled building trades' workers, electricians, plumbers, firemen, machinists, saddlers, bakers, butchers, and printers were still unemployed in large numbers. Considerable unemployment prevailed also among certain groups of workers of the watch, embroidery, and hotel industries, clerks, stockkeepers, packers, and factory workers. About 300 peddlers were idle, peddling in the country having been prohibited owing to a live-stock epidemic. More than 200 professional men were also idle. In agriculture the demand for labor exceeded the supply. Blacksmiths, carriage makers, masons, and miners were also in great demand.

In the case of female workers the demand exceeded the supply. The number of vacant positions for women increased from 3,277 in January to 3,330 in February. There were only 2,261 applicants to fill these 3,330 vacancies. The number of applicants per 100 vacant positions for women was 68 in February as against 65 in January. Female help is most in demand for domestic service, in the hotels, and in the textile industry.

INDUSTRIAL HYGIENE.

Opportunities for the Study of Industrial Medicine in the United States.

By AUGUSTA SHUFORD.

MODERN industrial medicine has received the endorsement of economists, sociologists, and physicians as one of the principal means upon which hope of securing better industrial and social conditions must be based.

The "new specialty," or "mass medicine" as it is frequently called, has been variously defined. Many physicians use the term "industrial medicine" as if its meaning were limited to the treatment of industrial accidents and occupational diseases, but this idea is rapidly giving place to a larger conception of its scope, based upon the growing recognition of industrial medicine, and particularly of that important part of it known as industrial hygiene, as a very vital factor in preventive medicine. Perhaps the best definition is that which recognizes it as all branches of medicine and surgery in their application to the prevention and treatment of accidents and sickness in industrial workers. The term will here be used in this last sense, though the exactness or consistency with which it is applied to the curricula of the different institutions cited is not vouched for.

The study of specific poisons and diseases in relation to certain occupations is an old one, but it has never been a popular branch of medicine. In the last few years employers of large numbers of people have begun to estimate the advantage to themselves of retaining the services of special physicians to supervise the hygienic conditions in their plants and to attend their sick and injured employees, so that at present a considerable number of physicians are thus employed, while others are engaged in the care of Federal and other public employees. A few public clinics for the treatment of industrial accidents or diseases, or both, have also been established. But while such avenues have been opened for the practice of industrial medicine, physicians who wished to specialize on this subject have, up to the present time, found meager facilities offered for training for their work. The lessons of the war and of reconstruction have, however, drawn marked attention to economic waste through accident and ill health and to the rôle which industrial medicine can be made to play, by reducing these, in the adjustment of industrial and social problems. Very recently steps have been taken to provide adequate training in industrial medicine in a few of

our educational institutions, while the subject is receiving more or less attention in a number of others.

This article is based mainly upon answers to letters sent to the heads of medical colleges and of the medical faculties of universities, inquiring as to the facilities offered by educational institutions and in clinics for the study of industrial medicine. No attempt is here made to give an exhaustive list of educational institutions including industrial medicine or hygiene in their curricula or of clinics specializing in the treatment of industrial diseases or accidents, but merely to present a substantially true picture of the situation regarding the facilities offered for the training of industrial physicians, by noting the most conspicuous work being done along this line and citing typical but less ambitious efforts.

Educational Institutions Offering Courses in Industrial Medicine.

INDUSTRIAL medicine, where it has received any attention at all in the curricula of medical colleges and of universities in this country, has been an outgrowth from a course devoted to public health and has usually been offered as part of such a course.

Courses Leading to Degree in Industrial Medicine or Hygiene

Harvard University Medical School, Boston, Mass., was the first institution to establish a course leading to a degree in industrial hygiene and is the only institution which offers a doctorate in the subject. Work was begun during the session of 1918-19, and according to the plan then inaugurated and which was adopted for the session of 1919-20, when the enterprise was affiliated with the work in public health already established by Harvard University and the Massachusetts Institute of Technology, courses leading to two degrees are open to students holding the degree of doctor of medicine—a certificate in public health in industrial hygiene, obtained after one year's work (eight months in residence), and a doctorate in public health in industrial hygiene, obtained after two years' work. For the session of 1920-21 elective eight-month courses in industrial medicine are to be open to members of the fourth-year class in the medical college.

Courses leading to the certificate in public health in industrial hygiene include the following subjects: Applied physiology of industry, methods of air analysis, industrial toxicology, vital statistics, industrial sanitation, preventive medicine and hygiene, industrial health administration, employment management, workmen's compensation and the legal aspects of industrial disease, nutrition, industrial surgery, orthopedic surgery, and industrial medicine. These subjects also form the work of the first year for candidates for the degree of doctor of public health in industrial hygiene, the second

year being devoted to an investigation upon some phase of industrial health. Among adjunct lectures and accessory courses available for students this year are the Cutter lectures in preventive medicine and a course of Lowell lectures, both by Dr. Thomas M. Legge, chief medical inspector of factories in Great Britain.

Work in the occupational disease clinic of the Massachusetts General Hospital is required of all students of industrial medicine who possess the medical degree.

The school of public health offers two degrees to graduate non-medical students: Doctor of philosophy in hygiene and a certificate in public health. Candidates for these degrees may also take selected courses in industrial hygiene. Women are admitted, through Radcliffe College, as candidates for these degrees, and to all individual courses in industrial hygiene, but not as candidates for the medical degrees in industrial hygiene.

A general survey of psychiatric work in relation to industry is being made and it is hoped soon to extend the work in industrial hygiene into this almost unworked field.

The University of Cincinnati Medical School, Cincinnati, Ohio, established in 1919 a department of industrial hygiene and public health.

By the plan outlined for the term beginning in October, 1919, the course of instruction is to occupy one school year, be open to graduates in medicine, and lead to a certificate of public health in industrial medicine. The program calls for (1) the training of students in industrial medicine and public health, and (2) field work in industrial medicine among industries in the district. The field work undertaken has consisted largely of surveys and inspections of plants in terms of safety hazards, occupational disease hazards, general sanitation, physical examinations, medical relief, absenteeism, turnover, etc. Up to December 19, 1919, surveys of about 60 plants in Cincinnati had been made.

The plan also includes the cooperation of the department with the National Safety Council, the safety director of the department being the local secretary of the council. A course of 15 lectures, covering the fundamentals of safety and sanitary principles, is given at the university in the evening and is open to students of the medical college, safety engineers in the city, and students in engineering; and a course of eight lectures on industrial relations for executives is open to medical students and employment managers of the various plants.

The training of students in the clinical aspects of industrial medicine is provided by intimate contact with the industries of Cincinnati. In addition, an occupational disease clinic in the Cincinnati General Hospital is being organized.

Medical Courses Which Include Industrial Medicine.

A number of medical colleges include courses in industrial hygiene, either elective or prescribed, in their work leading to the degree of doctor of medicine.

Rush Medical College, of the University of Chicago, Chicago, Ill., offers in the senior year a 48-hour clinical and conference course, limited to 10 students, dealing with the human maintenance department in the industries, including preventive medicine. Another course, covering dangerous trades, industrial health hazards, and occupational diseases, and to which sociological as well as medical students are admitted, is given in the department of hygiene and bacteriology. Both courses are elective, but when taken they count on the requirements for the degree of doctor of medicine. Clinical work is offered in connection with the evening clinic in the Central Free Dispensary, located in the heart of the industrial region of Chicago. The college hopes, in the near future, to elaborate these courses in connection with the post-graduate school which is contemplated by the University of Chicago.

Ohio State University College of Medicine, Columbus, Ohio, offers, in its department of public health and sanitation, elective courses in industrial hygiene and preventive medicine to undergraduate medical students. The courses in industrial hygiene were established in 1915. During the war, however, only an elective course in personal hygiene for freshmen students and a prescribed course in preventive medicine for senior students were given, and for 1919-20 too few students registered to warrant giving any of the other courses.

While the university gives no curriculum termed "industrial medicine," students in the graduate school have been permitted to specialize in industrial hygiene and preventive medicine. These courses also were dropped at the beginning of the war, but during 1919-20 a few students, candidates for the degree of master of science, are specializing in industrial hygiene.

With the opening of the session of 1919-20, in order to meet the demand for health commissioners in the State of Ohio, an extension course, in which industrial medicine was stressed, open to graduate physicians only, was substituted for the first two and a half months of the published graduate courses. This course was given in cooperation with the Ohio State department of health and included among its faculty members of the department.

In addition to these courses, the department of public health and sanitation gives minor courses, elective in nature, in personal hygiene, public health problems, industrial hygiene, and public health administration, to undergraduate students in the colleges of arts, philosophy, and science, education, and commerce and journalism.

University and Bellevue Hospital Medical College, New York City, includes in its regular work a course of 11 hours in industrial hygiene and occupational diseases, comprising seven didactic lectures and four quizzes, in which industrial environment and occupational diseases are discussed.

Columbia University College of Physicians and Surgeons, New York City, devotes one hour to industrial hygiene in its course leading to the medical degree. This subject was introduced in the session of 1918-19 as part of the public health course.

Johns Hopkins Medical School, Baltimore, Md., while giving no specific course in industrial hygiene, considers many of the problems involved in the subject in courses upon general medicine, surgery, and hygiene.

Detroit College of Medicine and Surgery, Detroit, Mich., has, for the session of 1919-20, added the subject to its regular course for medical students.

The University of Michigan Medical School, Ann Arbor, Mich., includes the subjects of industrial hygiene and occupational diseases in a course of lectures in hygiene.

Northwestern University Medical School, Chicago, Ill., gives a course of lectures on public health, which includes industrial medicine, to its fourth-year students.

Washington University College of Medicine, St. Louis, Mo., has recently introduced a course of 11 lectures on social medicine, in which a number of industrial problems are discussed by men who have had special experience. Clinical work is afforded by the industrial clinic in the out-patient department of the school.

Courses in Public Health.

A number of institutions offer work in industrial hygiene as part of their post-graduate courses in public health.

The University of Pennsylvania, Philadelphia, Pa., is placing considerable emphasis upon a course in industrial medicine and hygiene which is incorporated with the course in public health leading to the degree of doctor of public hygiene. The course includes visits to representative industrial plants, and service in connection with the first-aid stations and emergency hospitals in some of the larger plants. Clinical advantages are afforded by the occupational disease clinic of the university hospital.

Yale University, New Haven, Conn., while it offers no special degree in industrial hygiene, offers two degrees, a certificate and a doctorate, in public health, and some of the students working for these degrees specialize in industrial hygiene, including a course in industrial diseases. Those who so desire do special research work along industrial lines. The university, in conjunction with the

United States Public Health Service, has an experimental laboratory for the study of factory ventilation and the industrial dust hazard.

Syracuse University, Syracuse, N. Y., the *University of Illinois*, Urbana, Ill., and other institutions devote some measure of attention to industrial hygiene in connection with public health courses.

The following institutions offer courses leading to one or more of the four degrees in public health—doctor of public health, doctor of philosophy or doctor of science in public health, certificate in public health, and bachelor of science in public health or hygiene: The University of California, Berkeley, Calif.; Johns Hopkins Medical School, Baltimore, Md.; Harvard University Medical School, Boston, Mass.; Detroit College of Medicine and Surgery, Detroit, Mich.; the University of Michigan Medical School, Ann Arbor, Mich.; University and Bellevue Hospital Medical College, New York City; the University of Pennsylvania, Philadelphia, Pa.; the University of Wisconsin, Madison, Wis.; Ohio State University, Columbus, Ohio; Yale University School of Medicine, New Haven, Conn.; Chicago Hospital College of Medicine,¹ Chicago, Ill.; Tulane University of Louisiana,¹ New Orleans, La.; Union University,¹ Albany Medical College, Albany, N. Y.; and University of Colorado,¹ Boulder, Colo. The standardization of the courses leading to the four degrees has been the subject of considerable discussion. Representatives of several universities met at Yale in February, 1919, to consider the subject, and resolutions leading to such standardization were passed. It may reasonably be expected that, when secured, such standardization will involve the placing of some measure of emphasis upon the subject of industrial hygiene.

Related Courses.

The Phipps Institute, Philadelphia, Pa., and a few other institutions have carried on special research work in subjects pertaining to industrial hygiene.

The *Chicago School of Civics and Philanthropy*, Chicago, Ill., in cooperation with public health agencies of Chicago; *Simmons College*, Boston, Mass., in connection with the Instructive Nursing Association; and *New York University*, New York City, are prominent among institutions now offering industrial nursing as a course of study.

New York University, School of Commerce, Accounts, and Finance, offers in the second semester, February to June, 1920, a course in standardization of nursing service in industry, especially arranged for industrial nurses, welfare workers, and those intending to enter the field of industrial welfare work. The course includes lectures and group discussions of industrial nursing methods, first-aid equipment,

¹ Included in list given by Eugene C. Howe, in *American Journal of Public Health*, Chicago, August, 1918, pp. 600-607.

and preventive work in industrial plants. The class meets once a week for 15 consecutive weeks.

Smith College School for Social Work, Northampton, Mass., plans to establish permanently courses in psychiatric social work, medical social work, child welfare, and community service. The plan is the outcome of a successful experiment, tried in the summer of 1919, in training a group of social workers for the purpose of aiding in the reeducation and treatment of soldiers suffering from war neuroses and psychoses. The course embraced two months of didactic work at Smith College, followed by six months of practical work at various mental hospitals and clinics, which afforded a continuation of psychiatric instruction. Forty students completed the course and are holding positions as psychiatric social workers. This type of worker gives promise of meeting a special need, that of a medium between the psychiatrist and the homes of the community, in which maladjustments and incipient mental diseases are seldom brought to the knowledge of the physician.

The *Philadelphia School for Social Service*, Philadelphia, Pa.; the *New York School of Philanthropy*, New York City; the *Chicago School of Civics and Philanthropy*, Chicago, Ill.; and *Simmons College* and the *Boston School of Social Work*, Boston, Mass., offer somewhat similar courses.

The *Missouri Association for Occupational Therapy*, St. Louis, Mo., deals with various problems in which medicine and industry touch, and is prepared to make surveys of hospitals, sanitariums, and such institutions, to outline for them a system for installing an occupational department, and to furnish them with trained teachers. It maintains an occupational department in the city hospital, the city sanitarium, Barnes Hospital, and, in cooperation with the city board of health and the board of religious organizations, in the Girls' Detention Hospital.

The course of instruction offered by the association consists of seven months' training, which includes three months of practice work in hospitals. A certificate is given upon completion of the work. The class is limited to 15 members.

Public Industrial Clinics.

THE history of industrial clinics open to the public is a brief one. The first clinic of this nature in this country was established by Dr. W. Gilman Thompson in his department at the Cornell University Medical College, New York City, about 1907, but this clinic has since been discontinued. Besides several industrial clinics of widely distinct types which have abundantly proved their worth during the last few years, a number of more or less specialized clinics,

under both public and private auspices, are now doing or planning to do work along various lines of industrial medicine.

The Clinic for Functional Reeducation of Disabled Soldiers, Sailors and Civilians, New York City, was established by Dr. Thompson in February, 1918, as a war service, but it has from the first dealt with civilian as well as military cripples. The first patient was received July 15, 1918, and during the first year of the clinic's work 1,150 cases were treated, about 50 per cent of them coming from military and the other 50 per cent from civilian sources. The clinic now averages 100 treatments a day and has been forced to open night classes.

Cases have been referred to the clinic from various branches of the Federal Government, accident insurance companies, the Red Cross, railroad corporations, and industrial corporations. Private patients also are treated.

The clinic conducts departments of hydrotherapy, electrotherapy, thermotherapy, and massage, a social service department, and a department of occupational therapy.

With the exception of the clinic described, industrial clinics may be divided into three classes, according to whether they are operated in connection with (1) public hospitals, (2) medical colleges, or (3) State or municipal departments of health or of labor. In many cases cooperation between two of these in the use of the clinic is very close, as is instanced in the clinic of the Massachusetts General Hospital, which serves both the hospital and the Harvard Medical School. There are also a few other types of clinics which come under none of these classes. The work of the United States Public Health Service and clinics in industrial plants will not be here considered.

Clinics Connected with Public Hospitals and Medical Colleges.

The Occupational Disease Clinic of the Massachusetts General Hospital, Boston, Mass., was opened in March, 1916. A sketch of its work was published in the MONTHLY REVIEW for December, 1917 (pp. 185-193).

The total number of industrial diseases diagnosed at the clinic from February, 1919, to December, 1919, was 270. During this time more than 1,140 patients received attention, including 30 cases of various kinds of industrial poisoning, distributed as follows: Lead, 22 cases; anilin, 1 case; gasoline, 1 case; methyl alcohol, 1 case; trinitrotoluol, 1 case; benzol, 1 case; and 3 ill-defined cases. There were 13 cases of tuberculosis believed to be of occupational origin; 10 cases of occupational neurosis; 9 of trade eczema; and 32 of occupational strain.

The clinic is at present tabulating, according to age, sex, industry, and disease, the 30,000 new cases admitted to the out-patient depart-

ment of the hospital during 1919. Beginning with January, 1920, by means of a punch-card system, data relating to the incidence of disease in various industries and occupations will be constantly collected and made readily available.

The Hospital of the University of Pennsylvania, Philadelphia, Pa., organized an occupational disease clinic in 1914, the plan being to conduct it as a center for consultation and investigation, rather than as a place for treatment of numerous cases of varied character. Investigations of industrial problems so far undertaken embrace hygienic conditions in the cigar-making industry and among tobacco makers generally; pulmonary disease in potters and cement workers; conditions surrounding the employment of women in textile trades; and comparative investigations of dust within and outside industrial plants. Psychiatric cases are referred to the psychopathic clinic of the Department of Psychology of the university.

The Cincinnati General Hospital, Cincinnati, Ohio, is planning to open an occupational disease clinic by the fall of 1920 for the purpose of meeting the teaching requirements of clinical science which can not be fully met by the clinics in the industrial plants to which the college now has full access. In this clinic all the services of the hospital—including medicine, surgery, dermatology, ophthalmology, neurology, and pathology—will participate.

The Delray Industrial Hospital, Detroit, Mich., although originally founded by a commercial company for the use of its own employees, has now so far extended its scope that it may be considered an institution for the public. Primarily the object of the hospital has been to create an industrial institution, the scope of which would be limited to the handling of industrial accidents and diseases, but, owing to the lack of hospital facilities in general, and particularly in that portion of the city, it has been compelled to serve the community as well.

This hospital was organized as the Solvay General Hospital, Detroit, Mich., some 15 years ago by the Solvay Process Co. for the care of its injured employees. As it gradually expanded other firms and the local physicians were allowed to take advantage of it. It was reorganized in 1917 as a corporation under its present name.

There is a dispensary which serves as an out-patient department of the hospital and is responsible for all ambulatory sick cases, minor accidents, and physical examinations of the men when they are engaged for work. Whenever the case is serious enough to warrant it, a patient is referred to the hospital, where a thorough diagnosis, including X-ray and laboratory findings, can be made.

The report for 1918 shows that during the year there were 4,801 treatments in the out-patient department, including physical examinations, and 32,418 treatments in the dispensary, including physical examinations.

The following table shows the nature of the diseases treated:

MEDICAL AND SURGICAL CASES TREATED IN THE DELRAY INDUSTRIAL HOSPITAL DURING THE YEAR 1918.

Nature of case.	Medical.	Surgical.	Nature of case.	Medical.	Surgical.

The American Hospital, Chicago, Ill.,² has established an industrial department, and a special equipment for handling casualty cases is planned.

Rush Medical College Occupational Disease Clinic, Chicago, Ill., was the first established in the Middle West. It was founded by the Sprague Memorial Institute of Chicago University in July, 1911. After several changes, it was reestablished as an evening clinic at Rush Medical College.

Ohio State University Medical College Occupational Disease Clinic, Columbus, Ohio, the next industrial clinic in that section of the country, was established in 1915.

Washington University School of Medicine, St. Louis, Mo., holds each week an industrial clinic in its out-patient department. The placement officer of the bureau for the placement of the physically handicapped, conducted by the Red Cross, cooperates with the school physicians as regards the industrial problems and placement of patients attending the clinic. Attached to the dispensary is a workshop in which handicapped patients can be put to work under observation and their working capacity determined. The types of cases seen in the industrial clinic and the workshop are nervous, orthopedic, cardiac, and a few tuberculous cases.

Clinics Connected with State or Municipal Departments.

The Occupational Disease Clinic of the New York City Department of Health is a feature of the work in industrial hygiene which was organized in 1915. It is described in an article in the MONTHLY LABOR REVIEW for September, 1919 (pp. 298-300).

² *Modern Hospital*, Chicago, January, 1920, p. 60.

The Rehabilitation Clinic of the New Jersey Rehabilitation Commission, at Newark, N. J., under the State Department of Labor, promises to become an interesting development in this line of clinics. The clinic is to be fitted with the best appointments for orthopedic treatment, and the work of rehabilitation of those disqualified in industry completed by their reeducation, when necessary, and placement in employment.

The Newark Antituberculosis League, in cooperation with the State Department of Labor, has announced a plan for the institution of a night pay clinic for the diagnosis of industrial diseases.

The Ohio State Department of Health has a very active division of industrial hygiene, which, although it does not maintain a clinic, includes in its work the investigation of occupational disease complaints, by field work when required, gives advice to industrial plants, employees, or the industrial commission, and also does special research work and investigations.

Similar work of more or less extended scope is being carried on by other States and by local authorities.

Clinic for Workers in the Cloak and Suit Industry.

The Board of Sanitary Control of the Cloak and Suit Industry, New York City, has established a clinic for workers in that industry which may be considered as standing midway between the public clinic and the plant clinic or dispensary. It is supported by joint contributions from employers and employees.

Related Work.

Other institutions as well as individual workers are doing work of more or less value along the line of industrial medical research and treatment. Many clinics established for the treatment of special classes of diseases have a very close relation to some phases of industrial medicine, notably the Cardiac Clinic which was started at the Central Free Dispensary, Chicago,³ in 1918, and reestablished in March, 1919. Patients are referred to it from a number of different organizations, and much placement work is done through the Henry Favill School of Occupation. A vocational department in connection with this clinic is being discussed.

Medical Students and Industrial Medicine.

SUCH are the facilities which may be considered representative of the best that is offered for the study of industrial medicine and the training of industrial physicians in the United States. A few educational institutions besides those mentioned offer work which

³ The Cardiac Clinic of the Central Free Dispensary of Chicago, by Leo L. J. Hardt and Helen Beckley, in *Journal of the American Medical Association*, Chicago, Dec. 6, 1919, pp. 1792, 1793.

approximates the minimum afforded by the ones named. Still others are planning more extended work along this line than has so far been attempted by them, but are not ready to make their plans public. Even among those mentioned, however, very few are giving any but the most general attention to the subject. Only a small proportion of the clinics or hospitals specializing on the treatment of industrial accidents and diseases are making a special study of diseases in their relation to occupational conditions.

That this apparent ignoring of the importance of industrial medicine is not due to any lack of public interest in general health conditions is argued by the multiplication in all parts of the country of clinics, dispensaries, and other means for safeguarding the public health and teaching general hygiene. Indeed, the country seems to be thoroughly aroused to the importance of conserving the public health, and partly awakened to a realization of the predominant rôle which preventive medicine must play in such work. But the extent to which preventive medicine is bound up with the conditions under which the workers do their work, the action of such conditions upon the physical and mental health of the workers, and the consequent reaction of the workers thus affected upon the community have apparently not yet made any strong appeal to the imagination or the sympathy of the public. The subject has not even made a claim, in any proportion to its importance, upon the attention of the medical profession.

The most plausible explanation of this latter fact lies in the slight encouragement which, in the past, has been given by educational authorities for the study of this branch of medicine. For no matter what degree of public or of other interest may be enlisted in the subject, the burden of practical accomplishment in industrial medicine rests with the medical profession. This view is stressed by authorities in the matter in replies received to the letters sent out by the Bureau. Dr. Emery R. Hayhurst, of the Ohio State University, says that the work included under the "rather new term 'industrial medicine'" does not seem to be attractive enough to the recent graduate medical students, and adds:

Our graduates [who have received the medical degree] seem all bound up with the idea of taking a year or two hospital work, and after that going into private practice. It has so far seemed impossible to instill the ideas of "mass" medicine in our medical [post-graduate] students. On the other hand, our university students [sociological and other nonmedical students] seem overenthusiastic about the whole concept of "mass" medicine, hygiene, and public health.

Nor are the undergraduate medical students, in his opinion, attracted to the subject, as evidenced by the fact that none are taking the elective courses offered by the university. Additional evidence of this apathy toward the subject on the part of medical students

is afforded by the failure of any students to enroll for the full course in industrial medicine offered this year by the University of Cincinnati, and by the small number of medical students enrolled in any of the elective courses in the subject offered by other institutions.

In this connection Dr. Hayhurst says:

This seems to be due to the fact that the curriculum specified by the Council on Medical Education of the American Medical Association, which is the standard for A-class medical colleges (to which some 78 of the existing 87 medical colleges in the country belong), is so filled with prescribed work as to allow little opportunity for undergraduate medical students to carry any electives. There is some question in my mind whether, in view of the socialization of medicine, the character of the prescribed work should not be modified by the Council on Medical Education so as to admit proportional training in medical sociology, medical economics, "mass" medicine, etc.

The result of the neglect of the subject by medical students is that industries are employing persons for industrial medical service who, it is said by industrial medical specialists, are not trained or especially qualified for the work, and who in consequence bring discredit upon such service. Dr. Hayhurst thinks the most urgent feature of the situation at present is that of ways and means of arousing the interest of educational institutions in the subject, and he suggests, as a possible help in meeting the demands of the time for industrial physicians, the establishment of scholarships and fellowships in industrial medicine so as to encourage medical students to enter this field.

Now that a few of the more prominent medical schools are offering special courses in industrial medicine, and others are providing better facilities than formerly for training physicians along this line, there is ground for hope that a new interest may soon replace the apathy which has been displayed towards "mass" medicine by medical students. This hope gains its strongest force from the demand which is growing for the employment of well-equipped and socially minded men as physicians in industrial plants.

Protection of Sand Blasters Against the Dust Hazard.

THAT a type of installation has been found which is adequate to safeguard the worker in a sand-blasting cabinet against the dust hazard incident to his employment is the belief expressed by Dr. C.-E. A. Winslow and others in the report of an investigation conducted by them for the United States Public Health Service and described in Public Health Reports for March 5, 1920 (pp. 518-534).

The investigation was made in connection with problems that had arisen in the sand-blasting department of a large automobile factory in Connecticut, and the Palmer water-spray apparatus which the authors had found satisfactory in previous investigations was used. The immediate object of the investigation was "to determine the efficacy of the respirator and helmet used in the plant under observation, and if it was found, as was to be expected, inadequate, to determine the modifications in construction or operation necessary to secure a satisfactory degree of protection."

The dust problem in sand blasting is first discussed as follows:

In most industrial plants the protection of the worker against the hazard of industrial dusts can be best accomplished by keeping the dust content of the air of the workroom itself down to a reasonable level. The control of the dust in the workroom air is effected, in such cases, either by substituting wet processes for dry grinding procedures and the like, by carrying on dust-producing operations in inclosed spaces, or by equipping such devices as emery wheels and buffing wheels with exhaust hoods and suction fans. The success which may be attained by the last of these three means was discussed in a paper published in Public Health Reports for March 7, 1919 (pp. 427-449).

In other industrial processes, as in certain packing operations, in marble and granite working, and in the sand blasting of large castings, it is impossible to render the general air of the work place sufficiently free from dust to avoid danger of injury to the respiratory tract of the worker. In such cases as this, protection against the dust hazard can only be attained by the wearing of helmets, masks, or respirators, which will either filter out the dust particles from the air before it is drawn into the respiratory tract, or exclude the surrounding air more or less completely from the nose and mouth and supply pure air for breathing from some other source. It is difficult to accomplish these ends without interfering seriously with the comfort of the person wearing the helmet or respirator. A large number of devices designed to protect the worker against dust are on the market, but the discomfort produced in practice prevents the use of many of them; while those of simpler construction, which are less objectionable to the worker, are frequently of more than doubtful efficiency.

It seems essential as a prerequisite for the standardization of protective measures in this field to determine first what results may be actually accomplished in the way of dust control by different types of masks, helmets, and respirators, and then to weigh carefully the efficiency of each piece of apparatus as balanced against the discomfort which may reasonably be expected to militate against its actual use.

The report then considers briefly the previous studies made of the efficiency of helmets and respirators designed for the protection of the workers in dusty trades, describes in detail the installation and methods employed in the present study and the results of the present study, and gives a summary and practical conclusions in regard to the protection of sand-blast operators.

Recommendations.

IN CONCLUSION the report recommends that where the nature of the operation is such as to require the presence of workers within the sand-blasting cabinets of the types studied, all such

workers should be protected by helmets provided with positive air pressure and with respirators of the general type described. It is believed that under such conditions substantially complete protection will be secured.

In regard to the amount of air to be supplied to the helmet in practice the report states that in the tests on the average somewhat less than 3 cubic feet per minute were used, while the Palmer apparatus was constantly removing 2 cubic feet per minute. "In other words, the pressure at the front window of the helmet was produced by an excess of air supply over air exhaust through the Palmer apparatus of less than 1 cubic foot per minute." This suggested that in practice it would only be necessary to maintain a corresponding excess of air supply over the amount withdrawn from the helmet during inspiration.

Assuming that for the type of physical effort required in sand blasting each inspiration removes 90 cubic inches of air in a period of 1.5 seconds the draft upon the air in the helmet, during the inspiration period, would be at the rate of approximately 2 cubic feet per minute. A gross air supply to the helmet of 2.5 to 3 cubic feet per minute should therefore prove ample to maintain satisfactory conditions in practice.

The solution of the odor problem appears to have proved comparatively simple. It was found that only when large quantities of air were allowed to enter the helmet was the odor of oil noticeable, and that with the air supply to the helmet reduced to 3 cubic feet per minute it was impossible to detect any odor in the air supplied. If trouble of this kind should be experienced, the report adds, there are on the market simple and inexpensive air filters which may be placed in the air line to remove any impurities present. An experiment was made with one such filtering device, and it was found that the helmet supplied with air passed through this filter could be worn for over half an hour without the slightest inconvenience due to odor. It is stated that on actual test an amount of oil which would equal two or three drops collected in the filter during such a period. In order to avoid possible complaints the inclusion of such a filter in the air would seem to be desirable. The use of a small impeller type blower, which does not use lubricating oil internally for the fresh-air supply, would, of course, solve this difficulty completely, according to the report.

The introduction of $2\frac{1}{2}$ to 3 cubic feet of air per minute through a $\frac{1}{4}$ -inch hole at the top of the helmet would produce an uncomfortable draft on the top of the uncovered head, particularly in cold weather. The operators in using the apparatus as recommended by us wore their caps and in testing it ourselves we placed a folded handkerchief on the top of the head. It would seem desirable, however, to construct the helmet with a deflector plate under the air inlet so as to distribute the air more evenly and avoid the necessity for other protection. It would also be well to provide an air chamber equipped with a small heating coil to temper the incoming air in cold weather.

Finally, there are a few minor points in construction which will contribute materially to the success of such protective devices as those described. The tubing connecting the air line to the helmet should be of light weight so as to avoid a drag on the head of the operator, and it should be connected to the supply pipe overhead and near the center of the chamber so that its length may be as short as possible. We would recommend that about 2 feet of the tubing should be permanently connected to the helmet and equipped with a connecting joint (which might be merely a 2-inch section of brass tubing) so that the worker could enter the chamber fully equipped and make his air-line connection without removing his helmet. It would seem advisable to provide no air valve within reach of the worker, but to keep the air control under the supervision of the foreman. The air valve should be set to deliver 2.5 to 3.0 cubic feet of air per minute, and this air supply should be continuously maintained during working hours. The additional cost required to maintain a continuous air supply would be a minor item compared with the danger arising should individual workers fail to turn on the air supply.

INDUSTRIAL ACCIDENTS.

Hours of Work as Related to Output and Accident Rate.

IN 1917, when the question of output was of paramount importance, the Public Health Service, in conjunction with the committee on industrial fatigue of the Council of National Defense, and the committee on fatigue in industrial pursuits of the National Research Council, began an investigation of the effects of certain industrial conditions on output, especially the influence of fatigue, as shown by the relative production under different working hours when other conditions were reasonably similar. The close of the war did away with the particular motive which had led to the undertaking, but did not diminish in the least the need for information as to the effect, both on output and on worker, of different conditions of employment, so the investigation was continued and enlarged. The first report of its findings, giving the conclusions reached as to output and incidence of accidents under different schedules of hours, together with some related factors, is about to appear.¹ The scope of the work is shown in the following paragraph:

"The present report deals primarily with the study of two objective tests of working capacity among factory employees, working under normal factory conditions, namely, the variations in actual hourly output and the variations in hourly incidence of accidents in two factories working, respectively, under an 8-hour and 10-hour schedule. The difference in work at these two plants is further illustrated by a study of time lost at each factory, as shown by direct observation and by records of power consumption. An examination of labor turnover by departments at both plants furnishes statistical evidence of the relation of physical environment to the stability of the labor force. A study of recesses shows their effect on production. A preliminary statement of extended researches into the phenomenon of rhythm in industrial work now being carried on by Dr. P. S. Florence and Dr. A. H. Ryan closes the report."

The two plants chosen for investigation were engaged, one in the manufacture of munitions, the other in the manufacture of automobiles. The munition plant worked two shifts, the day shift being

¹ Treasury Department, United States Public Health Service. Studies in industrial fatigue: Fatigue in relation to working capacity. Comparison of an eight-hour plant and a ten-hour plant. Report by Josephine Goldmark and Mary D. Hopkins on an investigation by Philip Sargent Florence. Public Health Bulletin No. 106, February, 1920.

on duty from 7 a. m. to 12, and from 1 to 6 p. m., while the night shift worked full 12 hours, from 6.20 p. m. to 6.40 a. m., with a break of 20 minutes at midnight. The other plant worked three shifts of 8 hours each. Comparisons were made only for the day shifts, since in the 8-hour plant only 8 per cent of the force were in the night shift, and there were other differences which made it difficult to compare results fairly. In each plant certain repetitive processes, comparable with those selected in the other, and giving an output which could be counted or measured during the period of observation, were chosen, and repeated records were made of the output in each. For each process an average output for each hour of the working day was obtained, based on many single observations of each individual worker, and of many different workers, in order to obtain a result which should not be affected by the chance variations which might appear in the case of a single worker. This average having been secured, the maximum hourly production for each process was taken as the norm for that process, and the output of the other hours was expressed as a percentage of this. This method, which differs from the customary method of using the average hourly output as the norm, is defended on the following grounds:

Absolute output at the two plants can plainly not be compared. Different workers are employed; the processes, though comparable, are not the same; the product is diverse. Even the deviations from the average output at the two plants can not fairly be compared, as may be readily shown. In such an average the drop of a single hour, if great, may lower the general level so far as to make it wholly unrepresentative of the entire day's work, and thus prevent us from comparing the deviations hour by hour with similar deviations from a more representative average. This is the case at the 10-hour plant, where the depression of the average by the deep drop of the final hour to 80 invalidates a comparison of the hourly deviations with the wholly representative average of the 8-hour plant, which is based on hourly figures varying within narrow limits and a last hour falling only to 95.5.

Production Curves in Different Types of Operations.

THE output curve in general begins at something under its full height, works up within the second or third hour to a peak, and then declines, the last hour showing a considerable fall. The second spell of work follows the same general outline, though on a lower level. The operations studied were divided into four types—dexterous handwork, muscular handwork, lathe machine work, and miscellaneous machine work. These showed some interesting variations in their output curves. In both plants the dexterous handwork processes showed a pronounced tendency to reach their maximum output in the third hour; apparently a considerable amount of practice was required to get the workers into their full swing. After the lunch interval practice was again required to bring up the workers' efficiency, but by the second hour this was

accomplished, and in the 8-hour plant production then continued high until the last hour, when the customary drop occurred. In the 10-hour plant the afternoon level was relatively lower than in the 8-hour, and the drop of the final hour was far more pronounced.

The curve of output in the muscular handwork processes reaches its maximum earlier than is the case with the dexterous processes, and the fall begins sooner, and is more marked throughout the day than is the case with any other type. As the main requirement in this work is physical strength, fatigue shows itself more plainly than in types where dexterity is required, and the heavier the process the more marked is the effect of fatigue, as shown by the fall in output. The output of the first hour after lunch is in general larger than that of the second, showing the effect of the rest, the output not being affected by the loss in practice shown by the dexterous types. The afternoon fall is much greater and begins earlier than in the other types.

The curves of the two types of machine work differ from each other, but both are marked by a singular maintenance of output through the second spell of work, and a relatively slight decrease in the last hour. In one operation the output of the last hour is actually the highest of the day. It is pointed out that this does not necessarily mean that fatigue has not developed. In the case of the miscellaneous machine processes the output is governed to a large extent by the machine, and the fatigue of the operator has little effect on it. In the case of the lathe machine operations, the theory is put forth that fatigue is masked by the rhythmic nature of the work.

Comparative Output of the Two Plants.

IN EACH of the separate types of work the 8-hour plant showed a greater steadiness of production than the 10-hour, but to see how far this might be true for total output, the four types were combined, care being taken to eliminate operations which were not strictly comparable. Since in each type of work, and in each operation within the type, the hour of maximum production might vary from that of the next operation or type, the combination naturally does not show an index figure of 100 for any one hour. For the two plants the index figures of production are as follows:

INDEX NUMBERS OF HOURLY OUTPUT OF TWO PLANTS, SHOWING FALL FROM MAXIMUM.

Spell.	8-hour plant.				10-hour plant.				
	First hour.	Second hour.	Third hour.	Fourth hour.	First hour.	Second hour.	Third hour.	Fourth hour.	Fifth hour.
Morning spell.....	89.6	96.4	97.4	94.4	82.7	93.8	95.6	97.2	90.4
Afternoon spell.....	95.7	94.4	94.2	89.8	90.1	91.6	91.1	90.7	79.1

The disparity between the two sets of figures is striking. The lowest hourly output of the 8-hour plant differs by less than 10 point from the highest, while for the 10-hour plant the variation is not far from 20 points. The difference is noticeable not only in the first and last hour of each spell of work, but in the lower level of the entire second spell in the 10-hour plant. Summing up the situation, the authors declare that the outstanding feature of the 8-hour system is steady maintenance of output, while the outstanding feature of the 10-hour system is the decline of output.

Relation between Fatigue and Industrial Accidents.

THE report takes up, in considerable detail, the theories advanced to account for the customary accident curve. In this, accidents are uniformly low in the first hour of the working spell. They then rise gradually to a peak, most frequently in the penultimate hour of the spell, from which they gradually decline. In the second spell there is a generally similar rise and fall, often at a somewhat lower level. Speed of operation is admitted as an important cause of accidents, the exposure to risk increasing as the number of operations per hour or per minute rises. Fatigue has been advanced as an additional and important cause, but this theory has been attacked on the ground that in the final hours of the working spell, when fatigue should be at its height, the accident curve is falling. In this study, after making careful allowance for such items as lost time, change in work, and the like, which might interfere with the normal incidence of accidents, an index figure is worked out, showing the hourly accident rate per unit of output. This presents a striking contrast to the customary accident curve, for although in the latter hours of the spell or the day the accident rate declines, yet the rate per unit of production shows an increase. The main conclusions reached in this study of accidents are as follows:

- (a) In the absence of fatigue, accidents vary directly with speed of production, owing to increased exposure to risk.
- (b) The breaking up of this regular variation by fatigue is indicated by—
 - (1) The rise of accidents with the fall of output.
 - (2) The disproportionate rise of accidents with the rise of output, and the lack of a proportionate fall of accidents with the fall of output in the final hours of the day.
- (c) The importance of fatigue in the causation of accidents is emphasized by the fact that the higher accident risk accompanies the deeper decline of working capacity—
 - (1) In the second spell as compared with the first.
 - (2) In muscular work as compared with dexterous and machine work.
 - (3) At the 10-hour plant as compared with the 8-hour plant.
- (d) The level of the accident rate varies with the inexperience of the workers.

Other Factors Affecting Production.

IN BOTH plants a study was made of such matters as the amount of lost time, limitation upon output, and the like, which would affect output. The difference between the two in the matter of lost time was striking, being very evident in respect to time lost in beginning and ending work. This was checked up by a study of power consumption with the following results:

At the 8-hour plant 90 per cent of average power was maintained until 6 minutes, on the average, before the close of work; at the 10-hour plant more than 21.5 minutes before the close of work the percentage of average power had dropped below 90. In other words, work continued at the 8-hour plant practically under full power until 6 minutes before the end of the shift; at the other factory power began to decline three and one-half times as long before closing time—at exactly 5.30 p. m., when the investigators began afternoon readings, only 87 per cent of average power was in use in the entire building.

An investigation of time lost during the day showed even more striking differences. In both cases the workers were paid by the piece, so that voluntary loss of time was at their own cost. At the 8-hour plant, in two out of three operations studied, no time whatever was noted as voluntarily lost, and in the third, a particularly heavy and taxing operation, the voluntary loss was only $7\frac{1}{2}$ minutes. In the 10-hour plant in five operations studied the time lost voluntarily was, respectively, 5, 10, 30, 41, and 42 minutes. There was an evident relation between voluntary and involuntary loss of time; as the latter rose the former fell.

In each plant a certain amount of time was lost through faults of management, but apart from this there was a manifest tendency for the workers in the 8-hour plant to work to capacity, while in the 10-hour plant there was as manifest a tendency to work below capacity.

Another point of difference between the two plants was the prevalence of a limitation on output at the 10-hour plant. The investigators found that in many of the operations there seemed to be a tacit acceptance of some fixed quantity as a suitable output for the day, and this was rarely exceeded. If, however, some accidental delay or interruption made it likely that the worker, producing at his accustomed rate, would not reach this quantity, he could and did work at a very much faster rate until he felt assured of his output. It is not suggested that this spurt could have been maintained throughout the day, but there was considerable ground for believing that the actual output was decidedly below the potential output. At the 8-hour plant there was little, if any, evidence of this stereotyping of output.

This restriction of output can not be attributed to union practice, for the 10-hour plant has only a few union workers, nor can it be

attributed solely to faults of management. In part, it is thought, it may be due to the fear of the workers that if they exceed the customary output to any extent piece rates will be cut, so that they will have to work harder for the same or a smaller return. But this is not the most important reason.

The fundamental cause for limitation of output, however, lies deeper. No group of workers could continue, without physical disaster, to work at full capacity for a stretch of 12 hours at night or 10 hours in the daytime, not to mention the 3 hours overtime irregularly worked at the 10-hour plant. Low speed, wasted time, limited output are in large part the workers' automatic defense against exhaustion, against the overstrain of excessive hours of labor.

No attempt was made to compare the output of the night shift in the two plants, but a study was made of conditions and production of the night shift in the 10-hour plant. The most striking features were the sharp drop in production during the last two hours and the progressive slowing down, as the night wore on, in rate of production, as shown by the time required for a single operation. The voluntary loss of time due to sleeping, resting, eating, and so on was also noticeable.

The study of labor turnover led to the conclusion that it is directly associated with distasteful working conditions—such as long hours, low wages, and undesirable working conditions—and that it may be lowered by systematic effort to improve conditions and to fit workers to their jobs.

The report closes with a preliminary discussion of rhythm in industry, a topic which, it is explained, will be treated more fully in a future report.

WORKMEN'S COMPENSATION.

Recent Reports on Operation of Workmen's Compensation Laws.

Federal Employees' Compensation Commission.¹

THE third annual report of the commission charged with the administration of the law granting compensation to civil employees of the United States consists of two parts, the first statistical, covering the first 95 pages, and the second, decisions of the commission, pages 97 to 185. The act went into effect September 7, 1916, and the present report presents data through October, 1919, a period of 38 months. During that time final awards have been made in 29,772 cases, of which 613 were deaths, 18 permanent total disabilities, and 885 permanent partial disabilities. The number of claims received during the same period was 30,981, which was just about one-half of the number of the injuries reported (61,628). The number of compensable injuries as compared with the number reported is obviously much greater than under the average State law, and this may be explained in large part by the fact that compensation is payable for disabilities of over three days' duration. This appears from the report as to period of disability for 28,256 cases of temporary total disabilities reported, of which 5,401 caused disability of from 1 to 3 days; 6,718 from 4 to 7 days; and 6,267 from 8 to 14 days. Under this act only the first number, or 19.1 per cent of the total, would be eliminated, while under a law allowing a 7 days' waiting time 42.9 per cent would be excluded; a 2 weeks' waiting time, still found in many States, would eliminate 65.1 per cent.

One point which receives considerable attention in the report is the relation between compensation and the wages lost. The statute allows two-thirds of the wages as benefits, no wage in excess of \$100 per month to be considered. This limits the amount of compensation possible to \$66.67 per month as a maximum. The recent great advance in cost of living, and the rising wage rate in industrial employments, as in the arsenals and navy yards, make a wide gap between the income of the worker and his benefits during disability. Thus it was found that for temporary total disabilities but 44.1 per cent of the wage loss was paid in compensation, while for per-

¹ Third annual report of the United States Employees' Compensation Commission, July 1, 1918, to June 30, 1919. Washington, 1919. 185 pp.

manent partial disabilities the percentage is 58.8, making for all classes of disabilities 45.5 per cent of the wage loss repaid in compensation. It was recommended therefore that the law be amended so that compensation would be based on a maximum of \$150 per month and a minimum of \$75, thus permitting benefits ranging from \$50 to \$100, instead of from \$33.33 to \$66.67 as at present.

The number of injuries and duration of disability for tabulatable accidents, and awards for compensated cases, are shown separately for each department and important bureau or establishment. The number of cases of temporary total disability for the period of the existence of the law amounts to 28,256, with a total duration of 475,584 days, or an average of 17 days per case. The number of these cases compensated amounted to 15,374, awards for the same making a total of \$615,912, or an average of \$40.06 per case. A certain amount of annual leave is available to most employees, during which wages are continued. The amount of leave taken in compensated cases was 12,994 days, and disability absence of 366,061 days was involved in addition. In 2,798 cases no compensation was called for because the absence was covered by leave, while in 4,720 cases no claims were filed; 5,401 cases were of not over 3 days' duration.

The cost of medical treatment can not be determined in a manner comparable with State reports by reason of the fact that where available, Government medical officers and Government hospitals furnished at departmental expense the necessary aid and treatment for employees within their respective divisions of service.

The act compensates permanent partial disabilities on the basis of the actual wage loss, there being no schedule or fixed standards of benefits. This leads to a cessation of payments on account of injury when a workman returns to work after a mutilation if he is reinstated at his prior rate of wages, which results in a low rate of compensation for serious injuries in many cases. Thus in 23 cases of loss of eye, the average award was \$116.61; in 6 cases of loss of right hand, the compensation averaged \$175.05, while by some reversal of conditions 4 cases of loss of left hand averaged \$204.15 each. In 1 case a man returned to work after 76 days of absence with a loss of the right forearm and a compensation award of \$137.03—less than the amount for either a right or left hand, and only a little more than the average for 16 cases of loss of the right index finger at the proximal phalanx, for which the average benefit was \$116.40. Three cases of loss of thigh received average benefits of \$319.99, while 5 cases of loss of leg were disposed of by average awards of \$357.48. For a foot \$211.54 was paid and for a left arm at the shoulder \$42.47.

Under the provisions of the compensation act further claim may be made in any of these cases upon a showing of loss of wages because of the disability. Doubtless

such a right is of distinct value to a disabled employee, but many will not understand their rights clearly, and will fail to present to the commission claims which are perfectly legitimate. In many of these cases, therefore, no further compensation will ever be paid. The commission feels that a compensation act which permits the limit of compensation for a serious permanent disability at as low a rate as is shown in these cases is not adequate even though these employees should be able to continue at work at the same wage as at the time of injury. There is the loss of the right hand, which is a constant handicap to the employee, preventing him from improving his position and becoming a serious inconvenience in all the activities of life.

Detailed tables are given showing the nature of the injury by kind, location and effect, distribution by duration and extent of disability, cause of accident by extent of disability, number of dependents in case of death, nature of disability and amount of awards in permanent total disability, etc. This material, with its continued accumulation, will furnish valuable data for a study of accidents, their distribution, and results.

Maryland.²

THE fifth annual report of the Maryland Accident Commission shows a total of 46,875 industrial accidents reported during the year covered. This was in excess of the number reported in the preceding year by 4,305 accidents. These accidents gave rise to 4,377 claims for compensation, or somewhat less than 1 claim to each 10 accidents. There were 4,370 claims disposed of during the year, of which 173 were for death. Awards amounted to \$980,469 in compensable cases, including medical expenses in such cases, while an additional amount of \$188,997 was awarded as medical expenses in cases where no claim for compensation accrued. The aggregate total from the year's work of the commission was \$1,169,466.

The nature of the disabilities is set forth in a brief table showing that of the 4,377 claims submitted 183 were for death, 5 for permanent total disability, 415 for permanent partial disability, 4 for temporary partial disability, and 3,770 for temporary total disability. A schedule for permanent partial disability cases is embodied in the law, and 688 cases of this nature were disposed of during the year, including permanent loss of use of a member or part of a member as well as its dismemberment. Of the 265 cases of loss or loss of use of a member 53, or exactly one-fifth, were of the eye. The next highest number, 36, was of the first finger, while there were 35 of the fourth finger, 30 of the second finger, 23 of the third finger, and 22 of the thumb. Of the 423 injuries involving partial loss or loss of use, 109, or about one-fourth, affected the first finger, 98 the second, 66 the third, and 37 the fourth. Only 14 eye injuries come within this class.

² Fifth annual report of the State Industrial Accident Commission of Maryland, Nov. 1, 1918, to Oct. 31, 1919. Baltimore, Md., 1920. 27 pp.

There were 37 injuries to the feet, of which 19 involved total loss or loss of use and 18 had partial effect.

The number of contested cases was 577; 158 hearings were requested by the employer and 255 by the insurer; claimants asked for but 56, while 108 were held on motion of the commission. Of these, 340 were decided directly for the claimant and 175 directly against him, others resulting in mixed decisions or continuances. Appeals to courts were taken in 46 cases, one-half by the claimant and one-half by employer or insurer.

The total number of employers insured under the law is given as 9,031. There is a State accident fund which had at the beginning of the year 1,438 policies in force, and at the end 1,652. Net premiums written during the year amounted to \$193,882. Losses during the year amounted to 49 per cent of the premiums written and the expense of operation was 8.4 per cent. An adequate catastrophe fund has been developed and a liberal surplus and reserves are now on hand; it is claimed that, due to the rates charged and the services rendered, the fund offers an economical and satisfactory means of insuring employers, which fact is believed to be quite generally recognized.

Reference is made in the introductory statement to anticipated amendments to the law which were submitted to the legislature in a special communication. The report does not indicate what the proposed amendments were, and its publication preceded the meeting of the legislature. The amendments enacted have been reported by an officer of the commission showing the principal changes effected. These include better control of insurance companies and self-insurers, an extension of the act to include all work of an extrahazardous nature instead of extrahazardous employment only, an increase of the benefits from 50 to 66 $\frac{2}{3}$ per cent of the average weekly wages, with an \$18 maximum instead of \$12 and an \$8 minimum instead of \$5. The total maximum is advanced from \$4,250 to \$5,000 and medical expense from \$150 to \$300. The waiting time is reduced from two weeks to three days, and the employments formerly specifically exempted may now come under the act by election. Other changes involve compensation for disfigurement and the vesting of specific awards for permanent partial disability, so that they shall not terminate upon the death of the beneficiary during the compensation period. This does not exhaust the list of changes made, but does include the principal ones, and shows a very marked and satisfactory advance in the liberality of the law.

Virginia.

THE workmen's compensation law of Virginia came into effect January 1, 1919. A pamphlet presented as the first annual report of this commission³ really covers but nine months, the fiscal year ending September 30. Being the first report, it is taken up in part with an account of the preliminary work of organization and adoption of plans. Special attention is given to the question of insurance, particularly through the agency of reciprocal exchanges. The general insurance law of the State does not permit the operation of reciprocal exchanges, but the compensation act contains provisions that seem to contemplate their admission for compensation insurance. After a careful study of the subject the commission adopted regulations for the government of foreign mutual or reciprocal associations or exchanges, with which three exchanges have complied. The recommendation is made that the subject be given attention by the legislature, inasmuch as it is properly a matter to be supervised by the State commissioner of insurance rather than the industrial commission.

Self-insurance is permitted by the act, and is naturally availed of mainly by larger employers; 94 certificates have been granted, covering approximately 55,000 employees, or between 20 and 25 per cent of the total number of employees under the act. Twenty-five casualty companies are authorized to do business in the State, of which eight wrote approximately 70 per cent of all compensation business. The universal standard workmen's compensation policy, in use in about 20 States, was adopted as the standard policy for the State, though existing policies expiring not later than December 1, 1919, were permitted to continue by the attachment of an approved form of indorsement.

The act is elective, election being presumed where the employer has 11 or more employees. Farm labor, domestic service, and common carriers using steam as a motive power are excluded. The act is compulsory in its application to State and municipal employees without regard to their number. The records show 4,695 private employers with between 225,000 and 250,000 employees under the act. Only 35 employers, mostly small employers of labor, and 24 employees rejected the provisions of the act.

Compensation is paid on a basis of 50 per cent of the employees' wages. What this actually amounts to is shown by computations covering 10,776 nonfatal cases. Of these, 2,767 involved disability for longer than two weeks and were compensable. Two of these

³ First annual report of the Industrial Commission of Virginia for the year ending Sept. 30, 1919. Richmond, Va., 1920. 123 pp.

were cases of permanent total disability and received awards amounting to \$4,000 and \$3,980 respectively. The time loss for the 8,009 noncompensable cases was 51,874 days. At the average weekly wage the total time lost represented a wage loss of \$863,442. The compensation to be awarded, on an average basis, amounted to \$223,163 in addition to medical and hospital attention, or just above one-fourth of the amount lost by the worker.

Of 144 fatal accidents 88 had been disposed of, all but 3 leaving dependents. In 71 cases there were total dependents and in 14 partial dependents. The estimated value of awards in death cases with dependents made an average of \$2,221.

In commenting on the nine months' experience, the opinion is expressed that the law "has, without question, fulfilled the expectation of its supporters." Relief has been prompt and though moderate it has not been reduced by costs; while the removal of friction developed in suits for damages has "promoted community of spirit between employer and employee." The elimination of court costs and the relief of poverty are also factors to be considered.

Recommendations for changes in the law cover a simplification of the method of computing wages, and an amendment making the law applicable to employers of 5 or at most 7 workmen, instead of 11 as at present, as this number "deprives a great many employees of the benefits of the act and creates too much discrimination in certain classes of industries." As a matter of both justice and economy, medical aid should cover the whole period of disability, unless the commission found an earlier discontinuance fair and proper, instead of limiting it to 30 days. The waiting time should also be reduced from 14 days to 7. Other changes are also recommended, including the increasing of the burial allowances and the allowances where a father or mother or infant brothers or sisters survive as partial dependents of the deceased workman, compensation for a loss of use as well as for loss of a member, a full report of accidents, etc.

SOCIAL INSURANCE.

Report on Proposed Scheme for Mothers' Allowances in Ontario.

THE Department of Labor of the Province of Ontario has recently issued a report,¹ setting forth the results of an investigation into the problems which would be incident to the inauguration of a proposed scheme of mothers' allowances in Ontario, including the demand for such a system, the need of it, the extent of its application, an estimate of the cost involved, and the administrative problems which would have to be met.

The information for the report was gained through a study of the experience of jurisdictions in which mothers' allowance schemes are now working, from charitable and rural organizations, and from personal visitations.

A study of widowhood in Ontario was first undertaken, and statistics were compiled showing the actual number of widows with children under 16 years of age in the Province, on June 22, 1918. These statistics show the number of children in each family and their nationality. From representative districts names of 500 widows with children, exclusive of soldiers' widows, were chosen, 400 of whom were visited by special investigators and information secured as to the circumstances of the home. The aim of these investigations was to discover in how many instances the welfare of children was jeopardized by poverty and in what percentage of cases the Government would be justified in contributing toward the support of these children in order that they might be assured of adequate sustenance and home care.

Public hearings were held in four cities of the Province to give as widespread opportunity as possible for expression of public opinion. Opinion expressed at these hearings was uniform and positive in its statement of the need for a mothers' allowances act in Ontario.

It was found that there were 16,048 widows in Ontario with a total of 31,223 children. Of the 400 representative families visited it was found that there were 80 needy widows and 224 needy children. By proportionate computation it was estimated that there are 3,210 needy widows, exclusive of soldiers' widows, and 8,987 needy children under 16 years of age in the Province.

¹ Ontario. Department of Labor. Mothers' Allowance; an Investigation. Toronto, 1920. 126 pp.

The average cost of maintaining these children in institutions, based on the report of the inspector of public charities, would be \$1,078,440 per year.

Based on the comparison with the cost of mothers' allowances in 11 States of the United States, by number of children benefiting, the cost of such a scheme for Ontario would be \$817,000. Based on comparison with the expenditure of Manitoba for the same purpose, by number of children benefiting, the cost for Ontario would be \$1,027,064.

This estimate includes provisions for widows only. The report discusses the advisability of including in the proposed act for Ontario wives of the incarcerated insane, of the permanently incapacitated, wives of prisoners in penal institutions, deserted wives, and unmarried mothers. Estimates are made of the additional cost of including such cases. Estimates of the cost of such a system, in case one-child families and children over 14 years of age are excluded, are also made.

Mothers' aid laws operating in the Canadian Provinces are reprinted in an appendix to the report.

LABOR LAWS AND REGULATIONS.

German Works Council Law.¹

Origin of the Works' Councils.

THE works council law, passed on January 18, 1920, by the German National Assembly, has been called the "acid test" for the new German Government. This Government, being revolutionary and socialist, started forth with the most honest intentions of socializing industry; perhaps not all industry and perhaps not all at once, but nevertheless the "socialization of the means of production" (to use the old Marxian phrase) was to replace the capitalistic order. Bit by bit the program of socialization has been abandoned; first, because the German Government, which is strongly anti-Bolshevik, was frankly terrified at the results of the socialization of industry as reported from Bolshevik Russia and Bolshevik Hungary, and second, because the industrial state of the country seemed to the Government so entirely abnormal and so extremely unpromising that it did not venture to embark on any big industrial schemes which would in all probability be foredoomed. Yet for 60 years the German socialists had talked socialization. With the advent of revolution no power on earth could prevent a renewed outburst of scheming, planning, and contriving as to the best methods of socialization. Some of these schemes are very interesting; only a few of them have been realized, and one of these few is the works council law.

A discussion of the law may be preceded by a few remarks on the origin of the works councils. As is well known, at the outbreak of the revolution there were formed in the big German industrial and commercial concerns workers' councils (*Arbeiterräte*) which bore an essentially political character. They set themselves the task of converting society from its old institutions into new forms, and their work seems indeed to have been very useful in many instances. But when, after the revolution, the new régime had established itself and the task of the workers' councils was thus accomplished, these councils were not very much inclined to dissolve. The reason

¹ This article is based on the following sources: Deutsche Nationalversammlung 1919-20, 140th session, Jan. 18, 1920; Deutsche Nationalversammlung 1920, No. 2028, Entwurf eines Betriebsrätegesetzes; German Works' Council Law, by Miss L. N. Matthaei, Welfare Work, London, March, 1920, p. 35; The German Works' Council Bill, The Nation, New York, Jan. 31, 1920, p. 157; Workmen's shop councils in Germany, U. S. Bureau of Foreign and Domestic Commerce, Commerce Reports No. 294, Washington, Dec. 16, 1920, pp. 1540-1544.

See also "German Workers' Councils—Their Organization and Functions," in MONTHLY LABOR REVIEW, September, 1919, pp. 125-133.

was not far to seek. The councils had not limited themselves to the field of politics, but were active upon economic grounds as well. They had stood before the employers as the representatives of the workers, and in those tumultuous times which immediately followed the downfall of the old régime had often wrung important concessions from the frightened employers by means of "wild" (unauthorized) strikes.

These successes of the workers' councils turned the workers away from the tactics of the old trade-unions and created a strong distrust of the experienced union leaders. The German trade-unions have not let the revolution carry them away from the path which they have steadily followed for many years. In November, 1918, they had concluded a working agreement with the united employers' associations² whereby, among other things, the right was extended to the workers of a voice in the management of the business in which they were employed, as well as of the 8-hour day and other improvements in the conditions of labor. A large proportion of the workmen, however, were not content with these results obtained by peaceful means. They saw the opportunity opened to them by means of the workers' councils to turn to advantage the straits in which many employers found themselves and to introduce the most extraordinary demands. When they saw that the leaders of the trade-unions were not inclined to support them in their destructive policy, opposition arose to the old line and conservative organizations. The latter had achieved their task and could vanish from the scene; the workers' councils were to take over their prerogatives.

Even when the Government itself decided that the workers' councils had become superfluous now that normal conditions were more nearly restored, it soon became evident that they could not be reduced to their former place. It was when enthusiasm for a socialization program was somewhat waning, and the Government was being pushed into a conservative position, that *Vorwärts*, the leading socialist paper, declared that the works council law should be the acid test; if the Government were to give way on this last point, then it might as well save itself the trouble of calling itself socialistic at all.

Yet the Government, for all its good will, might have been forced to give way had not the workers taken precautions. In the spring of 1919 they bound the Government by a kind of signed contract to certain fundamental principles. The Government issued a statement which assured the continuance of the workers' councils. The statement was as follows: "The workers' councils are fundamentally recognized as representatives of economic interests and are grounded on

² See MONTHLY LABOR REVIEW, April, 1919, pp. 158-160.

the constitution." The curious thing about this guaranty is that it was hastily given before the rest of the constitution had been even discussed. Afterwards it was embodied, somewhat enlarged, as article 165 of the new German constitution.⁸ This article embodies two basic principles: Absolute equality of representation as between employers and employed on all industrial bodies of whatsoever kind, from the top to the bottom of industry, to be established as an inviolable constitutional principle. This is really a kind of base-defense line; if hard pressed the workers could always fall back on it; protected by entire parity of representation on all joint bodies, they could not be ousted from all their positions in industry. The worker is to be treated no longer as a mere cog in the machine, but is to be recognized as an active and conscious agent of production, endowed with the power to offer or withhold his cooperation in making the productive system work.

The constitutional principles are sometimes the most shadowy of safeguards, and the workers had the prudence to bargain for certain definite machinery as well. This machinery has an apex, a middle, and a base. The apex, the national workers' council (*Reichsarbeitserrat*) is to be a "chamber of labor," i. e., a great parliament of all workers called together to advise the country in a professional capacity on industrial and social legislation. The middle is to be a system of district workers' councils (*Bezirksarbeiterräte*), feeders to the national council; but the foundation is to be the works council (*Betriebsarbeiterrat*), i. e., councils in the individual establishments, the worker in the factory itself, so to say.

The system, then, is to be worked from the inside outward. First, the worker is to establish himself as a controlling agent in his own factory, and then to advance to organize national production. No one is as yet troubling much about the rights and duties of district councils or of the national workers council, though the Government is said to have worked out a complete scheme. It is too obvious that the first step of establishing control over the employer within the factory will be so stupendous a task as entirely to dwarf all others. Or, to put it this way: The great fight of the nineteenth century was for the protection of the workers; the great fight of the twentieth century will be for control by the workers, and it is this fight which has been inaugurated on the Continent by the German works' council law.

Terms of the Law.

THE works' council bill as originally submitted to the National Assembly was composed of 56 articles. Its first formal reading in the assembly took place on August 21, 1919, its first reading in

⁸ A translation of the sociopolitical provisions of the new German constitution may be found in the MONTHLY LABOR REVIEW of December, 1919, pp. 132-135.

committee November 28, 1919. It was discussed by the committee in 43 meetings, lasting seven weeks, 127 amendments being brought in. As passed on January 18, 1920, after its third reading, the law contains 106 articles. Lack of space does not permit printing the text of the law in the MONTHLY LABOR REVIEW. Briefly summarized, its provisions are as follows:

Establishment, election, and composition of works councils.—Works councils (*Betriebsräte*) are to be elected in all establishments employing 20 or more persons, whether manual workers or salaried employees. In establishments employing less than 20 but at least 5 persons a single shop steward (*Betriebsobmann*) is to be elected in place of a works council. The law is applicable also to agriculture and to home workers. A special law is to regulate the establishment of workers' representation in ocean and inland navigation. (The efforts of the reactionary employers to omit agriculture and all small industrial establishments were defeated.)

In establishments employing less than 50 persons the works' council is to consist of 3 members, in those employing 50 to 99 persons, of 5 members, and in those employing 100 to 199 persons, of 6 members; after that the membership of the works council is increased by one member for each 200 employees in establishments employing 200 to 999 persons, for each 500 employees in establishments employing 1,000 to 5,999 persons, and for each 1,000 employees in establishments employing 6,000 or more persons. The maximum membership of a council is limited to 30 members. If in a single commune, or in two or more economically interdependent communes, there are several similar or economically interdependent establishments owned by the same firm, then, by unanimous resolution passed by all the individual works councils, a central works council (*Gesamtbetriebsrat*) may be formed in addition to the individual works councils. Under the same conditions there may also be formed a joint works council (*Gemeinsamer Betriebsrat*), which takes the place of the individual works councils.

The manual workers (*Arbeiter*) and the salaried employees (*Angestellte*)—this careful distinction between manual and nonmanual workers runs through the entire law—elect separately members of the works council by secret ballot and from their own midst. The works council is to safeguard the common economic interests of both manual workers and salaried employees as against the employer. In addition to the works council, there are to be formed in each establishment a workers' council (*Arbeiterrat*) and a salaried employees' council (*Angestelltenrat*) to represent the special interests of each of these two groups of employees. The members of the works council elected by the manual workers form the workers' council and the

members elected by the salaried employees form the salaried employees' council.

All manual and nonmanual workers, without distinction of sex, who are over 18 years of age and in possession of their civic rights have the right to vote at the election of works councils. Eligible to the works councils are all persons entitled to vote who are German citizens over 24 years of age, have finished their vocational training, and on election day have worked at least six months in the establishment and at least three years in the trade or occupation in which they are engaged. Members of the works council are elected for a term of one year. Their reelection is permissible.

Meetings of the council.—The works council, if composed of less than 9 members, elects from among its members a chairman and a vice chairman. If composed of more than 9 members, it elects from among its members an executive committee of 5 members. The chairman of the works council represents the council before the employer and before the arbitration board; he also calls the meetings of the council and determines the agenda. On request of at least one-fourth of the members of the council or on request of the employer a meeting must be called by the chairman. The employer has the right to be present at meetings called on his request, and he may also be invited to be present at other meetings. The meetings of the council shall, as a rule, take place outside of working hours, and are not open to the public. Every meeting which is to take place during working hours shall be reported to the employer. A resolution of the works council is valid only if all the members have been requested to attend the meeting, have been informed of the questions to be discussed, and if the number of members present is equal to half the number of members of the council. Members of the works council and their alternates are to exercise their office without compensation. Necessary loss of time due to attendance of meetings of the council shall not entail reduction in wages or salary. The necessary costs of management of the works' council are to be borne by the employer, unless otherwise provided by collective agreement. He must put at the disposal of the council the rooms and equipment necessary for the holding of its meetings and the transaction of its business.

Termination of membership.—Membership in a works council comes to an end when any member resigns, ceases to be employed in the establishment for which the council has been formed, or loses his qualification for election. On the proposal of the employer or of at least one-fourth of the workers entitled to vote, the district economic council, or, as long as such a council does not exist, the conciliation board may decide that any member guilty of gross neglect of his civic duties shall cease to be a member of the works council.

Under the same conditions the district economic council or the conciliation committee may dissolve the works council.

The works assembly.—The law also provides for a works assembly (*Betriebsversammlung*) composed of all the manual and nonmanual workers of the establishment. This assembly really stands in authority above the works council, for on demand of the employer or of at least one-fourth of the workers entitled to vote the chairman of the works council must convene the works assembly, and, as has been said above, a minority of only one-fourth of the workers entitled to vote may bring in a motion that the district economic council dissolve the works council. The works assembly can make demands and proposals to the works council. Separate works assemblies may be held by the manual workers and by the nonmanual workers. The employer has the right to be present or to be represented at works assemblies and to take part in the proceedings, but can not vote. Meetings of the works assembly shall as a rule take place outside working hours; if this rule is departed from in urgent cases, the consent of the employer must be obtained.

Trade-union representation.—In the preceding pages it has been stated that the movement toward works councils proceeded particularly from those who were opposed to the conservatism of the trade-unions. Is it the endeavor of the present law to make the trade-unions superfluous and to have their tasks taken over by the new system of works councils? The provisions of the law make it evident that this is in no sense the case. Article 8 seems to permit no misunderstanding on this point; it says: "The right of the economic organizations of manual workers and salaried employees to represent the interests of their members is in no way prejudiced by the provisions of this law." The law, however, does not stop at this declaration; it is evident from a number of its provisions that there is no intention of driving the trade-unions from their chosen field of activity. Article 31, for instance, provides that on motion of one-fourth of the members of a works council one representative each of the economic organizations represented in the council shall be admitted to the meetings in an advisory capacity. The same right, to be sure, is granted to the employer, who may demand that representatives of the economic organizations to which he belongs shall be admitted to the meetings of the council in an advisory capacity. Articles 66 and 78, prescribing the duties of works councils and of the group councils of manual workers and salaried employees, provide that they shall see to the fulfillment of the collective agreements concluded by the trade-unions, and that if such agreements do not exist they shall cooperate in the establishment of wage and working conditions in deliberation with the economic organizations of employees that may be concerned therein. Finally—and this is the farthest step of all—article 62

provides that if in a collective agreement declared by the Government to be binding on a whole industry, a method of representation for the employees is adopted different from that introduced by the present law, the works councils provided by the law shall not be introduced in that industry; and if they already function in that industry, they are to be dissolved.

It is evident from all these quotations that the Government has desired workmen's councils only in addition to and cooperating with the trade-unions, and this is no wonder, for the socialistic members of the Government are recruited, for the most important part, from the leaders of the modern German trade-union movement.

Duties of the works councils.—The law assigns to the works councils the following duties:

1. In establishments with economic (commercial or industrial) aims to support the management with advice in order to assist it to bring the establishment to the highest possible state of efficiency.
2. To cooperate in the introduction of new labor methods.
3. To safeguard the establishment from violent disturbances, and, without prejudice to the rights of economic organizations of manual workers and salaried employees, to invoke the conciliation committee or some other conciliation or arbitration board agreed upon in case of disputes between the works council, the workers, or a part of the workers, and the employer which can not be settled by agreement.
4. To see to it that awards made by a conciliation or arbitration board in matters concerning the entire establishment and accepted by the interested parties be carried out.
5. To fix, in agreement with the employer, general shop regulations and any modifications of the same within the terms of collective agreements then in force.
6. To promote harmony among the workers and between them and the employer and to safeguard the workers' right of combination.
7. To receive complaints of the workers' and salaried employees' council and to dispose of them in agreement with the employer.
8. To take measures to combat danger to health and accidents in the establishment; support the factory inspectors and other officials in the task of combating these dangers by information, advice, and calling them in when necessary, and by supervising the carrying out of the orders of the industrial authorities and of the provisions for the prevention of accidents.
9. To take part in the administration of pension funds, company-owned workmen's dwellings, and other welfare institutions of the establishment.

The duties enumerated under 1 and 2 are not applicable to councils in establishments with political, trade-union, military, scientific, artistic, and similar aims.

In the exercise of its duties the works council must see to it that the workers as well as the employer abstain from making demands or taking measures which are apt to injure the common interests. The carrying out of resolutions adopted conjointly with the management of the establishment is to be effected by the management. The works council is prohibited from interfering with the management by making arrangements independently.

Duties of the group councils (workers' and salaried employees' councils).—The duties assigned by the law to the group councils, that is, to the workers' council and the salaried employees' council, are essentially the same as those assigned to the works council which represents the entire personnel, with the sole distinction that the group council can discuss or act only in matters concerning the group represented by it. In addition to the duties which the group council has in common with the works council it shall—

1. In so far as no regulation by collective agreement exists, in conjunction with the economic organizations of the workers or salaried employees, cooperate in the fixing of wages and other working conditions, especially in the fixing of piece rates or the bases for fixing such rates; in the introduction of new methods of payment; in the fixing of working hours, especially in extensions or reductions of the regular working hours; in fixing the annual leave of the workers, and in arranging conditions of apprenticeship;

2. See to it that war invalids and persons injured through accidents shall obtain employment suitable to their physical and mental ability and intervene in this sense with the employer and fellow workers in the establishment;

3. Cooperate with the employer in establishing rules for the hiring and discharging of workers and employees.

Control by the workers.—The most disputed provisions of the bill concerned the participation of the works councils in the management of the establishment and their right to interfere in the hiring and discharging of employees. These provisions were the crux of the law.

As has already been stated here, the works council has the right to "support the management with advice," with the object of increasing output, and to "cooperate in the introduction of new labor methods."

In undertakings in which there is a board of directors the works council has the right to delegate one or two of its members to that board who shall represent the interests and demands of the employees as well as their views and wishes concerning the organization of the establishment. These delegates of the works council have a seat and vote in the board of directors but do not draw directors' fees. They are under obligation to maintain secrecy with respect to confidential information given to them.

In an undertaking which is obliged to keep books and which employs as a rule at least 300 workers or 50 salaried employees the works council may request that, beginning with January 1, 1921, a balance sheet and profit and loss account for the past financial year be submitted to the executive committee of the council, or, in the absence of such a committee, to the council itself six months after the close of the financial year, at the latest. In this case also the council must maintain secrecy with respect to information of a confidential character.

The rights of the works councils described in the two preceding paragraphs are somewhat limited by the provision of the law that establishments of the two classes specified may on their request be exempted by the National Government from granting these rights if important State interests require it.

In order that the works council may fulfill its duties it has in all establishments with economic aims the right to request the employer to give to the executive committee, or, where such a committee does not exist, to the council itself, information as to all the transactions of the establishment which affect the labor contract and the work of the employees. In particular the employer shall on request show the wage sheets and make a quarterly report as to the condition and output of the establishment and the expected demand for labor. This information is to be considered confidential.

The employers' associations strongly opposed granting to the works councils an insight into the financial affairs of industrial establishments. But the concessions made by the law to the workers are not of great value. It is true the works councils are given representation on the board of directors of stock companies, and in other concerns they are entitled to receive an annual balance sheet and a copy of the profit and loss account, but, as secrecy must be maintained on all information obtained in this manner, the councils can not report back to the workers. This provision of secrecy was attacked by both socialist groups, but they were unsuccessful in the National Assembly. The council may inspect wage sheets but none of the books, or, in other words, it can not get a real grip on the finances of the establishment.

On the equally vexed question of hiring and discharging, the workers have lost in committee the right, as originally suggested, of cooperating by means of a confidential delegate in the engagement of workers, but retain a modified right to be heard as to dismissals, namely, as to dismissals for political, military, religious, or trade-union activities, or where no reasons have been given for discharge, or where unjustifiable dismissal has taken place not occasioned by the conduct of the employee or by the state of the business, or where dismissal has taken place because the worker refused to perform other work than that contractually agreed upon on his engagement. In such cases the employee may appeal to the workers' or salaried employees' council, which, after investigation may negotiate with the employer. If no agreement is reached the case goes to the arbitration board, whose decision is final.

Protective and penal provisions.—The law prohibits the employer and his representatives from interfering with their workers in their right of electing members to the works councils or in the acceptance of membership on such a council and exercise of its functions or from

discriminating against them for this reason. Before giving notice of discharge to a member of a works' council or before transferring him to another establishment the employer must obtain the consent of the works council, unless the discharge is due to a legal obligation or one arising out of a collective agreement or an award of a conciliation or arbitration board, or is given without notice for adequate reasons which are justifiable under the law dealing with the termination of labor contracts without notice. Employers or their representatives who contravene these provisions or fail to furnish to the works' council the business information prescribed by the law are liable to a fine up to 2,000 marks (\$476, par) or imprisonment. If an employer, or his representatives, willfully suppresses facts or gives false information to the works council in submitting data to it concerning the financial condition of the establishment he becomes liable to imprisonment up to one year or a fine up to 10,000 marks (\$2,380, par) or both.

Transitional provisions.—The law authorizes the national minister of labor to issue, with the consent of the Reichstag and of a committee consisting of 28 members of the latter, regulations for the carrying out of its provisions. The law comes into force on its promulgation, and within six weeks after its coming into force a works' council must be elected in each establishment. After the election of a works council all workers' councils and workers' and employees' committees existing in an establishment cease to function.

With the coming into force of the works council law a number of contradictory provisions in other laws and in the Industrial Code are abrogated.

New Regulation of Unemployment Relief in Germany.

A NEW order regulating unemployment relief was published in Germany on January 26 of this year.¹ It came into force on February 1 and contains the following provisions:

The cost of the unemployment relief is to be borne, one-half by the nation, one-third by the Federal State, and one-sixth by the commune or communal union. In the case of poor communes the grant from the nation may be increased. The commune obligated to grant relief is that in which the person entitled to relief was residing when the period of unemployment began. Unemployed persons who since August 1, 1914, have moved to another locality are as far as possible to return to the district where they lived at

¹ Kölnische Zeitung. Cologne, Feb. 2, 1920. Noon edition.

that date. Relief will not be granted to them in any other district for longer than four weeks. Communes and communal unions are ordered to refuse relief to any person who declines an offer of work, even though it lie outside his usual occupation and place of residence, if it is within his physical capacity.

The districts of Germany have been classified under A, B, C, D, and E, in accordance with the average daily earnings of day laborers in the various localities as established by the sick funds, and different maximum relief rates have been fixed for these classes. These rates are the following:

MAXIMUM UNEMPLOYMENT RELIEF RATES IN GERMANY, EFFECTIVE FEBRUARY 1, 1920.

[Par value of the mark is 23.8 cents.]

Item.	Maximum rates per day in districts of class—			
	A.	B.	C.	D and E.
	Marks.	Marks.	Marks.	Marks.
Males over 21.....	6.00	5.00	4.00	3.50
Males under 21.....	4.25	3.50	3.00	2.50
Females over 21, not members of another person's household.....	5.00	4.50	3.50	3.00
Females over 21, members of another person's household.....	4.25	3.50	3.00	2.50
Females under 21.....	3.00	2.50	2.25	2.00
Family allowances: ¹				
Wife.....	2.50	2.25	2.00	1.75
Each child and other dependent.....	1.75	1.75	1.50	1.25

¹ The total relief granted to an unemployed man for his family may not exceed 1½ times the amount granted to himself.

Proposed Labor Law of Switzerland.¹

THE Swiss Federal Assembly promulgated an act on June 27, 1919, providing for the establishment of (1) a Federal labor department in the ministry of economics, (2) a Federal wage commission, and (3) Federal wage boards. Subsequent to the passing of this measure the demand was made that it should be submitted to the referendum; the requisite number of signatures was obtained, and it is now announced² that the act will be put to the popular vote upon a date to be fixed later.³ Meanwhile a summary of the leading principles of the act may be of interest.

A labor department is to be established for the purpose of studying labor conditions in "home industries," factories, workshops, mines, etc., arts and crafts, and commerce. Its functions are: To inquire into labor conditions in general, the labor market, the standard of living and housing conditions of workers, and migration of

¹ Extracted from the Labour Gazette, London, January, 1920, p. 11. Data taken from Feuille Fédérale Suisse, July 2, 1919.

² Feuille Fédérale Suisse, Dec. 24, 1919.

³ The Bureau has been advised by the Swiss Legation that the referendum, which was held on Mar. 21, 1920, resulted in rejection of the proposed labor law by a vote of 252,662 to 252,243.

labor; to prepare schemes for improving working conditions and raising the standard of living of workers; to give effect to the decisions of the Federal wage commission; to decide in cases of appeal relating to the nonobservance of legally established working conditions; to express an opinion, at the request of the Federal Council, on proposals put forward by the wage commission and the wage boards; to formulate proposals regarding "common rule" declarations for collective agreements covering groups of workers for whom no wage boards exist, and proposals connected with the question of permitting different types of agreements; and to supervise the administration of the wage boards.

The labor department is also empowered to institute inquiries, to examine pay sheets, and to interview heads of firms and members of the staff, all of whom are bound to supply the information desired. It may demand the assistance of cantonal and communal authorities, public labor exchanges, statistical offices, and the employment exchanges of the trade organizations concerned. These powers are also granted to the wage boards.

A wage commission and wage boards are established for the purpose of regulating wages and collaborating with the labor department in the tasks which devolve upon it.

The Federal wage commission is empowered to decide appeals against wage rates fixed by the wage boards; to lay proposals before the Federal Council relative to "common rule" declarations and standard agreements; and to give advice, at the request of the labor department, on matters which come within the province of the latter. The wage commission is to consist of a president—this office being filled by the director of the labor department—two independent members, and at least three representatives of employers and three representatives of employees. Women are to be "adequately" represented upon the commission. The members are appointed by the Federal Council for periods of three years. The trade organizations concerned are to be consulted in regard to nominations.

Wage Boards.

THE wage boards are commissioned to fix wages in cases submitted to them by the labor department; to carry out the instructions of the labor department; to supervise the observance of legal working conditions; to submit to the Federal wage commission proposals relative to "common rule" declarations and standard agreements; to give advice on questions submitted by the labor department; and to report on their activities to the labor department. A wage board will consist of an independent chairman, at least three representatives of employers and three representatives of the workers. Women

are to be "adequately" represented. The powers of the wage boards to fix wages are for the present restricted to the fixing of minimum rates of wages for workers employed in "home industries"; but the Federal Assembly may extend these powers, enabling the wage boards to regulate wages generally. For the purpose of dealing with the regulation of working conditions of nonmanual workers special wage boards, with representatives of such workers as members, will be set up. The wage boards are to be appointed by the Federal Council for periods of three years. The members are to be appointed upon nomination by the wage commission. There are to be wage boards for the various trade groups, and, when necessary, for certain districts or parts of the country. The trades concerned are to be consulted.

Wage rates are to be fixed after due consideration has been given to all circumstances, and, so far as possible, on the basis of equal pay for equal work, without distinction of sex. Wages may be graded according to local conditions, trade groups, or the capacity of the worker.

All requests for the fixing of wage rates must be addressed to the labor department, which shall transmit them to the competent wage board. After hearing the parties concerned and ascertaining all necessary facts the chairman of the board will endeavor to secure a unanimous decision by the board. If he succeeds, the wage rates fixed will be enforced immediately. If the board is not unanimous, the verdict of the majority shall be accepted. In this case any person concerned may enter an appeal against the decision. The appeal must be made within a period to be fixed by the wage board, but in any case not less than 10 days, to the wage commission through the medium of the labor department. If the fixed period expires without appeal having been made the decision shall enter into force. The decision of the wage commission in cases of appeal shall be final.

Provision for Drafting Standard Agreements.

IF THERE is a manifest need the Federal Council may, on the proposal of a wage board, after consulting the trade organizations concerned, make a "common rule" declaration for a collective agreement, and may draft standard agreements, from the provisions of which it shall not be permissible to depart. If such collective agreements and standard agreements specify rates of wages, the power to fix wages granted to the wage boards shall be replaced by the right to lay proposals before the Federal Council. Collective agreements in those trades for which no wage boards exist may be made subject to "common rule" declarations without any proposal being made by wage boards.

Applications made to the Federal Council for "common rule" declarations must be addressed to the labor department, which shall transmit them to the competent wage board after hearing the views of the trade organizations concerned. The opinion of the wage board shall be submitted to the wage commission, which shall decide whether or not the application shall be laid before the Federal Council. If the commission decide in the negative the matter shall not be proceeded with; if in the affirmative, the labor department shall express its opinion on the proposal to be submitted to the Federal Council. The labor department must ascertain that the proposal is not at variance with wage rates which may already have been fixed by wage boards.

Every decision involving the laying down of working conditions must be accompanied by a statement of the date on which the decision is to come into force and of the date after which a revision may be demanded. If a considerable change of circumstances should arise a demand may be made for a revision before the fixed date.

During the period when the question of regulating working conditions is being considered, and during the period of validity of orders and decisions, the parties concerned are bound under penalty of fine to avoid all disputes connected with the working conditions under consideration or which are the subject of orders or decisions.

Fines ranging from 10 to 500 francs [\$1.93 to \$96.50, par] are to be imposed for contravention of measures adopted by the labor department and wage boards to obtain information; for nonpayment of fixed wage rates, if payment is refused maliciously or in defiance of regulations; for contravention of regulations laid down in other acts for regulating working conditions; and for failure to observe the obligation to avoid disputes in the conditions stated above.

In case of need, and after consulting the cantonal governments, the Federal Council is to establish Federal conciliation boards, and to determine their methods of procedure and the relations between them and the cantonal and communal authorities.

HOUSING.

Company Housing in Anthracite Region of Pennsylvania.

By LEIFUR MAGNUSSON.

COAL was first commercially shipped from the Lehigh Valley of Pennsylvania in 1820; 365 tons constituted the shipment for the year. The anthracite region occupies an area of about 500 square miles in the northeastern part of Pennsylvania. The region being compact and having become densely populated by reason of the development of other industries both depending upon and contributing to the anthracite industry, the isolation of the anthracite mining town is at present not so great as that of other mining towns. Many of the present company-owned houses are now situated in populous cities like Scranton and Wilkes-Barre.

Scope of Survey.

THE Bureau's survey in the anthracite region covered 24 companies, employing altogether 116,208 men and operating 104 establishments or groups of mines. Taking those companies which reported the number housed it appears that they employ 90,608 men, and house 20,660, or 22.8 per cent, of their entire forces. The largest company supplying information employs approximately 22,000 men. One company employing 11,115 men houses only 2,400, or 21.6 per cent; and another employing 725 men houses only 76. The survey in the anthracite region included 6,853 dwellings.

The Anthracite Town.

THE anthracite town is almost always situated in close proximity to the mine and along any natural highway passing through the region. None has been scientifically planned and practically all are laid out in rectangular fashion.

The towns are almost all situated near larger cities, with which they are connected by rail or electric lines. Consequently they are not much more than groups of houses near the shafts and breakers; they are not complete towns in the sense of being self-sufficing, with stores and means of recreation. In that respect they are depending more and more upon the neighboring cities.

As a rule, no paved streets are provided in anthracite mining towns; and no paved alleys were observed by the investigators. Only a few communities of the 30 visited by the agents of the Bureau were reported as having a street paved with tarvia, macadam, or concrete. The principal street was frequently the principal township highway. Dirt roads, covered in some instances with coal-dust waste, are the rule. There is a general lack of care for alleys and roads, although a few notable exceptions are reported.

The streets are generally about 45 feet in width. In certain hillside towns the houses all face one way and no question as to street widths is involved. Alleys average about 17 or 18 feet in width.

There is no evidence of lot crowding in this region. Lots for each family in the semidetached houses range from 25 to 50 feet or even from 50 to 60 feet in width. For the single houses the width of the lots varies from 50 to 60 feet.

Early Housing Conditions.

THE early miner's house was of the double or semidetached type made of board and batten sides on the framing. A mere dugout served for a cellar. While the type still persists, the houses recently built show an improvement in appearance and substantialness. The early houses were neither ceiled nor plastered inside and rarely painted on the outside. To each family, occupying half of the house, was allotted three and one-half rooms, so called, two on the first floor, a fair-sized room on the second floor, and back of that, formed by the pitch of the roof, the half room, more in the nature of a storage room or attic than a sleeping room. The houses built in those days i. e., during the Civil War times up to the seventies, naturally had no bath nor even running water in the kitchen. The occupants were fortunate if they had a common hydrant within the distance of an ordinary city block.¹

An interesting view of some housing conditions prevailing in 1898 is given in a report of the local resident engineer to the president of a company operating in the Hazleton mining district. Describing "the present [1898] condition of the dwelling houses on the property" the engineer states:

Many of the roofs do not leak very badly, but, in attempting to patch an old shingle roof, such as those mentioned as requiring to be renewed, the work of repairing many times will be found to cause new leaks.

The cellars (with the exception of Nos. 90 to 99 inclusive, and all the houses recently built) have been excavated under one half, or along the side of the block; generally under the front side, and have but one window of two panes of glass, with a screen over the outside, so that the window can be taken out for ventilation. In some cases the occupants have excavated the earth from the other half of the cellar. There should be an additional window in the cellar so as to afford proper ventilation, and aid in

¹ Edward W. Parker: Workmen's houses in the anthracite regions. Housing problems in America. Proceedings of the fifth national housing conference, Providence, R. I., October, 1916, pp. 54-66.

drying up dampness that we found to exist. In one case, Nos. 116 and 117, there was a drain stopped up, causing about 2 to 3 feet of water standing in the cellar.

The privies, in all cases but where the new or recently built houses are located, are in very bad shape; in most cases the appearances would indicate that the contractor was obliged to put down the pits a certain depth, and plank up the sides. In sinking these pits rock probably was encountered and the regulation height of plank curbing put in, thus bringing the floor of the privy several feet above the surface. The privy walls are full up to the top of the ground, and the contents of the wells flow out into surface ditches, new houses excepted. In the older houses the privy buildings have the appearance of having been built by the tenants, and are poor apologies for the purpose. My opinion is that if these premises came under the inspection of the health officer, these affairs would be badly criticized.

Not many of the houses have any protection over the front doors, thereby permitting the storm to drive into the houses under the doors, that do not fit very closely to the floor. A weatherstrip on the bottom of the door in such cases would assist in remedying this; and a small porch would also be of service; which if made, would prevent the building of such porches by the tenants as is sometimes the case, and so built do not always improve the external appearances.

If it is concluded to paint the houses—the older ones—(the new have been painted) in most cases it will be necessary to new weatherboard one side only, and renail the other three sides of these buildings. If, however, it is not expedient at this time to expend so much money in painting, some patching and renailing of the siding could be made to pass for a while longer, and probably, too, some of the roofs might be left untouched in the same way.

The chimneys, where they start from the third or attic floor, should be changed so as to start from the bottom, as now in these cases the stovepipe is carried up through the floors, enters the chimney in the attic, and is positively dangerous from fire.

We found many of the houses clean and neat; others just the opposite. The best houses are occupied by Americans, but the majority of the occupants are foreigners.

Age of Houses.

SOME of these early constructed houses are still in existence and in use by the companies. One company has 20 semidetached houses, built in 1857; another has 88, built in 1876, and still another has 137 erected in 1885. A fourth company has houses dating from 1851. Of the 1,323 houses for which the year of construction is known, 480, or 36.3 per cent, had been erected before 1881 and 753, or 56.9 per cent, before 1890.

Observation of some of the older houses showed them to be of substantial timber, the boards fully an inch in thickness, and free from knots. By removing the battens, papering, and then weatherboarding, warm and comfortable houses may be made out of them.

Types of Houses.

THE type of house at present prevailing in the region has not changed greatly since the beginning of the industry. The tendency has been to enlarge the original type of house.

With few exceptions the houses are of frame, are weatherboarded, have shingle roofs, and are plastered or ceiled inside. They differ very slightly from the houses of the soft-coal region.²

² See MONTHLY LABOR REVIEW, April, 1920, pp. 215 to 222.

FIG. 1.—Detached houses for miners in the anthracite coal region. Decidedly larger and superior to the average.

FIG. 2.—Eight-room semidetached houses in anthracite region, built in 1870. Probable cost at time of survey (1916), \$1,200 per dwelling (family unit); rent, \$8 per month per dwelling. Stove heat, running water in kitchen, outside privies. Larger and superior to the average house in the region.

FIRST FLOOR.

SECOND FLOOR.

FIRST FLOOR.

SECOND FLOOR.

FIG. 3.—First and second floor plans of detached frame houses for miners in anthracite region.

Of the 6,853 dwellings covered by the survey 6,708, or 97.9 per cent, are frame dwellings. Only 43, or less than 1 per cent, are of brick, and 102, or 1.5 per cent, are of stone, tile, or concrete, or other combination of materials.

There is a greater proportion of semidetached houses in the anthracite region than in any other locality studied by the Bureau, 4,923, or 80.9 per cent, of the houses here being double or semidetached, 728, or 12 per cent, single or detached, and 438, or 7.1 per cent, row dwellings. The type is not reported for 764, or 11.2 per cent of the total of 6,853 included.

Size of Dwellings.

THE distribution of dwellings according to the number of rooms shows that of the 5,320 for which this information has been furnished, the largest proportion, 1,724, or 32.4 per cent, have 6 rooms; the next largest proportion, 1,604, or 30.2 per cent, have 5 rooms. The average size of the miners' family quarters in the anthracite region is 5.5 rooms, as compared with 4.4 rooms in the soft-coal region. The distribution of dwellings by number of rooms is as follows:

NUMBER AND PER CENT OF DWELLINGS HAVING EACH CLASSIFIED NUMBER OF ROOMS, IN THE ANTHRACITE REGION OF PENNSYLVANIA.

Size of dwelling.	Number of dwellings.	Per cent of total.
2 rooms.....	37	0.7
3 rooms.....	247	4.6
4 rooms.....	920	17.3
5 rooms.....	1,604	30.2
6 rooms.....	1,724	32.4
7 rooms.....	479	9.0
8 rooms.....	237	4.6
9 rooms and over.....	72	1.4
Total.....	5,320	100.0

For 1,533, or 23.4 per cent, of the total number of 6,853 reported no information as regards number of rooms was secured.

Rent.

OF THE 5,303 dwellings for which rent per month in relation to number of rooms has been reported, the rent for 4,589, or 86.5 per cent, is below \$8 per month. Taking the dwellings which are typical as respects the number of rooms, namely, 5 and 6 room dwellings, it appears that of the former the largest proportion—436, or 27.3 per cent—rent for \$3 and under \$4 per month, and of the latter the greatest proportion—517, or 30 per cent—rent for \$6 and under \$7 a month.

The rents charged for dwellings according to the number of rooms are brought out in the table below.

NUMBER AND PER CENT OF DWELLINGS OF EACH SPECIFIED NUMBER OF ROOMS RENTING AT EACH CLASSIFIED AMOUNT PER MONTH, IN THE ANTHRACITE REGION OF PENNSYLVANIA.

Total.....	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Considering the rent paid per room per month, the details of which are not shown here, it is seen that the largest number (171, or 36.4 per cent of the 470 for which data were reported) of single or detached frame dwellings rent for from 50 cents to less than \$1; the next largest number (141, or 30 per cent) rent from \$1 to less than \$1.50. In the case of double or semidetached frame dwellings, the largest number (1,998 out of 3,984, or 50.2 per cent) range from \$1 to less than \$1.50 per month, and the next largest number (1,563, or 39.2 per cent) from 50 cents to less than \$1. The fact that the single houses rent for relatively less per room is explained by the fact that the semidetached houses cost more per room and therefore to bring the same return must be rented at a higher rate.

Modern Improvements.

INFORMATION as to conveniences and sanitary equipment provided has been given concerning 4,034 dwellings, or 58.9 per cent of the 6,853 covered in the anthracite region. Of the 4,034 dwellings, 1,824, or 45.2 per cent, have gas or electric light, but in practically all cases it is electricity and not gas which is used. All modern conveniences, including complete three-piece bathroom with sewer or cesspool connections are found in 255, or 6.3 per cent of the total reported. On the other hand, 1,813, or 44.9 per cent, have no modern conveniences at all, and have outside privies.

The 4,034 dwellings are distributed as to types of conveniences provided as follows:

NUMBER AND PER CENT OF DWELLINGS HAVING SPECIFIED MODERN IMPROVEMENTS, IN THE ANTHRACITE REGION OF PENNSYLVANIA.

Improvements.	Number of dwellings.	Per cent of total.
Bath, water-closet, running water, and electric light.....	¹ 234	5.8
Bath, water-closet, running water.....	21	.5

Outside privies only.....	1,813	44.9
Total.....	4,034	100.0

¹ 40 have combination bath and laundry tub in kitchen.

Maintenance.

AMONG different features of company management it may be noted that lawns are made and maintained by the tenants, while fences, where provided, are built and maintained by the company. Only four companies attempt to encourage gardening by giving prizes, while practically all the companies have either written rules or an unwritten agreement that tenants must either keep their houses in fair and habitable condition or vacate. The enforcement of the rule, however, depends largely upon the labor supply.

One informant observed at the time the investigation was made (1916), that he was putting up with tenants that he would not tolerate when the labor supply was abundant.

Ten of the 24 companies report that they undertake garbage collection for their tenants. However, as 3 of the 10 companies report that collection is made every two months, or even less frequently, the statement can apply only to rubbish and waste, certainly not to kitchen and table waste. In one instance the duty rests with the city, as the company houses are within an incorporated city.

Except in a few instances the open-vault privy is still used in the region. With regard to the frequency of cleaning, it appears from the reports of the companies that three report this as annual, three as biennial, one triennial, one as every 18 months, and two semi-annually; two companies report that the matter is left to the tenant, and two report that privies are moved to a new place when necessary. Other companies report that all privies are cleaned when necessary and not at any regular intervals.

Cost of Maintenance.

SEVENTEEN out of 24 companies covered in the anthracite region reported both rent receipts and annual expenses of maintenance of company houses. These companies may be placed in two groups according to the comparability of the data furnished. In the first group have been placed those which charge to their maintenance account not only ordinary labor and material for upkeep of the company houses, but also insurance, taxes, and additions and improvements, remodeling, etc., of the houses; in the second group, those which do not charge additions, improvements, and remodeling to that account. For the first group maintenance expenses absorb 69 per cent of the average annual rent receipts, and for the second group 32 per cent. The details are disclosed in the following table:

RELATION OF EXPENDITURE FOR MAINTENANCE AND THE AMOUNT INVESTED IN HOUSING TO RENT RECEIPTS OF CERTAIN COMPANIES IN THE ANTHRACITE REGION OF PENNSYLVANIA, 1911 TO 1915.

Company.	Value of houses.	Average annual rent receipts, 1911 to 1915.	Expenditure for maintenance.		Return on investment after deduction of charges to maintenance.		
			Amount.	Per cent of rent receipts.	Amount.	Per cent.

¹ Maintenance includes upkeep, insurance, taxes, additions, improvements, and remodeling.

² Deficit.

³ Not reported.

⁴ Maintenance includes upkeep, insurance, and taxes.

Administration.

THE larger coal companies in the region conduct their housing through a separate land department; for all other companies the housing enterprise is a part of the general operating business, segregated only in the accounting of the company. At each mine the local superintendent oversees the housing and community activities connected with the operation of the mine, so that a rather widespread paternalism still exists in the region.

Rents for company houses are collected by deduction from the employee's wages, 8 companies of the 24 included in the survey making deductions semimonthly and 16 monthly. Only two companies deduct rent in advance. A liberal policy appears to be observed in the matter of deferring collection of rent during the illness or unemployment of the worker. A few companies have no rule in that respect, but decide each case on its merits as it arises. Instances were found, too, where pensioners or widows of deceased employees were living rent-free in company houses.

Special Anthracite Communities.

THE changes in housing in the anthracite-coal region have consisted in remodeling and repairing existing structures. There has been, as already stated, no building of extensive model communities. Two exceptional groups of houses have been built, very largely as an experiment, by one of the larger corporations in the region. These developments, however, have not, because of their limited size, had any very noticeable effect in improving housing. Each group in question contains 40 semidetached dwellings, one group consisting of concrete houses, the other of brick houses. Thus only 40 households are accommodated in each development, whereas at one mine 2,100 men are employed, and at the other 1,500.

Anthracite Community A.

The group of concrete houses consists of 20 semidetached houses or 40 dwellings arranged along the sides of a rectangular area 375 by 430 feet, four semidetached houses facing the short sides and six facing the long sides of the rectangle. Between the rectangular space and the houses there is a roadway about 25 feet wide, graveled and provided with gutters; a strip of parking about 5 feet wide; and a concrete side walk about 4 feet wide. The houses are set about 15 feet back from the sidewalk line. A strip of parking surrounds the whole development.

The central area provides a playground and park space of approximately 3.5 acres. A few trees have been planted here, but at the time the study was made this space had not been developed; it has been used as a playground, though unequipped for this purpose.

The lawns around all of the houses have been exceptionally well maintained; flowers and shrubbery have been tastefully arranged, relieving the plain white painted concrete exterior of the houses. (Fig. 4.) Gardens are planted on the rear lots between the dwellings and the outhouses.

The ground on which the development is located is depressed in the center and rises to form a terrace behind the houses. The lowest point of the site is the northwest corner, from which point drainage is effected. On the whole the drainage situation is not overfavorable and in the spring the cellars of the houses are frequently flooded.

Each dwelling or family unit has a lot 40 by 150 feet.

The shell of the house is made of concrete poured into sectional metal molds, a special patented system. The floors are of reinforced concrete, as are also the stairs, stair casings, and all partitions. The walls are without air spaces. Since coal cinders were used in the concrete aggregate, it was believed that dampness would not develop. This, however, has not been the case. One tenant interviewed complained of dampness. The plaster in the three houses which have been plastered on the inside has peeled off, and the paint both inside and out has blistered in spots, evidencing the condensation and passing of moisture through the walls.

The roof is flat and is made of a concrete slab covered with slag roofing. Rain gutters and down spouts are provided. A small concrete slab is suspended over both front and back doors. Flower boxes are placed on either side of the front doors.

The plan of each dwelling is simple: three rooms downstairs and four upstairs; one of the latter was originally planned as a sleeping porch, but that feature was abandoned as not acceptable to the class of labor to be housed. There is a cellar under part of the house. The outside dimensions of each unit are 24 by 24 feet. Each house is equipped with a water system in the kitchen and a hot-water tank connected to a water back in the range. A combination laundry and bath tub is installed in the kitchen; this may also be used as a kitchen sink. The kitchen is of fair size and is used also as the dining room.

The outhouse is of concrete and contains both the toilet, with a concrete vault, and the coal bin.

These houses were erected in 1911-12 and cost \$2,033 per family unit. The cost for improvements—grading and planting, drainage lines and piping for water system in kitchen, fencing, concrete walks, road work, electric light, etc.—cost about \$456, which brings the cost of each dwelling, not including land, to \$2,489. The outhouses cost about \$68.50 per dwelling.

The houses are rented only to English-speaking workmen. The rate is \$12 a month, which is 5.8 per cent of the investment, not including land. An additional charge of \$1 a month is made for water.

FIRST FLOOR.

SECOND FLOOR.

FIG. 4.—Pictures and plans of group of poured concrete semidetached houses in anthracite region.

FIG. 5.—First and second story plans of modern improved houses—group of 40 dwellings (brick, semi-detached)—built in 1916 in the anthracite region. The water-closet is in the basement (not shown). The combination fixture in the kitchen is used as a bath and laundry tub as well as a sink.

Backyard wire fences are provided by the company; gardening is encouraged by giving prizes. The tenants maintain their own lawns. These were in excellent condition at the time of the agent's visit.

The interior of the house is not so attractive as the exterior. The concrete floors are chilling and uncomfortable. A broken stair coping remains broken, as it seems difficult if not impossible to repair it. No wall finish appears to last long on account of the dampness.

Anthracite Community B.

The same company which erected as an experiment the 40 concrete dwellings described also put up 20 semidetached blocks (40 dwellings) of brick, furred and plastered inside, for the foremen of another of its mines. These houses were built along the curving brow of a hillside overlooking a rather picturesque valley. They are modern houses having such improvements as a water-closet, and a combination fixture in the kitchen adaptable as a two-tray laundry tub, kitchen sink, and drain board, and bathtub. The placing of the water-closet in the basement is rather an undesirable feature. The houses are steam heated. Each dwelling unit has a lot 40 by 150 feet.

These dwellings were erected in 1915-16, and each family unit of seven rooms and a cellar cost \$1,635. The outside improvements consisting of paving and street work, fencing, sewer, septic tanks, water piping, concrete sidewalks, trees and planting, when prorated to each dwelling, amounted to \$526, bringing the cost of each unit of the semidetached block to \$2,161. This is \$328 less per unit than the cost of the concrete semidetached blocks erected in 1911-12 which furnish the same amount of room space, but have neither steam heat nor inside water-closets as do the brick houses described.

The rent for the brick houses is \$12 a month, which is 6.7 per cent on the investment not including the cost of the land.

Plans of these houses are shown in Fig. 5. There are three rooms downstairs and four upstairs; closet space is provided. There are front and rear porches, and rain gutters and down spouts, the latter a very unusual feature on company houses anywhere.

State Aid to Solve Housing Problems in Italy.

BY GOVERNMENT loans to building organizations, cooperative societies, and municipalities, and by exemption of imported building materials from the payment of customs duties, the Italian Government appears to be making an effort to afford relief from the situation caused by lack of proper housing facilities. The United States trade commissioner at Rome, under date of January

15, 1920, submitted to the Department of Commerce the following statement on this subject, which was published in Commerce Reports (Washington) for March 14:

Under the existing provisions, whereby the State participates in the payment of the interest on loans made to building organizations and cooperative societies, the Government has already assumed annual interest charges amounting to about 2,500,000 lire [\$482,500, par], representing loans for building purposes totaling approximately 120,000,000 lire [\$23,160,000, par]. The following municipalities have so far been granted aid by the State in this connection: Milan, Reggio Emilia, Pozzuoli, Caldebesco, Sivignano, and Vezzano, as well as the institutes for popular houses of Catania, Bergamo, Bologna, Florence, Milan, Modena, Rome, Turin, Treviso, and Venice, and various cooperative organizations at Rome, Parma, and Reggio Emilia. Many additional proposals are now under consideration, and a number of local bodies have already begun construction without awaiting the definite allotment of funds from the Government. It is calculated that at this time there are under construction in Italy popular houses the cost of which will exceed 200,000,000 lire [\$38,600,000, par], without including in this sum the construction undertaken at Rome, where the work already under way will provide 25,000 rooms.

Every effort is being made to simplify the formalities connected with the granting of loans, and provision has now been made whereby commercial, industrial, and agricultural organizations can also obtain aid from the State for the construction of houses for their own employees, provided separate accounts are kept in this connection, and the interest derived from their investment does not exceed 5 per cent. Such houses can not be used for any purpose other than that for which they were originally intended. There has been a demand for such aid on the part of certain large industrial establishments, especially at Milan, and it is believed that these companies will now undertake construction on a large scale.

Another stimulus to building activities will consist in the complete exemption from customs duties of building materials imported. The exemption from the normal tax and the supertax will also be considerably extended. Houses coming under the definition of popular or economical houses, as well as popular hotels and dormitories constructed by municipalities and bodies not organized for profit, will enjoy such exemption for 20 years; other houses not belonging in the above classes, but at the same time not of a luxurious character, will be exempt for 10 years, and this exemption may be extended for an additional 15 years.

In addition to encouraging new construction, efforts are being made to assure the most advantageous use of housing facilities already available. By a decree just published, Government commissioners will be appointed in cities possessing over 100,000 inhabitants on December 31, 1919, to see that tenants receive the full protection afforded them by law in connection with the leasing of apartments, furnished rooms, etc., and in regard to evictions. By this decree it is also provided that civil and military offices of the Government, having a temporary character owing to the war, must be removed within three months from private buildings heretofore occupied, and established in temporary buildings which will be constructed. Furthermore, by virtue of a decree of the Ministry of Industry, Commerce, and Labor, buildings intended for use as hotels previous to the war, which have been sold for other purposes but are not yet converted, can be redeemed at the selling price, without further compensation, for their transfer to persons who will use such buildings as hotels and guarantee to continue to make such use of them for not less than 10 years.

From the energetic manner in which the Italian Government is attacking the housing problem there is every reason to believe that a considerable improvement in prevailing conditions will take place within a reasonable period.

LABOR BUREAUS.

The International Labor Office.

THE labor sections of the covenant of the League of Nations provide for a permanent organization for dealing with labor conditions internationally. An international labor conference composed of delegates representing governments, employees, and employers from the several countries belonging to the league, is to meet annually to discuss and pass upon proposals submitted regarding labor standards. A permanent international labor office is also established, with a governing body consisting of 24 members, 12 representing governments and 6 each the employees and the employers. The permanent office staff under the direction of a director and such assistants and heads of divisions as may be found necessary is provided for.

The new international labor office has already been partially organized with Mr. Albert Thomas as director, Mr. H. B. Butler, deputy director, and Mr. Lomercier acting as private secretary, and is in operation with offices at the temporary seat of the League of Nations in London. A periodical bulletin, to be published in French and English and such other languages as the governing body may think desirable, will be issued shortly. In the meantime, the office issues statements of its initial activities to the members of the governing body, the delegates to the Washington conference, and others who are interested in or in sympathy with the work.

The inquiry into Bolshevism projected by the League of Nations is in charge of Dr. Pardo, who has made preparations for the inquiry and the preliminary questions connected with it.

The executive work and preliminary organization of conferences are in the hands of Mr. Phelan and Mr. Pône. Mr. di Palma Castiglione has charge of the study of agricultural problems, and questions relating to seamen are being handled by Commander Crimms of the British mercantile marine.

The first duty devolving upon the international labor office under article 405 of the peace treaty was the official notification of all the governments, through the secretary general of the League of Nations, of the text of the conventions and resolutions which were adopted by the Washington conference. It is also the duty of the international labor office to see that the governments bring the conventions before

their competent authorities within a year, or in special cases within 18 months, with a view to their ratification.

Among other duties of the office is that of the preparation of the agenda for the meetings of the conference and in accordance with this provision an agenda has been prepared and invitations issued for the Seamen's Conference at Genoa, June 15. A questionnaire has been drawn up which, under the terms of the peace treaty, has been forwarded to the governments. Ship owners and seamen's organizations have also been given an opportunity to contribute to the preliminary inquiries as it was considered that this would increase the effectiveness of the conference. The following agenda¹ as adopted by the governing body has been communicated to the different governments:

Agenda for Seamen's Conference.

1. Application to seamen of the convention drafted at Washington last November, limiting the hours of work in all industrial undertakings, including transport by sea and, under conditions to be determined, transport by inland waterways, to 8 hours in the day and 48 in the week.

Consequential effects as regards manning and the regulations relating to accommodation and health on board ship.

2. Supervision of articles of agreement. Provision of facilities for finding employment for seamen. Application to seamen of the convention and recommendations adopted at Washington in November last in regard to unemployment and unemployment insurance.

3. Application to seamen of the convention adopted at Washington prohibiting the employment of children under 14 years of age.

4. Consideration of the possibility of drawing up an international seamen's code.

Other plans of the office include the distribution week by week of information that it has collected on important articles that have appeared in the press of the various countries. It is not the intention to establish a methodical or exhaustive bulletin of the social movement, but rather to send to the employers' and workers' organizations and to the press some of the more important articles dealing with social questions that are published in the various countries.

Examples of such articles already sent out by the office are "The application of the eight-hour day," "A plebiscite on the Swiss bill to regulate conditions of labor," and "Labor conditions in British India." The first article outlines the general provisions of the laws in the different countries and lists the principal exceptions. The Washington conference drew up a draft convention on the 8-hour day which the 41 signatory nations there represented pledged themselves to submit to their parliaments for ratification within one year. This convention which applies to all industrial enterprises—that is, to all factories in which a workman labors for an employer—provides

¹ An article giving the laws and agreements governing working conditions among American seamen, covering in detail the different items of the agenda, appears on pages 1 to 20 of this issue of the REVIEW.

for exceptions for countries in which climatic conditions or the imperfect development of industrial organization would make its application impossible. China, Persia, and Siam are excepted from the convention; Greece and Roumania are granted a certain period in which to put it into operation; and certain special provisions apply to British India and to Japan. The international labor office has supervision of the execution of these measures and will present for consideration at the annual conferences in 1920 and 1921 the question of extending the 8-hour day to seamen, farm laborers, and other industries and occupations.

The Swiss bill relative to the regulation of conditions of labor was to be referred to the people on March 21. The demand for a referendum came from considerably more than the 50,000 citizens necessary before a bill can be submitted to popular vote. The outstanding feature of the bill lies in the fact that it makes compulsory the collective agreements drawn up by a series of official commissions in which workers and employers are equally represented. Great extension of power is given to these official bodies and the opponents of the bill criticize its bureaucratic features and hold that it will subject the entire country to the arbitrary will of a series of commissions over which public opinion will have no control.

Recent Changes in Personnel of State Industrial Commissions.

New York.

THE New York State Industrial Commission, under date of April 19, 1920, announced the appointment of Dr. Leonard W. Hatch as manager of the State Insurance Fund. For the past 12 years Dr. Hatch has been in charge of the Bureau of Statistics and Information of the commission. He brings to the new position close acquaintance with the problems connected with industrial accidents and workmen's compensation in that State from the time of the first New York compensation law to the present. In the field of accident and compensation statistics he is a recognized authority of national reputation. Prior to entering State work Dr. Hatch was for two years a teacher of economics at Columbia University and in Bowdoin College.

Oklahoma.

The State Industrial Commission of Oklahoma has notified this Bureau of the death of its chairman, W. C. Jackson, on April 25, 1920. The vacancy has not been filled.

LABOR ORGANIZATIONS.

Growth of Trade-Union Movement in Belgium.

AN ARTICLE in the *Correspondenzblatt*¹ states that while the Belgian trade-unions survived the war, they emerged from it in a very enfeebled condition. Their coffers were empty and their members were almost entirely unemployed. The turmoil of the war drove the workers from one place to another and it was impossible for the trade-unions to keep in touch with them. By degrees the membership declined to the 1902 figure, but the organizing staff remained intact and its hopes of better times in store were fulfilled with the signing of the armistice. The unions issued an appeal to their members and expressed their firm determination to obtain an 8-hour day and a minimum wage of 1 franc (19.3 cents, par) per hour. The appeal was not without effect on the underpaid or unemployed masses. Everywhere members joined the 8-hour-day movement, though it must be conceded that they were largely induced to join by the promise of the unions to give financial support to workers who declined to work more than 9 hours a day and for less than 1 franc per hour.

The result has been a large addition to the trade-unions' membership. In 1913 the total membership was 128,759; in 1919 it had increased to 613,500. The following table shows the numerical strength of the various unions.

MEMBERSHIP OF BELGIAN TRADE-UNIONS, 1913 AND 1919.

¹ *Correspondenzblatt der Generalkommission der Gewerkschaften.* Berlin, Jan. 17, 1920.

Amsterdam Conference of International Union of Woodworkers.

THE fourth conference of the International Union of Woodworkers, the first after the end of the war, was held at Amsterdam December 8-10, 1919.¹ It was attended by 27 delegates from 12 different countries (France, England, Belgium, Luxemburg, Austria, Bulgaria, Germany, Denmark, Sweden, Norway, Holland, and Switzerland), representing 23 affiliated organizations. All delegates seemed to be animated with the earnest desire to heal the wounds inflicted by the war, to mend what had been broken. So great was the desire of the delegates to rebuild the International Union within the shortest time possible and to turn it into an organization for the welfare of the woodworkers all over the world, that the discussion on all items led to unanimous decisions.

It was resolved to remove the headquarters of the International Union to Amsterdam. The former secretary, Leipart, resigned owing to his appointment as minister of labor of Wurttemberg, and C. Woudenberg was elected secretary. The conference appointed a commission charged with the drafting of a new constitution and rules for the union. The contributions were fixed by the conference at 15 guilders (\$6.03, par) per 1,000 members, from January 1, 1920, at the prewar rate of exchange. The secretary reported that at present the union had a debt of 8,000 marks (\$1,905.60, par) owing to the fact that a number of organizations were not in a position to meet their financial obligations during the war. The conference resolved that the arrears should be paid.

The conference adopted the following resolutions:

1. *Declaration of principle.*—*Resolved*, That peace between the nations and entire emancipation of the working classes of all countries can be effected only by the complete understanding and serried unity of all nations. This unity will have to be supported by an energetic action in all countries of all trade-unions against militarism and for the abolishment of the standing armies. Only capitalism is interested in the maintaining of armies and navies. Consequently the working classes all over the world must more than ever make their utmost exertions to overthrow the capitalist system and create a society wherein exploitation of man by man will have disappeared and where labor will be honored and dominative.

These general considerations being admitted, the conference states with great satisfaction that in the Woodworkers' Union the ancient brotherhood has been restored.

The conference registers that between the woodworkers of those countries belonging to the union hostility or distrust do not exist any more and calls upon the woodworkers of all countries to join the international combination in order to fight upon a united front for the mutual interests.

2. *The blockade of Russia.*—*Resolved*, That the International Conference emphatically protests against the blockade of Russia and calls on the national sections to use

¹ Bulletin der Internationalen Union der Holzarbeiter, No. 1/17. Amsterdam, January, 1920.

their utmost exertions together with the other organizations in their countries so as to bring to bear influence upon the governments of their countries in order immediately to stop all intervention which is an attack upon the right of self-determination of all nations.

The conference hails with delight those workers who with a firm conviction attack the capitalist citadel, with the aim of founding a social democracy.

The conference declares that the woodworkers of all countries, by working for the socialization of all trades and industries, will also contribute to the abolishment of social contrasts so that peace between the nations will be attained and assured.

3. *Prisoners of war.*—*Resolved*, That the members of all organizations represented in the conference demand the release of German and Austrian prisoners of war in France. The conference protests against the fact that this release has not yet taken place.

4. *The distress in Austria.*—The International Conference considering that the population of Austria is suffering very much expresses its sympathy and calls on its members to support all measures, moral as well as financial, which may contribute to saving Austria from starvation.

Resolutions 2 and 3 were transmitted to the Supreme Allied Council.

STRIKES AND LOCKOUTS.

Strikes and Lockouts in Canada in 1919.

A REVIEW of strikes and lockouts occurring in Canada during the year 1919 is contained in the March issue of the Labor Gazette (Ottawa). It is stated that both the number of disputes and the time lost were the greatest in the history of the Department of Labor. There were 298 strikes and lockouts which started in 1919, eight being carried over from the preceding year. The number of employees involved was 138,988, and the number of employers was 1,913; the total number of working days lost was estimated at 3,942,189. For statistical purposes, only those strikes and lockouts which involved a cessation of work by six or more employees for a period of not less than 48 hours are counted. The report states that in about 90 per cent of the strikes not more than 1,000 persons were involved, and in about 34 per cent of the strikes not more than 50 employees were involved.

As to duration, 44 per cent of the strikes lasted for more than 10 days; 55 per cent were under 15 days' duration; and about 20 per cent lasted more than 30 days. The following table gives the number of industrial disputes, the number of workpeople involved, and the number of days lost, by industry:

NUMBER OF DISPUTES, NUMBER OF WORKPEOPLE INVOLVED, AND NUMBER OF DAYS LOST IN STRIKES IN CANADA IN 1919, BY INDUSTRY.

Industry.	Number of disputes.	Number of employees involved.	Time loss.	
			Working days.	Per cent of total.
Lumbering.....	21	4,127	100,785	2.6

Public utilities.....	10	1,657	39,716	.8
Municipal employment.....	7	563	2,434	.1
Miscellaneous.....	22	4,069	50,754	1.2
Total.....	298	138,988	3,942,189	100.0

Classified by cause, the report lists 223 of the 298 strikes as due to demands for increases in wages and for shorter hours, or as due to reduction in wages. The record shows that 157 terminated in favor of employees and 88 in favor of employers; 23 were compromise settlements, while 30 were indefinite and unterminated. Direct negotiations between the parties resulted in the settlement of 154 strikes, while conciliation or mediation by the Department of Labor terminated 41 strikes.

Strikes of Italian Government Employees.¹

Compiled by ALFRED MAYLANDER.

SINCE the termination of the war Italy, in common with other countries, has experienced extensive labor unrest. During 1919 strikes of varying duration in the textile, iron and steel, electrical, and other important industries were an everyday occurrence. Nearly all these strikes had a strictly economic character, being caused by demands for wage increases proportionate to the steadily increasing cost of living and for a shorter working day, i. e., the 8-hour day. Only in a few of the industrial strikes were the economic demands coupled with a demand for shop councils. The Italian Government showed its solicitude for improving the economic conditions of the working classes by creating a well-planned system of employment exchanges, by granting generous unemployment allowances, by developing its social insurance system (through the introduction of compulsory old-age, invalidity, and unemployment insurance), and by enacting numerous protective labor laws. The Government failed, however, in its attempts to lower the cost of living, the chief cause of the present labor unrest. Italian exchange fell steadily in foreign money markets and with this fall of exchange the cost of living rose to new heights, for Italy, in common with other European countries, must to-day largely obtain from abroad its supply of foodstuffs, raw materials, and coal.

Thus, the unrest of labor, instead of abating, grew more intense at the beginning of the present year, and, while previously confined to workers in private employment, it now began to spread also among the vast army of workers in the employment of the State. In January, 1920, the employees in the postal, telegraph, and telephone services and those in the operating departments of the State railroads made demands for large wage increases, improved service conditions and participation in the administration. In both instances these

¹ Compiled from various articles on the subject in January, 1920, issues of the *Giornale d'Italia* of Rome and *Il Secolo* and *Corriere della Sera*, both of Milan.

demands were initiated by organizations of radical socialistic tendencies with which only a small minority of the employees was affiliated. The Government entered into negotiations with committees of the employees' organizations, but while willing to make far-reaching concessions in order to avoid a strike in the communication and transportation systems of the country which would paralyze all industry and commerce and seriously affect the food supply, it could not see its way to granting unconditionally all the demands of the employees. It emphasized that, in view of the heavy indebtedness of the State, a wage increase requiring an additional annual expenditure of hundreds of millions of lire would further impair the greatly strained credit of the State at a time when a new issue of bonds was being offered for subscription, and would also tend to lower still more the rate of exchange, which in turn would cause a further rise in the cost of living. For all these reasons the Government declared itself unwilling to ask Parliament to grant such large increases as were demanded by the employees. It was also strongly opposed to the political demand of the employees for representation on the administrative boards of the services and resented the accusation of inefficiency of these boards as composed at present. In this attitude the Government was strongly supported by public opinion and by the metropolitan press, with the sole exception of the organs of the Socialist Party. The Government also hoped that the unlawfulness of a strike of public servants and the disciplinary measures provided in the civil-service regulations for participation in a strike would deter the employees from taking part in such a movement. But it was mistaken in this belief, for after an abrupt breaking off of negotiations a strike was called by the lower-grade employees of the postal, telegraph, and telephone services, and a week later, before this strike had terminated, the railroad men also went on strike.

A brief account is here given as to the demands of the workers in both of these strikes, the negotiations preceding the strikes, the course of the strikes, and their final settlements.

Strike of Postal, Telegraph, and Telephone Employees.

Situation of Employees Before the Strike.

UP TO January, 1919, the salaries of employees of the postal and telegraph services had practically remained on the prewar basis. At the end of the winter of 1918-19 the central committee of the Federation of Postal and Telegraph Employees submitted to the minister of posts a memorial in which, in addition to a number of demands relating to service conditions, it was demanded that the minimum annual salary of employees of group 3 (clerks, letter carriers,

messengers, etc.) should be raised to 3,500 lire (\$675.50 par), that of employees of group 2 (administrative officers) to 4,500 lire (\$868.50 par), and that of employees of group 1 (higher officers with a university degree, so-called *segretari*) to 5,000 lire (\$965 par). Through agitation and by adoption of passive resistance during the Christmas season of 1918 the employees had obtained an increase of 600 lire (\$115.80 par). A threat of strike in April, 1919, brought them a temporary bonus of 1,200 lire (\$231.60 par), which was granted to all Government employees without distinction. The minister of post, after consideration of the memorial of the employees' federation, prepared a new salary schedule and new service regulations for submission to the Council of State and to Parliament, but before he could submit this proposal the entire cabinet resigned. The new minister, after examining the reforms proposed by his predecessor, entered into lengthy negotiations with the employees' federation which centered around the salary demands, and together with the prime minister and the minister of finance, finally declared to the federation that the salaries of Government employees had been fixed on a uniform basis for all Government departments by a special royal commission of seven previously appointed and that no change could be made in favor of the postal, telegraph, and telephone employees, as this would mean unfair discrimination against employees of other departments. In view of this incontestable declaration the federation had to content itself for the time being with concessions of a few disciplinary and organic reforms.

Three months later, however, the declaration made by the ministry was disproved by a decree of December 6, 1919, which granted to all classes of Government employees an annual increase of 1,000 lire (\$193 par), but specially excluded from this grant the postal, telegraph, telephone, and railroad employees. An inquiry as to the cause of this discrimination elicited the reply that owing to the large number of employees in the postal, telegraph, telephone, and railroad services and the unfavorable condition of the State's finances no increase could be granted to employees of these services without the approval of Parliament.

Final Demands of the Employees.

On January 8, 1920, a committee of the employees' federation, accompanied by members of the Lower House of Parliament representing all political factions, presented to the minister of posts the following demands: (1) Revision of the basic salary schedules and their equalization with those for other Government departments; (2) increase of compensation for overtime and night work, this increase to correspond to the increased cost of living; (3) extension of the

premiums for intensive work to all the personnel of the postal, telegraph, and telephone service; and (4) revision every three months of the cost-of-living bonus.

On January 10 the minister of posts replied to the demands of the federation by offering the following concessions:

Employees of group 1.—The basic salaries to be equalized to those in other Government departments.

Employees of group 2.—Chiefs of offices (*capi-ufficio*): Minimum salary, 5,600 lire (\$1,080.80, par); after 4 years' service, 6,200 lire (\$1,176.60, par); after 8 years, 6,900 lire (\$1,331.70, par); after 11 years, 7,600 lire (\$1,466.80, par); and after 14 years, 8,300 lire (\$1,601.90, par). Chief clerks and higher grade officers (*primi ufficiali, ufficiali*), etc.: Minimum salary, 3,500 lire (\$675.50, par); after 4 years' service, 4,000 lire (\$772, par); after 10 years, 4,500 lire (\$868.50, par); then through 7 promotions of 500 lire (\$96.50, par), each rising to 8,000 lire (\$1,544, par). Special officers (*applicati*): Minimum salary, 3,000 lire (\$579, par), then through 7 promotions of 300 lire (\$57.90, par), every 4 years, rising to 5,100 lire (\$984.30, par), and after a further 4 years to 5,500 lire (\$1,061.50, par).

Employees of group 3.—Clerks: Minimum salary, 2,800 lire (\$540.40, par) rising to a maximum of 5,400 lire (\$1,042.20, par) through 4 promotions at 3-year intervals and 3 further promotions at 4-year intervals.

Messengers and female clerks: Minimum salary 2,400 lire (\$463.20, par), rising to 3,000 lire (\$579, par) through 3 promotions at 4-year intervals of 200 lire (\$38.60, par) each, and thereafter rising to 3,600 lire (\$649.80, par) through 2 promotions at 4-year intervals of 300 lire (\$57.90, par) each.

Overtime: For officials the compensation to be increased from 1.25 to 2.25 lire (24.1 to 43.4 cents, par) per hour and for other employees from 0.75 to 1.25 lire (14.5 to 24.1 cents, par) per hour.

Nightwork: The extra compensation for work from 8 p. m. to midnight to be raised to 0.70 lire (13.5 cents, par) per hour and for work from midnight to 7 a. m. to 1 lire (19.3 cents, par) per hour.

Acting officers performing the duties of statutory officers to be promoted to full rank, retroactive to January 1, 1918.

The representatives of the federation declared themselves not satisfied with these concessions and submitted them to the national convention of the federation held in Rome on January 11. At this convention of the federation, held jointly with the linemen's union and the union of employees of group 3, it was resolved to reject the proposals, to dissolve the central committee of the federation, and to appoint a secret strike committee. It was asserted that the wage increases demanded would not exceed 35,000,000 lire (\$6,755,000, par), that the increase demanded by the postal, telegraph, and telephone employees represented an irreducible minimum, and that the minister had not granted in full a single one of the four demands of the federation.

The Strike.

During the temporary absence from Rome of the minister of posts, the strike committee of the federation, which had assured itself of the support of the General Federation of Labor, called a strike of postal,

telegraph, and telephone employees in the entire country to go into effect at midnight of January 13. Even on its first day the strike was very effective. All of group 3 of the postal and telegraph employees, which includes those employees who perform the collecting, assorting, and delivery of the mails, responded to the call. Group 2, which includes the medium salaried employees, responded in part, the members of a rival union, the Associazione Sindacale Posteografica having voted not to strike. Of the employees of the central administration about 40 per cent reported for duty. The union of substitute receiving clerks of the postal and telegraph stations also decline to order a strike and instructed its members to continue at work. The telephone service was greatly impaired, large numbers of the female employees not reporting for duty. Their absence was due less to a feeling of solidarity with the strikers than to intimidation.

In the absence of the minister of posts, the undersecretary of the department issued an order limiting the mail service, while the telegraph service was closed to the public and the press, and only official messages were dispatched. Interurban telephone service was also limited to official messages.

The public, which was greatly inconvenienced through the strike, sided strongly with the Government. Although admitting that the economic conditions of the striking employees required improvement, the public took the point of view that the ministry had met in great part the demands of the employees and that the latter should have placed their cause in the hands of Parliament. The ministry of posts received numerous offers of service from private citizens, students of the high schools, and retired post office and telegraph employees who offered to act as mail collectors, letter carriers, messengers, etc. The aeronautic branch and the signal service of the army were also ordered to assist the postal authorities. The large financial and industrial establishments in a number of large cities established an emergency mail service of their own. A few striking employees returned to work because they were disgusted with the revolutionary speeches made at strikers' meetings, but on the whole the strikers' ranks maintained a solid front.

During the entire period of the strike the Government and the striking employees engaged in animated discussions in the daily press. The Government put forth the argument that before the war the postal, telegraph, and telephone services were a source of revenue to the State, while now these services were operated with a large deficit, and that in view of this fact and the serious condition of Italian State finances the demands of the employees could not be granted in full. The employees, on the other hand, contended (1) that the fact that the operation of a Government establishment results in a

deficit does not furnish a valid reason for refusing a wage increase to underpaid employees of this establishment; (2) that the deficit of public industrial establishments is largely due to inefficient administration; and (3) that efficient administration could be brought about by the creation of equipartisan administrative boards composed of representatives of industrial and commercial organizations on the one hand and representatives of the various groups of Government officials on the other. These contentions of the striking employees found support in some of the most influential papers.

Termination of the Strike.

On January 19, while the strike of the postal, telegraph, and telephone employees was still in effect, the railroad employees called a general strike. As the Government did not care to have simultaneously on hand two strikes of Government workers and as the railroad strike deprived the central strike committee of the postal, telegraph, and telephone employees of all means of communication with the branch committees, both the Government and the postal, etc., employees were inclined to enter negotiations. The Government gave assurances that no disciplinary measures would be taken against the strikers, agreed to pay their salaries during the strike, and promised to reconsider all the demands of the strikers. Accepting these assurances, the central strike committee called off the strike on the night of January 20 and on the following day all strikers returned to their work. In calling off the strike the committee, however, pointed out that this action had merely the significance of a truce, that the workers trusted in the good faith of the Government and expected full compliance with their original four demands, and, that, if the Government should fail to live up to the assurances given, the strike would be renewed.

The Railroad Strike.

Demands of the Syndicalistic Union of Railroad Employees.

IN SPITE of the fact that, although passenger and freight rates had been doubled during the war, the operation of the Italian State railways during the year 1919 had resulted in a deficit of 400,000,000 lire (\$77,200,000, par), a syndicalistic union of railroad employees, *Il Sindacato Ferrovieri Italiani*, initiated at the end of that year a movement for wage increases and for participation in the management of the railroads. One of the main causes of the deficit was the enormous increase in the wage bill of the railways, which had risen from 300,000,000 lire to 1,000,000,000 lire (\$57,900,000 to \$193,000,000, par).

The railway men were better paid than any other class of Government employees. Locomotive engineers, for example, were in re-

ceipt of salaries much higher than those of judges, division chiefs of Government bureaus, or staff officers in the army and navy. To be sure, the cost of living in Italy had risen over 200 per cent as compared with prewar times and the high salaries of railroad men had a greatly reduced purchasing value, but so had the much lower salaries of other classes of wage workers. Yet, during the first week of January the *Sindacato* presented to the minister of transport a memorial which had the character of an ultimatum, for it intimated that a general railroad strike would be called unless the demands of the railroad men were granted by January 15. The demands incorporated in the memorial were the following:

1. A more rational reclassification of the operating departments of the railroads (re-arrangement of classes, grades, and qualifications of the personnel).
2. Abolition of probationary service.
3. Fairer and more efficient rules for the hiring, competitive examinations, and promotion of employees, increases of basic wages and allowances, and representation of the employees on all boards deciding questions relating to the personnel.
4. Transfers not to be dependent on the patronage and arbitrary will of superiors.
5. Revision of the disciplinary regulations, with substitution of several grades of reprimand for fines.
6. Abolition of promotions out of turn, which it was claimed had generally been granted as premiums for servility and abjectness.
7. Abrogation of article 56 of the law No. 429 of 1907 which provides dismissal and loss of pay of striking railroad employees.
8. Eligibility of railroad employees to political offices.
9. Strict enforcement of the 8-hour day and of the weekly rest period with respect to all classes of employees.
10. Participation of the employees in the local railroad commissions and in the division and central administrative boards through representatives elected from among the members of the *Sindacato Ferrovieri*.

The following schedule of minimum and maximum salaries demanded by the various groups and classes of employees was appended:

MINIMUM AND MAXIMUM SALARY RATES OF ITALIAN RAILROAD EMPLOYEES AS DEMANDED BY THE *SINDACATO FERROVIERI* IN JANUARY, 1920.

[One lira at par=19.3 cents.]

Group and class of employees.	Annual salary.	
	Minimum.	Maximum.
<i>Office staff.</i>		
Principal clerks, storehouse superintendents, principal auditors, principal technical clerks, chief draftsmen.....	<i>Lire.</i> 10,000	<i>Lire.</i> 12,500
Clerks, first class, auditors, technical clerks, first class, principal draftsmen, principal technical assistants.....	7,400	11,300
Clerks, technical clerks, draftsmen, technical assistants.....	6,800	7,400
Principal typist stenographers (female).....	7,000	10,000
Typist stenographers (female).....	5,600	7,000
Document file clerks.....	6,800	9,700
Copyists, first class.....	6,200	9,400
Copyists.....	5,800	6,200
Chief messengers.....	6,800	9,700
Messengers, first class.....	6,600	8,600
Messengers.....	5,800	6,000
Servants, attendants.....	5,400	8,200

MINIMUM AND MAXIMUM SALARY RATES OF ITALIAN RAILROAD EMPLOYEES AS
DEMANDED BY THE SINDACATO FERROVIARI IN JANUARY, 1920—Concluded.

Group and class of employees.	Annual salary.	
	Min- imum.	Maxi- mum.
<i>Station staff.</i>		
Station masters, first class.....	11,700	13,200
Assistant station masters, first class, and chief telegraphers.....	11,500	13,000
Station agents.....	7,800	11,700
Assistant station agents and principal telegraphers.....	7,600	11,500
Dispatchers.....	7,100	11,700
Probationary clerks.....	5,400	
Clerks, first class.....	7,000	10,900
Clerks.....	6,200	7,000
Agents at flag stations, first class.....	7,000	10,900
Agents at flag stations.....	6,600	10,500
Rolling-stock foremen and chief switchmen.....	8,800	10,500
Chief assistant freight agent, chief waiting-room guards.....	6,200	9,400
Assistant freight agent, waiting-room guards.....	6,000	9,000
Rolling-stock gang foremen, switchmen foremen.....	6,400	9,400
Rolling-stock handlers, switchmen.....	6,000	9,000

Master mechanics.....	8,600	11,700
Chief testers, chief foremen.....	8,000	11,700
Testers, foremen.....	7,000	11,300
Skilled workers, first class.....	7,000	10,900
Skilled workers, second class.....	6,600	10,100
<i>Archives.</i>		
Chief and assistant chief keeper of records.....	10,100	12,300
Keeper and assistant keeper of records.....	7,400	11,300
Clerks, first class.....	7,400	11,000
Clerks.....	7,000	9,400

A study of the preceding table shows that it does not include high administrative officials, who certainly also deserved salary increases if increases were to be granted to the employees of medium and low rank. But even if the high officials are left out of consideration, the salaries proposed for employees of medium and low rank represent such a large increase over present salaries that the granting of them would involve a further burdening of the State budget to the amount of 750,000,000 to 800,000,000 lire (\$144,750,000 to \$154,400,000, par). Moreover, the salaries proposed, although including the high-cost-of-living bonus, computed at 1,200 lire (\$231.60, par), and a number of other allowances, do not include the local allowance (*sopprassoldo di localita*) granted to each employee, which is based on the size of the locality in which he resides. This allowance at the time amounted to about 10 per cent of the salary and could never exceed 840 lire (\$162.12, par) per year. According to the demands of the Sindacato this allowance would vary between a minimum of 500 lire (\$96.50, par) and a maximum of 2,000 lire (\$386, par). In addition the Sindacato demanded the granting of a family allowance of 1 lira (19.3 cents, par) per day for each dependent member of the family of each employee, who is living in his household.

The Italian press condemned the economic as well as the organic and political demands of the railroad employees as preposterous. It pointed out that the present condition of the State finances precludes even the considering of the enormous salary increases demanded in the memorial, and that the granting of such large increases to the railroad employees would mean gross discrimination against other less well remunerated classes of Government employees. The demands as to abolition of fines and of promotions out of turn for merit would lower the morale and efficiency of the personnel. Concerning the demand for representation of the employees on the administrative board of the railroads, the press pointed out that even if the Government should grant this demand, the Sindacato Ferroviieri practically demands a monopoly of this representation, although over half of the railroad employees belong to no organization at all and a considerable number of the organized employees are members of other organizations. Thus, the Sindacato Ferroviieri, representing merely a majority of the organized employees, wanted the Government to ignore and suppress the unorganized employees and the minority organizations.

Reply of the Government.

Shortly after receipt of the memorial of the Sindacato Ferroviieri a cabinet council discussed the demands of the railroad employees. The cabinet, in a statement given out on January 10, showed great

inclination to conciliate the railroad employees by far-reaching concessions. The text of this statement was as follows:

In its recent sessions the cabinet council, while examining the situation of the railroad employees, has resolved to admit three representatives of the personnel as members of the administrative board of the railroads. These three representatives shall for the first time be elected by direct vote of the employees, and, in order that the minorities be also represented, the ballot used shall contain two tickets. The administrative board thus constituted shall—

(a) On the basis of concrete proposals and at the earliest possible date draft a law recognizing the organizations of railroad employees and providing for their proportionate representation on the board itself, the representatives thus elected to supplant the above three representatives;

(b) Draft new basic schedules to be submitted for the approval of Parliament, these schedules to provide for reduction of the present personnel, the simplification of the service, and such other measures as are required to assure a normal financial return from the operation of the railroad.

(c) Put into effect the 8-hour day and the weekly rest, in the first place in the case of those groups of employees who would have been granted the 8-hour day during December of last year, and gradually within the year 1920 for all other groups of employees.

The cabinet council, in consideration of the fact that the preparation of the new basic schedules will require some time, has authorized the minister of finance to make an extraordinary disbursement of 100,000,000 lire (\$19,300,000, par) which shall be expended as follows:

(a) Five million lire (\$965,000, par) for subsidies to railroad employees' cooperative stores.

(b) Five million lire (\$965,000, par) for premiums to temporary employees who have been in continuous service over one year—gatekeepers and freight-house watchmen.

(c) Ninety million lire (\$17,370,000, par) to be distributed in two equal payments payable at the end of January and of February, to permanent and probationary employees.

On January 15 the minister of transport officially informed the Sindacato of the above concessions by the cabinet council, also informing them that all employees would receive two premiums, one payable at the end of January and one at the end of February, the subsidy in the case of permanent employees to amount to 300 lire (\$57.90, par), in the case of temporary employees to 100 lire (\$19.30, par), and in that of gatekeepers to 50 lire (\$9.65, par).

Thus the Government was willing to grant some of the most important demands of the employees, such as representation on the administrative board and the 8-hour day. The demand for salary increases is met half way by the immediate grant of a subsidy and by the proposed submission of a new salary schedule to Parliament.

Rejection of the Government's Concessions.

In view of the conciliatory attitude of the Government it should reasonably have been expected that the railroad employees would accept the immediate concessions made to them, await the action of the administrative board and of Parliament with respect to the prom-

ised new salary schedule, and desist from calling a strike. But as in other industrial disputes the agitation of a small radical minority prevailed.

Of the 167,000 railroad employees in Italy about 67,000 are organized and the remaining 100,000 are not organized. The organized employees are distributed among three organizations, besides the *Sindacato Ferrovieri*. These three other organizations, with a total membership of 27,000, were opposed to a strike and willing to accept the concessions made by the Government. As regards the 100,000 unorganized employees it may be safely assumed that they also were not in favor of a general strike. Only the *Sindacato Ferrovieri* resolved to reject the Government's proposals and to call a general strike. Thus only 40,000 out of a total of 167,000 employees, or less than one-fourth, precipitated a tie-up of the Italian railroads.

The Strike.

On the evening of January 19, at a meeting held in Rome and attended by about 3,000 railroad employees, a general strike was called by the *Sindacato Ferrovieri*, to become effective on January 20 at 6 a. m. Simultaneously with the calling of the strike by the *Sindacato* the other organizations of railroad employees issued a joint proclamation condemning the action of the *Sindacato* and appealing to their members to continue at work.

The Government had been expecting that a strike would be called and had taken extensive measures to maintain a train service between all important centers. In anticipation of the strike it had moved large supplies of food, fuel, and raw materials to all large cities. The strike was not so successful as the *Sindacato* had hoped. Barely one-third of the men went on a strike, but as the strikers included the majority of the locomotive engineers, firemen, conductors, and brakemen, traffic was badly crippled. The strike was most intensive in the northern districts; in the central districts it was only partial; and in the southern districts and Sicily traffic was nearly normal.

The Government ordered the temporary employees to return to work by a certain date, but it was not until the strike had been going on for seven days that a similar order was issued to the permanent employees. Although daily reports received by the ministry of transport indicated greatly improved traffic conditions and showed that the strike was a failure, the Government entered into negotiations with the strikers' leaders. The *Sindacato* receded from its unreasonable demand that it should be the sole representative of the employees on the administrative board, and since most of the other demands of the employees had been granted by the Government before the strike, the only question to be settled was whether the strikers should be paid wages for the time they were absent from

work, and whether the promotions of the men who remained at work should be canceled. On January 29 the Government concluded an agreement with the strikers the principal clauses of which were as follows:

1. All employees who have taken part in the strike will be reinstated in their former positions.

2. The pay of the striking employees accrued during the period of the strike shall be deducted from their salaries and paid into the railroad employees' housing fund by the Government.

3. Reaffirming the principle of the 8-hour day for all workers in private and State industries, the 8-hour day shall be actually introduced not later than April 30 for all engine crews, not later than June 30 for all train crews, and at the earliest possible date for all other railroad employees.

4. Regulations for the introduction of the 8-hour day shall be discussed and issued by the administrative board, to which shall be admitted in an advisory capacity three members of each of the eight groups of employees, these members to be elected by the groups themselves, with proper representation of the minorities.

5. The administrative board shall draft salary schedules in which shall be included premiums and allowances, with the exception of the cost-of-living bonus. These schedules shall be submitted by the Government to Parliament, together with the memorial of the *Sindacato Ferrovieri*.

6. The railroad employees shall, with recognition of the minorities, elect five members of the administrative board. In drafting the new service regulations the administrative board shall make provision for the establishment of local commissions.

The *Sindacato*, which on January 30 itself ordered the men to resume work, completely failed to make the strike universal, and obtained no concessions that had not already been granted. In spite of a few isolated attempts at sabotage, it provoked no revolutionary demonstrations, and failed to induce any other bodies to declare a sympathetic strike. The Italian nation was the real loser by the strike, for the financial loss caused to the State ran into hundreds of million of lire. Masses of perishable goods were ruined, and the rate of exchange of the lire experienced a further sharp decline.

CONCILIATION AND ARBITRATION.

Conciliation and Arbitration in New Zealand.

A PAMPHLET bearing this title has been issued by the National Industrial Conference Board.¹ This study is put forth as a review of the experience of New Zealand, which covers the longest period of any country for this type of legislation. The act of 1894 provided for the principles of conciliation and arbitration at a time when the country was but little developed industrially, so that almost the whole history of its development has taken place under the influence of this law. While conciliation is a vital part of this system, the principle of arbitration gives it its background and effectiveness. "The former method, both in theory and in practice affords an opportunity for differences to be completely or partly settled. The latter secures the final adjustment of any unsettled elements of the dispute and the enforcement of the agreement upon all, both employers and workers, engaged in the industry."

The first consideration is of the development of the system, which involved as an essential factor the existence of labor organizations. Indeed the subtitle of the act of 1894 was "an act to encourage the formation of industrial unions and associations." Conciliation was to be effected by boards made up of representatives of industrial unions of employers and workers respectively, in equal numbers, the chairman to be elected by the membership from outside their number. In case of failure of agreement a court of arbitration was resorted to. This was to consist of three persons, one of whom was to be a judge of the supreme court. Amendments and revisions have been made from time to time, various consolidations being made, that of 1908 being the existing law, though subsequent amendments have been added. The report summarizes these various amendments. Important among them are the provisions for preferential treatment of union members and the imposition of a penalty for strikes or lockouts pending the disposition of a dispute. It is also provided that disputes may go directly to a court of arbitration without prior attempts at conciliation. In 1908 conciliation boards were abolished and councils substituted therefor. Industrial commissioners were assigned to districts, and, when a dispute is referred to one of them, he obtains the names of suitable "assessors" from both sides and from

¹ Conciliation and arbitration in New Zealand. Research report No. 23, December, 1919. National Industrial Conference Board, Boston, Mass. 46 p.

the industry in which the dispute exists. This involves the formation of a new council for each dispute. While the original principle of the system is unchanged by the amendments, there is a tendency to give more definiteness and effectiveness to the processes involved and to penalize all activities tending toward or creating either strikes or lockouts.

The number of employer unions grew from 121 with a membership of 3,630 in 1907 to 149 with a membership of 5,819 in 1914; in 1917 there were 145 with 5,390 members. Workers' unions showed a similar fluctuation, there being 310 with a membership of 45,614 in 1907 and 403 with a membership of 73,991 persons in 1914; in 1917 there were 382 unions with 72,873 members. These organizations lie at the foundation of the administrative methods. Employees are protected in their membership, and awards are binding upon every employer engaged in the industry covered by the awards, and upon every worker employed by such employer. Penalties lie against either party committing a breach of the award. Each award names a minimum wage which is generally a compromise between the demands of the union and the offers of the employers. In practical working this minimum wage does not dominate. "In our manufacturing industries at least an average of 50 per cent of the workers received more than the rate granted in the awards of the court of arbitration."

A labor disputes investigation act, modeled after the Canadian act, was provided in 1913, and this affords additional machinery for the investigation of disputes. This applies only to groups of workers not at the time bound by awards or industrial agreements, and to the employers of such workers. It provides a penalty for strikes or lockouts until after due notice or time for investigation, and also during the term of any agreement.

The proportion of disputes settled by conciliation and by arbitration has varied considerably at different times, though the average total shows a practically even distribution—49.7 per cent for conciliation and 50.3 per cent for arbitration. The ratio was practically one to two from 1894 to 1901, 1 to 17 from 1902 to 1908, and two to one from 1909 to 1918. During the first 12 years of existence of the act there were no strikes whatever, and the total reported from 1894 to 1918 inclusive was 169. Most of these took place in the years 1911 to 1914, inclusive, 46 occurring in the last year alone. The next year this number dropped to four, and in the three succeeding years there were 7, 8, and 6 strikes, respectively.

The number of these strikes, though comparatively small, is sufficient proof that the system has not given universal satisfaction. At times the employers complain and at other times it is the workmen who give expression of a sense of grievance. Prosecution has been

necessary to enforce awards, there being 69 prosecutions in 1911 and 50 in 1913. The next highest number is 17 in 1917 while in 1915, 1916, and 1918 none were found necessary. In summing up, it is said that the system, "while by no means curing industrial unrest, has shown the value of conciliation as a means of settling industrial disputes and preventing them from becoming more serious." The attitude of the courts has tended to check unreasonable demands, and "it must be borne in mind that the efficacy of conciliation may be attributable in part to the existence of the principle of compulsory arbitration, which might easily make the two parties more disposed to compromise, on grounds of expediency, if for no other reason."

PUBLICATIONS RELATING TO LABOR.

Official—United States.

CALIFORNIA.—*State Board of Education. Documents relating to vocational education. Fiscal year 1919-20. Sacramento, 1919. 80 pp. Bulletin No. 23-A.*

— *State Library. Books for the blind. Circular and finding list. Fifth edition. Sacramento, July 1, 1919. 139 pp.*

ILLINOIS (CHICAGO).—*Department of Health. Report and handbook for the years 1911 to 1918, inclusive. Chicago, 1919. 1,535 pp.*

The report of the bureau of sanitation, which is of special interest to labor, is in five parts, devoted respectively to History of the bureau, Administrative and inspection methods, Division of plumbing and new buildings, Division of housing and sanitation, and Division of ventilation. The report of the last division considers, among other matters, ventilation standards, the effect of ventilation on health, and administrative and inspection methods employed by the division, and suggests that the division should be reorganized on an engineering basis and its scope broadened to include those features in health conservation that are clearly of an engineering nature, namely: Heating, ventilation, illumination, and industrial hygiene.

MARYLAND.—*Industrial Accident Commission. Fifth annual report. November 1, 1918, to October 31, 1919. [Baltimore, 1920.] 27 pp.*

This report is reviewed on pages 166 and 167 of this issue of the MONTHLY LABOR REVIEW.

NEW YORK.—*Industrial Commission. Bureau of Industrial Code. Rules relating to work in compressed air. New York, 230 Fifth Avenue, 1920. 16 pp. Industrial Code Bulletin No. 22.*

VIRGINIA.—*Industrial Commission. First annual report for the year ending September 30, 1919. Richmond, 1920. 121 pp.*

A digest of this report is given on pages 168 and 169 of this issue of the MONTHLY LABOR REVIEW.

UNITED STATES.—*Department of Commerce. Report of the secretary and reports of bureaus, 1919. Washington, 1920. 1,071 pp.*

Subjects of interest to labor considered in the report of the secretary are the use of motion pictures in industry, superannuation and retirement, and the work of the industrial board and the industrial cooperation service of the department.

— *Bureau of the Census. Transportation by water. 1916. Washington, 1920. 230 pp.*

The number of persons employed on both land and sea in connection with water transportation as reported for 1916 was 236,882, which is 48,534, or 25.8 per cent more than were so employed in 1906. Of these, 153,301, or 64.7 per cent, were employed on vessels, being an increase of 12,372, or 8.8 per cent, over the number reported in 1906.

The relative increase in the wages of employees on vessels was much larger than that in the salaries and wages of employees on land, 44.1 per cent for the former compared with 19.6 per cent for the latter. The wages of the men aboard ship constituted 73.3 per cent of the total salaries and wages in 1916 and 69.5 per cent in 1906.

— *Department of Labor. Bureau of Immigration. Immigration laws (act of February 5, 1917). Rules of May 1, 1917 (fourth edition—February, 1920). [Amendment to rule 22.] Washington, 1920. 108 pp. Map.*

UNITED STATES.—*Department of Labor. Children's Bureau. Every child in school. A safeguard against child labor and illiteracy. Washington, 1919. 15 pp. Children's year follow-up series No. 3. Bureau publication No. 64.*

In this account of measures adopted in 44 States during 1918 to inaugurate a back-to-school and stay-in-school movement the need for a better enforcement of the child-labor laws and higher standards for the protection of working children in every State is emphasized. The census of 1910 gives the number of employed children between the ages of 10 and 16 years as approximately 2,000,000. About three-fourths of these are in agricultural pursuits. Less than 300,000 children are affected by the provisions of the Federal child-labor law. Employment on farms and domestic service are exempt from the restrictions of State laws. It has been found that the States which have a high percentage of illiteracy also have a high percentage of rural child labor. Minimum standards for children entering employment formulated at the Children's Bureau conferences in May and June, 1919, are incorporated as a part of the bulletin.

— *Department of the Interior. Bureau of Mines. A glossary of the mining and mineral industry, by Albert H. Fay. Washington, 1920. 754 pp. Bulletin 95.*

This glossary "presents in one comprehensive volume the available standard, technical terms relating to the mining and mineral industry, as well as provincialisms that have been or are now in use in English-speaking countries."

Official—Foreign Countries.

AUSTRALIA (QUEENSLAND).—*Government Statistician's Office. Statistics of the State of Queensland for the year 1917. Brisbane, 1918.*

Included in the data given in Part IV, are duties, fees, and taxes under the Workmen's Compensation Act, the Factories and Shops Act, the Contractors' and Workmen's Lien Act, and the Labor Exchanges Act, and Part VIII, in addition to other information, contains rates of wages, and wholesale and retail prices of articles of general consumption in Brisbane.

— (VICTORIA).—*Government Statist. Forty-first annual report on Friendly Societies, for the year 1918. Melbourne [1919]. xvi, 30 pp.*

Reports a total of 46 societies with 1,496 branches, having 149,558 members, and an annual income of £658,435 (\$3,204,273.93 par) in 1918.

BELGIUM.—*Ministère de l'Industrie, du Travail et du Ravitaillement. Administration des Mines et Inspection du Travail. La situation des industries Belges en décembre 1919. Brussels, 1920. 41 pp.*

Two earlier reports on the industrial situation in Belgium since the war were issued in February and June, 1919, respectively. (See MONTHLY LABOR REVIEW, Novem-

ber, 1919, p. 350.) This last investigation includes all mines under the supervision of the Administration of Mines and the industrial establishments employing 20 or more persons in 1914.

In comparing the number of persons employed in mines and metallurgical establishments in December, 1919, with the number so employed in December, 1913, the following data are given: Total number employed in December, 1913, 230,538; in December, 1919, 201,648. In industrial establishments there were 412,462 persons employed at the first date and 289,172 at the latter date.

In December, 1918, the number of unemployed persons to whom unemployment aid was being furnished exceeded 800,000. By the end of 1919 this number had been reduced to 120,000. On June 29, 1919, unemployment benefits paid for the two preceding weeks amounted to 12,353,015 francs (\$2,384,131.90, par) and for the two-week period ending November 16, 1919, the amount of such benefits was 5,298,122 francs (\$1,022,537.55, par).

CANADA (NOVA SCOTIA).—*Department of Public Works and Mines. Annual report on the mines, 1919. Halifax, 1920. 74 pp.*

States that during the year ending September 30, 1919, there were 20 fatal accidents in coal mines, which was a decrease of 102 when compared with 1918, during which year one explosion caused 88 deaths. The death rate per one thousand men employed in coal mines was 1.86 as compared with 11.77 for the preceding year. The number of men employed in the coal mines for the year ending September 30, 1919, was 12,925.

— (ONTARIO).—*Department of Labor. Mother's allowances; an investigation. Toronto, 1920. 126 pp.*

A summary of the contents of this report is published on pages 170 and 171 of this issue of the MONTHLY LABOR REVIEW.

DENMARK.—*Arbejdsanvisningsdirektøren. Indberetning for Finansaaret 1918-1919. Copenhagen, 1920. 15 pp.*

The report of the director of the Danish employment exchanges for the fiscal year 1918-19 shows the existence of 62 labor exchanges. These exchanges received 92,582 applications for positions, and placed 25,855 persons. The cost of the system was 284,149.80 crowns (\$76,152.15, par), or 10.99 crowns (\$2.95, par) per person placed.

NETHERLANDS.—*Central Bureau voor de Statistiek. Verslag, 1917, 1918. The Hague, 1918, 1919. 2 vols. 38, 44 pp.*

NETHERLANDS.—*Centrale Commissie voor de Statistiek. Jaarverslag, 1917, 1918. The Hague, 1918, 1919. 2 vols. 79, 160 pp.*

The four volumes listed in this and the preceding entry comprise the administrative reports of the Central Statistical Organization of the Netherlands, and its advisory commission for the years 1917 and 1918. All official statistics are centralized in this bureau and its advisory commission.

— (AMSTERDAM).—*Arbeidsbureau. Elfde Jaarverslag, 1918. [Amsterdam, 1919.] 8 pp. (Reprint from Verslag van den Toestand der Gemeente Amsterdam over 1918.)*

At the beginning of 1919 there were 9,426 employees on the pay roll of the department of public works and the various municipal establishments of the city of Amsterdam. Of that number 8,409 had been full-time workers, i. e. had worked 300 days per year during the year 1918. The average weekly wages in all departments and establishments increased from 15.54 florins (\$6.25, par) in 1913 to 28.27 florins (\$11.36, par) during the first half of 1919. The average weekly wage is nearly the same in all departments, judging from the figures shown for 1919.

¹ Fiscal year ending Mar. 31.

SWEDEN.—*Pensionsstyrelsen. Allmänna pensionsförsäkringen år 1918. Stockholm, 1920. 43 pp.*

The Swedish pension law (June 30, 1913), the operations of which for the year 1918 are reported in the document listed above, provides an old-age pension for every citizen upon attainment of the age of 67 years or upon becoming incapacitated for work, and after paying premiums for a specified number of years. The base premium is 3 crowns per year; it is increased by graded amounts in proportion to annual income. All persons 15 to 66 years of age are required to insure and to pay premiums.

The number of individuals applying, in 1918, for pensions for the first time, was 27,924. The total number of requests was 38,942. Of these requests 27,220 were granted and payments made in the sum of 2,075,753 crowns (\$556,301.80, par). Certain supplementary pensions under special clauses of the law were also made to the amount of 30,813 crowns (\$8,257.88, par).

SWITZERLAND.—*Assemblée Fédérale. Message du Conseil fédéral à l'Assemblée fédérale concernant l'attribution à la confédération du droit de légiférer en matière d'assurance-invalidité, vieillesse et survivants, et la création des ressources nécessaires pour les assurances sociales. [Berne.] June 21, 1919. 238 pp.*

Message of the Federal Council to the Federal Assembly concerning the right of the Confederation to legislate in matters concerning invalidity, old-age, and survivors' insurance, and the creation of the necessary resources for social insurance.

Unofficial.

AMERICAN FEDERATION OF LABOR. *New Hampshire State Branch. Proceedings of the eighteenth annual convention, held at Rochester, July 15, 16, and 17, 1919. Rochester, Charles H. Bean, jr., secretary-treasurer, 1919. 54 pp.*

AMERICAN SOCIOLOGICAL SOCIETY. *The problem of democracy. Papers and proceedings, fourteenth annual meeting, held at Chicago, Ill., December 29–31, 1919. Chicago, University of Chicago Press, 1920. 295 pp. Publications. Volume XIV.*

Papers of special interest are on Organized labor and Democracy, by Matthew Woll, and Americanization, by Jane Addams.

AMERICAN WOOD WORKING MACHINERY COMPANY. *American woodworking machinery for vocational training. Rochester, N. Y., 1920. 162 pp. Illustrated.*

ARNOT, R. PAGE. *Trade unionism: A new model.* London, Independent Labor Party, 1919. 16 pp.

Characterizing branch unions and craft unions as especial weaknesses in the system of modern British trade unionism, the author advocates industrial unionism as a means of correcting these weaknesses and making the trade-union an effective force. According to this plan the workshop is made the unit of organization. It includes also the creation of a district committee in each industry based upon the shop as its unit and forming a part of a district labor council representing all industries, and lastly a national industrial union made up of representatives of shop and district unions.

ASSOCIATION VALENTIN HAÛY POUR LE BIEN DES AVEUGLES. *Le retour à la terre du soldat aveugle. Avec une préface de Henri de Régner. Lettres des soldats aveugles offrant des exemples pratiques de réadaptation aux travaux agricoles, dédiés par l'Association Valentin Haüy aux agriculteurs blessés aux yeux qui veulent reprendre leur vie d'autrefois.* Paris, 1919. 55 pp. Illustrated.

A collection of letters written to the Association Valentin Haüy for the Benefit of the Blind, by blind soldiers, giving practical examples of their readaptation to agricultural labor.

BAYLE, F. *Les salaires ouvriers et la richesse nationale.* Paris, Dunod, 1919. 213 pp.

A discussion on modern systems of wage payments, including the Willans, Rowan, Taylor, and the Gantt systems. A chapter (V) is devoted to wages and war-time bonuses.

CANISY, CTE. DE. *La question ouvrière dans le Bassin de Briey.* Paris, Payot et Cie., 1919. 223 pp. Bibliothèque Politique et Economique.

Discusses the labor problem in the Bassin de Briey, which region, in 1913, supplied 70 per cent of the total iron output of France. The author believes the development of this region depends in great part upon the manner in which the labor question is settled.

CLEVELAND CHAMBER OF COMMERCE. *Committee on labor relations. Labor relations in Cleveland. A declaration of principles establishing a proper basis therefor.* [Cleveland] 1920. 5 pp.

States that public opinion is the most powerful force to bring about desired industrial conditions. The committee declares that employees should not intentionally restrict individual output in order to create an artificial scarcity of labor as a means of increasing wages or continuity of employment, and that employers should not restrict production to create an artificial scarcity of product in order to increase prices. The report considers production, wages, hours of work, working conditions, collective bargaining, open or closed shop, information and frankness, coercive measures, and settlement of labor disputes. The committee states that "the employees' right to strike and the employer's right to lock out his employees are both secondary to the public's right to service."

CONFERENCE OF STATE AND PROVINCIAL HEALTH AUTHORITIES OF NORTH AMERICA. *Proceedings of the thirty-fourth annual meeting, held at Atlantic City, N. J., June 6-7, 1919.* Concord, N. H., The Rumford Press, 1919. 142 pp.

Among the articles of interest to labor are recent developments in the United States in favor of health insurance, by John B. Andrews; Recent developments in the United States in opposition to health insurance as a national policy, by Dr. George E. Tucker, and Health insurance as a means of organized practice of medicine, by John A. Lapp.

DAVIS, PHILIP, ED. *Immigration and Americanization. Selected readings.* Boston, Ginn & Co., [1920.] 770 pp.

A handbook of addresses and articles on all possible phases of the subjects of immigration and Americanization, designed to meet the general public need of a summarization of the best literature upon these topics. The selections are arranged in two parts: Book I, Immigration; Book II, Americanization, and present both a

chronological and a logical development of the subject matter. As the value of this collection has been tested in courses for teachers of immigrants at Boston University, it is believed that it will prove useful in similar courses elsewhere.

DODD, EDWARD L. *Some dangers in establishing a pension system and the proper precautions.* Austin, Texas, January 20, 1919. 26 pp. *University of Texas Bulletin* No. 1905.

This paper undertakes to point out a few of the large features of pensions, in accordance with the author's belief that "it is possible to establish a pension system which will be equitable to all employees, present and future, and will be a great blessing to them," and in conclusion states certain propositions which he considers essential to a clear understanding of such a system.

DOUGLAS, PAUL H. *Absenteeism in labor.* New York, *Academy of Political Science*, 1919. Pp. vii 678. Reprinted from *Political Science Quarterly*, Vol. XXXIV, No. 4, December, 1919.

Considers the amount, losses, and causes of absenteeism, and suggests methods of reducing it. The losses are classified as (a) machinery or equipment rendered less efficient by the absence of the worker, (b) extra administrative and clerical force required, (c) lessened productivity of the absentee's associates, and (d) loss of profit upon the labor of the workman himself. The most important causes are given as sickness and ill health, accidents, long hours, women in industry, nature of the employment, prevalence of other work, payment of overtime bonus, lack of materials, climatic conditions, housing conditions, inadequate transportation facilities, liquor, wage income higher than standard of living, and separation of interests between workman and employer. In order to reduce the amount of absenteeism, the author suggests the establishment of efficient employment departments, the investigation of absences, the imposition of fines for tardiness and absence, and payment of bonuses for attendance, the improvement of working and social conditions, the cultivation of the cooperative spirit between employer and workmen, prohibition, competitive devices to stimulate interest, and a shorter working-day with the omission of the overtime bonus.

GARTON FOUNDATION. *The industrial council for the building industry. The story of a revolution in industrial development, together with the full text of the Foster report on organized public service in the building industry.* London, Harrison and Sons. 153 pp.

HILDEBRAND, KARL, COMP. *De Svenska Statsmakterna och Krigstidens Folkhushållning August, 1914-1918. Stockholm, 1916-1919. 4 vols.*

This is a compilation, under official authority, of Swedish experience during the war in the general field of industrial control, but emphasizing particularly the work of the Government regulating the food supply. The headings of the principal chapters indicate the scope of the work: (1) State loans and financing; (2) Money and banking; (3) Production and distribution of necessities; (4) Railroads and communication; (5) Tariffs, etc. There is an abundance of material on prices and unemployment.

HOBSON, S. G. *National guilds and the State.* London, G. Bell & Sons, Ltd., 1920. xix, 406 pp.

HODGKIN, MARGARET. *Factory work for girls.* New York, The Woman's Press, 1920. 84 pp.

INDUSTRIAL COUNCIL FOR THE BUILDING INDUSTRY. *Building Trades Parliament. Annual meeting, in London, August, 1919. Minutes of proceedings [and Appendices B1 and B2].* [London, 1919.] 51, 8 pp.

This report of proceedings includes as appendices (a) The interim report of the building resettlement committee on the supply of building labor for the Government housing schemes; (b) Organized public service in the building industry; (c) First report of the safety and welfare committee. The supplementary pamphlet includes appendices omitted from the original report.

INDUSTRIAL COUNCIL FOR THE BUILDING INDUSTRY—*Quarterly meeting, November, 1919. [London, 1919.] 12 pp.*

A brief summary of the report on apprenticeship will be found on pages 119 to 122 of this issue of the REVIEW.

INTERNATIONALES SEKRETARIAT DES PERSONALS IN ÖFFENTLICHEN DIENSTEN UND BETRIEBEN. *Protokoll des Internationalen Kongresses des Personals in öffentlichen Diensten und Betrieben abgehalten in Amsterdam am 20., 21., und 22. Oktober, 1919. Berlin, 1920. 32 pp.*

A digest of the proceedings of the international congress of workers and employees in public services held at Amsterdam Oct. 20 to 22, 1919. The congress was attended by delegates of organizations from Belgium, Denmark, Germany, England, France, the Netherlands, Norway, and Sweden, representing 456,000 members. A large part of the discussions was taken up by controversies between the French and Belgian delegates on the one side and the German delegates on the other over the attitude of the international secretariat, which during the war was located in Berlin, toward the deportation of French and Belgian workers. These controversies were finally settled by a declaration of the German delegation satisfactory to the French and Belgian delegates. The former international secretary was given a vote of confidence, but still the congress resolved to move the secretariat to Amsterdam and elected N. Van Hinte (Holland) secretary. The congress elected a commission charged with the drafting of new by-laws and of a program of activities. The annual contributions per member and per year were fixed at 5 pfennings (1.2 cents, par) for Germany, 3 cents (1.2 cents, par) for Holland, 6 centimes (1.2 cents, par) for France and Belgium, and at equivalent amounts for all other countries. A resolution was adopted advocating the creation of a central organization for municipal workers in those countries in which such a central organization does not yet exist. It was also resolved to draft the new by-laws in such a manner that class conscious organizations of salaried public employees would be permitted and encouraged to affiliate with the international union.

KANEGAFUCHI SPINNING COMPANY (LTD.) (JAPAN). *Its constitution; how it cares for its employees and workers. Tokio, October, 1919. 108 pp. Tables.*

LABRY, RAOUL. *Une Législation Communiste. Recueil des lois, décrets, arrêtés principaux du gouvernement bolchéviste. Paris, Payot et Cie., 1920. XVIII, 590 pp.*

This is a collection of legislative measures enacted by the soviet government of Russia, including a few decrees issued by the Union of the Communes of the Northern district and of Moscow. There is a section devoted to Labor laws, Labor inspection service, Wages, and Social insurance.

LEGAL AID SOCIETY (NEW YORK CITY). *Forty-fourth annual report for the year 1919. New York, 1920. 78 pp.*

LEMAIRE, FERN. *Questions de régimes de salaires et d'organisation industrielle. Modes de rémunération. Salaires à primes. Taylorisme. Second edition. Liège, Imprimerie Henri Mambourg, [1920?] 124 pp.*

This volume discusses the various methods of wage payment and their effect on output and cost of production, the four chapters being devoted respectively to (1) maximum production; (2) traditional methods of wage payments; (3) premiums; and (4) the Taylor system.

MAXEINER, STANLEY R. *War contributions to industrial surgery. In Modern Medicine, Vol. II, No. 3. Chicago, Modern Hospital Publishing Company, March, 1920. Pp. 231-235.*

Advocates among other measures in industrial surgery more attention and better care of the slightly injured, the use of antitetanic serum in all industrial accident cases with abrasions of the skin, and the establishment of schools for the reeducation of the industrial cripple. This paper was read before the Hennepin County Medical Society, Minneapolis, January 14, 1920.

MERRICK, DWIGHT V. *Time studies as a basis for rate setting.* New York, The Engineering Magazine Co., 1919. 366 pp.

MUKHERJI, P. *The Cooperative Movement in India. Second edition.* Thacker, Spink & Co., Calcutta and Simla, 1917. 453 pp. *Indian Citizen series.*

Since March 25, 1904, the date on which the Cooperative Credit Societies Bill was passed, the growth of the cooperative movement in India has been rapid. In 1915 there were 17,327 cooperative societies, having 824,469 members, and capital to the amount of Rs. 8,96,61,722 (\$29,088,952, par). Since India is primarily agricultural, it is not surprising that of the above number 15,861, or about 92 per cent, are agricultural credit associations. The author points out that even this number is inadequate since there are in India 220,000,000 agriculturists to be financed. It is stated that by the aid of these associations "laborers have become owners; hopeless debt has been banished, and the money lender driven out; agriculture and industry have been developed, and the villagers in the poorest tracts have become prosperous; the illiterate man has turned toward education and the drunkard has been reclaimed; the middleman has been eliminated, the raiyat is getting full value for his produce and paying his rent with ease; village life has been stimulated by associated action and by the business education of the bank; punctuality, thrift, and mutual confidence are being taught; litigation has decreased, and morality has improved; activity has taken the place of stagnation and routine; associated action has replaced mutual distrust."

The book contains a discussion of the various types of societies, such as the cooperative stores, farmers' marketing and supply societies, housing associations, etc.

The greatest obstacle to the growth of cooperation, the author states, is the illiteracy of the people.

NATIONAL INDUSTRIAL CONFERENCE BOARD. *Changes in the cost of living, July, 1914–November, 1919.* Boston, December, 1919. 24 pp. *Research report No. 25.*

This report is reviewed on pages 88 and 89 of this issue of the MONTHLY LABOR REVIEW.

— *Conciliation and arbitration in New Zealand.* Boston, December, 1919. 46 pp. *Research report No. 23.*

A brief review of this report appears on pages 216 to 218 of this issue of the MONTHLY LABOR REVIEW.

— *A works council manual.* Boston, February, 1920. 32 pp. *Research report No. 26. Supplemental to Research report No. 21.*

This manual supplementing Research report No. 21, which was reviewed in the MONTHLY LABOR REVIEW for January, 1920, pp. 191, 192, is designed for the use of employers who wish to introduce works councils in their establishments. It outlines the procedure to be followed in instituting the different types of shop committee plans, and the appendixes give model drafts of constitutions for large and small establishments and several charts showing methods of procedure of the committees.

NATIONAL TUBERCULOSIS ASSOCIATION. *Transactions of the fifteenth annual meeting, Atlantic City, N. J., June 14, 16, and 17, 1919.* New York, 381 Fourth Avenue. [1920.] 606 pp.

NICHOLSON, J. SHIELD. *Inflation.* London, P. S. King & Son (Ltd.), 1919. 143 pp.

This book treats of the inflation of the currency as a result of the excess of public expenditure over the revenue of the country and the abandonment of the gold standard. The effect of this inflation upon wages and upon industrial unrest is discussed, and the author argues that the working classes will gain far more by a general fall in prices than by a continued rise in wages.

PARKER, CARLETON H. *The casual laborer and other essays.* N. Y., Harcourt, 1920. 199 pp.

Of this series of four articles, three, entitled "The casual laborer," "The I. W. W.," and "Motives in economic life," have previously appeared as magazine articles. The first essay, "Toward understanding labor unrest," written by Mr. Parker shortly

before his death, is published for the first time. The purpose of this essay is to show that the causes of labor unrest are largely psychological, that labor unrest is the result of the repression of normal instincts and is fundamentally the same as discontent appearing in other fields of activity. The social environment of the casual worker, it is claimed, is such that he seeks compensation for social inferiority in strikes and sabotage, the reaction being defined as an ordinary mental disease of a functional kind. The remedy suggested is to adopt a new standard of normality, the first step in this direction being to break down inhibitions to free experimental thinking.

Mr. Parker's report of the wheat and hop fields riot of 1913, made to Hiram W. Johnson, then Governor of California, is published as an appendix to the volume.

ROBERTS, RICHARD. *The unfinished program of democracy.* London, The Swarthmore Press (Ltd.). [1919.] 326 pp.

ROBERTSON, JAMES. *Labor unionism based upon the American shop-steward system.* Portland, Oreg. [1920.] 16 pp. Chart.

An explanation of the shop-steward movement in terms of industrial unionism.

SAFETY INSTITUTE OF AMERICA. *Safety fundamentals. Lectures given on alternate Saturday mornings from Feb. 1 to June 7, 1919, for the benefit of factory inspectors employed by the city of New York, the States of New York and New Jersey, and insurance companies operating in and near New York City.* New York, 1920. 228 pp.

The subjects of these lectures are The body which gets hurt, The injured body and its treatment, Protective clothing for men, Suitable work garments for women in industry, Safe heads and good eyes, Guarding machinery, Arrangement of machinery and working places, Heating and ventilation, Illumination, Nature's forces for and against workmen, and Safety education and shop organization.

SAMVIRKENDE FAGFORBUND. *Beretning om de Virksomhed, 1. April 1918—31. Marts 1919.* Copenhagen, 1919. 195 pp.

Annual report of the Danish Federation of Labor for the fiscal year ending March 31, 1919. The statement of the report concerning hours of labor is given on pages 108 and 109 of this issue of the MONTHLY LABOR REVIEW.

SCHIFF, MORTIMER L. *Profit-sharing.* New York, 1919. 24 pp. Reprinted from the *New York Times*, October 5, 1919.

SECRIST, HORACE. *Statistics in business, their analysis, charting, and use.* New York, McGraw-Hill Book Company, Inc., 1920. 137 pp.

The essential kinds of information for business executives and the best methods of securing, classifying, tabulating, and summarizing facts are treated in this book. A classification of the outstanding and basic facts of business includes information of various kinds about labor, capital, production, population, markets, land and building, transportation, and laws and policies. A section of bibliographical comments includes a number of Government publications such as the MONTHLY LABOR REVIEW, Monthly Summary of Commerce and Finance, and reports of several of the departments as among the most valuable sources of information on the particular subjects with which each deals.

STASSEN, DR. M. *La fatigue de l'appareil visuel chez les ouvriers mineurs.* Liège, 1914-1919. 233 pp.

This is a scientific study of the effect of underground work upon the organs of vision, with especial reference to coal mines.

STONE, GILBERT. *The British coal industry.* London and Toronto, J. M. Dent & Sons, (Ltd.), 1919. 188 pp.

The author's aim is to stimulate production as the chief remedy for the present deplorable condition of the coal industry in Great Britain. He gives an historical sketch, to date, of working conditions and legislation relating to the industry, together with "well-ascertained facts" as to the advantages or disadvantages of various theories

of management including statements of results obtained by other countries from trials of State control, etc.

Other chapters relate to output, export trade, the home consumer, and the final one to wages and disputes, quoting the laconic phrase of the Prime Minister, "With production we get prosperity; without it we starve."

STUDENSKY, PAUL. *Teachers' pension systems in the United States. A critical and descriptive study.* New York: D. Appleton & Co., 1920. 460 pp. *The Institute for Government Research. Studies in administration.*

This comprehensive study of the subject of teachers' pensions is divided generally into two parts: A discussion of the problem of teachers' pensions and an account of typical teachers' pension systems of to-day. Five appendixes deal with (1) comparative analysis of teachers' pension systems; (2) reference to laws, statistical reports etc., relative to all teachers' pension systems in the United States, by States; (3) laws providing for sound teachers' pension systems; (4) actuarial tables; (5) bibliography.

UNION SUISSE DU COMMERCE ET DE L'INDUSTRIE. *Rapport sur le Commerce et l'Industrie de la Suisse, 1918.* Zurich [1919]. 524 pp.

The annual report for the year 1918 of the Secretariat of the Swiss Industrial and Commercial Union on business conditions in the various branches of industry and commerce. In addition the volume contains general statistical data on the economic situation in Switzerland. A digest of economic measures taken by the Swiss Federal authorities and of similar measures taken by foreign governments during the period October 1, 1918, to June 30, 1919, is given in an appendix.

UNITED MINE WORKERS OF AMERICA. *The case of the bituminous coal mine workers as presented by the United Mine Workers of America to the President's coal commission appointed December, 1919.* Washington, 1920. 78 pp. Chart.

The report of the President's coal commission was summarized in the April issue of the REVIEW (pp. 40-50).

— *Proceedings of the twenty-seventh consecutive and fourth biennial convention.* Cleveland, Ohio, September 9, 1919. In three volumes. Indianapolis, Bookwalter-Ball Printing Co., 1919. 480, 996, 544 pp.

UNITED STATES STEEL AND CARNEGIE PENSION FUND. *Treasurer's and manager's ninth annual report for year ending December 31, 1919.* [Pittsburgh, 1920.] 8 pp.

VALDOUR, JACQUES. *La vie ouvrière. Observations vécues.* Paris, Arthur Rousseau, 1919. 390 pp.

A study of working conditions among miners in the northern and central portions of France.

VERBAND DER GEMEINDE- UND STAATSARBEITER. *Protokoll über die Verhandlungen des achten Verbandstages abgehalten vom 1. bis 6. September 1919 in Nürnberg.* Berlin, 1919. 183 pp.

The minutes of the eighth general meeting of the German Federation of Workers in State and municipal services held at Nuremberg September 1 to 6, 1919. The meeting adopted several important resolutions. It went on record as advocating the universal conclusion of collective agreements as a suitable means of doing away with the one-sided dictatorial fixing of wage and working conditions by the employer and his organs. It demanded decisive participation of the workers' representatives in legislation, State and municipal administration, and in the management of industrial establishments, the immediate socialization of all capitalistic enterprises, but particularly of mines, enterprises for the generation of power, iron and steel works, banks, and insurance companies. It condemned the works council bill as a piece of patchwork which does not give the works councils sufficient influence in the administration of State and municipal establishment nor remove the existing bureaucracy. The meeting adopted new by-laws for the federation and regulated anew the contributions of members as well as the strike, unemployment, and death benefits.

VERBAND DER GEMEINDE- UND STAATSARBEITER. *Reichssektion Gesundheitswesen. Neuzzeitliche Dienst- und Ausbildungsgestaltung des Pflegepersonals, by Dr. Jakobit, and Die Berufsausbildung des Krankenpflegepersonals, by Emil Dittmer. Berlin, 1920. 32 pp.*

Two papers read at the third conference of the section on hygiene of the German Federation of Workers in State and municipal services. Both papers deal with the working conditions and the occupational training of nurses.

— *Die Sozialisierungsbestrebungen im Staat und Gemeinde, by Emil Dittmer, and Das Betriebsrätegesetz, by Josef Weigl. Berlin, 1919. 31 pp.*

Two papers read at the eighth general meeting of the German Federation of Workers in State and municipal services. The first of these papers deals with proposals of socialization in the State and municipalities and the second with the works council law.

— *Die Tarifverträge in gemeinnützigen Betrieben. Berlin, 1919. 508 pp.*

A compilation of collective agreements concluded during the first half of 1919 by organizations of workers in German State and municipal services with communes, unions of communes, district, provincial and State authorities, monopolies, and employers' associations. The agreements included in the compilation cover 1,300 establishments employing about 110,000 workers.

VEREIN DER WOLLINDUSTRIELLEN MÄHRENS. *Bericht des Vereins erstattet in der 37 ordentlichen Hauptversammlung vom 12. Februar 1920. Brünn, 1920. 79 pp.*

The annual report for the year 1919 of the Association of Woolen Goods Manufacturers of Moravia. The association received reports from 49 establishments which before the outbreak of the war employed 17,189 workers, of which 7,841 were males and 9,348 females. On December 15, 1919, 48 of these establishments were operating while one had closed down temporarily. The total number of workers employed in the 48 establishments had decreased to 10,626. Of these 30 were working 3 days per week, 759 worked 4 days per week, 1,473 worked 5 days, and 8,364 worked 6 days per week. On December 22, 1919, the association concluded a collective agreement with the workers' organizations which is to remain in force up to June 30, 1920. The agreement provides for basic wages for all occupations and for premiums for pieceworkers. In addition the workers receive (1) a fixed cost of living bonus of 25 hellers (5.1 cents, par) per hour, (2) a bonus based on their weekly net earnings and amounting to between 100 and 140 per cent of these earnings, and (3) a family subsidy of 4 crowns (81.2 cents, par) per child and week, but not to exceed 20 crowns (\$4.06, par) per family. Time and a half is to be paid for overtime and holiday work and double time for Sunday work. The industry suffered greatly from lack of raw material and coal.

WORKERS' EDUCATION. *A symposium. Reprinted from the Shipbuilders' News and Navy Yard Employee, Brooklyn, N. Y., for September, 1919, by the Industrial committee of the department of research of the Young Women's Christian Association. New York, 1919. 13 pp.*

CONTENTS.—The Boston Trade Union College, by W. H. L. Dana; The new school for social research, by Charles A. Beard; The united labor education committee, by J. M. Budish; The workers' university, by Juliet Stuart Poyntz; Labor and education, by Frank Tannenbaum; Workers' education and the Young Women's Christian Association, by Mary L. Cady.

MONTHLY LABOR REVIEW

VOL. X—NO. 6

WASHINGTON

JUNE, 1920

Minimum Quantity Budget Necessary to Maintain a Worker's Family of Five in Health and Decency.

THE Bureau of Labor Statistics prepared primarily for the use of the Congressional Commission on Reclassification a tentative quantity and cost budget necessary to maintain a family of five in health and decency in Washington, D.C.¹ It is even more important to establish a quantity budget for the workingman's family than for the clerical family. Such a quantity budget is needed for the more accurate determination of the cost of maintaining a workingman's family in health and decency, and also for the more accurate calculation of changes in the cost of living. This tentative quantity budget for a worker's family constitutes the bureau's best estimate at this time of what should be included in the family budget of the workingman. The bureau was assisted in compiling this budget by the Committee to Study the Relationship of Standards of Living to Health, of the National Conference on Social Work, and especially by Miss Caroline L. Hunt, Office of Home Economics, United States Department of Agriculture.

Food.

IN THE determination of a proper family dietary there are two standards which must be assumed at the beginning: (1) A standard food requirement in calories per man per day; (2) a standard table giving the food-consuming capacity of women and children in terms of a common unit—the equivalent adult male.

It has been estimated that the number of calories needed by a man at moderately hard muscular work is 3,000 to 3,200 per day. About 10 per cent of the calorie value of food is wasted in preparation, cooking, etc., and also a small per cent of the food which enters the mouth is not digested or assimilated. Therefore, 3,500 calories purchased represents approximately 3,000 to 3,200 calories actually consumed. Experience indicates that it is necessary to purchase this amount of food per man per day in order to insure sufficient variety and quantity, both as to bulk and calorie content. If the housewife is a dietetic genius, 3,500 calories per man per day purchased in the market may be a liberal allowance.

The relative proportions of the food consumed by the husband, wife, and children have been determined approximately by laboratory experiments and by estimates taking into account the factors of age, sex, weight, occupation, and activity. A scale showing relative amounts of food consumed by men and women at different kinds of

¹ This budget was presented by Commissioner Royal Meeker as a progress report of the Committee to study the relationship of Standards of Living to Health at the annual meeting of the National Conference of Social Work, April 21, 1920. It was also the basis of that portion of his address dealing with cost of living which he delivered before the Group Living Conference at Lake Placid, N. Y., May 29, 1920.

work, such as hard muscular work, moderately active muscular work, light muscular work, and sedentary occupations, and by children of different sexes and ages, is available and could have been used in this instance but for the increased amount of labor which it would have entailed. In studies of such large scope as a country-wide cost-of-living survey, brevity is essential and the following abridged table of equivalent adult males has been found more practical and sufficiently accurate for general purposes and it has, therefore, been adopted for use by the Bureau of Labor Statistics:

Male, 15 years or over.....	1.00
Female, 15 years or over.....	.90
Children, 11 to 14 years, inclusive.....	.90
Children, 7 to 10 years, inclusive.....	.75
Children, 4 to 6 years, inclusive.....	.40
Children, under 4 years.....	.15

The following food budget has been drawn up for a family of five, including husband, wife, and three children—boy, aged 12; girl, 6; and boy, 2. According to the above standard the calorie requirement of a man is taken as 1; that of a woman is 0.9; a boy of 12 years, 0.9; a girl of 6 years, 0.4; and a boy of 2 years, 0.15. The combined food requirements of this family would be equal to that of 3.35 adult males.

The quantity food budget submitted here as representing the food requirements of the standard family of five was obtained by averaging the actual amounts of foods used by 280 families selected from the cost-of-living survey made by the Bureau of Labor Statistics. The families were selected for special food analysis because they averaged in size approximately 3.35 equivalent adult males, and in the neighborhood of 3,500 calories of food purchased per man per day. The food budgets in the Bureau's study were taken in great detail, giving, among other things, the amount of each article of food purchased for a year for each family scheduled. The 280 budgets used in this detailed calorie analysis represented about 25 cases from each of 11 representative cities.

The average food budget obtained from these 280 families was then carefully considered from the standpoint of health. For the most part this average budget contains proteins, fats, and carbohydrates in sufficient quantities and in the right proportions. To make the average food budget acceptable to trained dietitians as a standard food budget, intended to maintain the standard family in health, it was necessary only to reduce slightly the quantity of meat and to increase slightly the quantities of whole milk, fresh vegetables, and fruits.

Quantity of Food for a Family of Five.

The proposed standard food budget submitted herewith, therefore, includes the kinds and, in a large degree, the quantities of food actually consumed by actual workingmen's families. The proposed standard budget has not been worked out by theoretical "experts" in the secrecy of the laboratory. It is made up of things which real people eat day by day throughout the year. It must not be hastily inferred that no improvement can be suggested in the workingman's diet because these workingmen's families ate sufficient food of about the proper kind. Only those families were included

in the special food analysis whose diets measured up to the calorie requirements of sound dietetics. Had the food budgets of all families been averaged together, the showing would have been quite different.

Following is the budget showing yearly quantities in pounds:

ANNUAL QUANTITY OF FOOD FOR A FAMILY OF FIVE, INCLUDING HUSBAND, WIFE, AND THREE CHILDREN (BOY AGED 12, GIRL 8, AND BOY 2).

Bureau of Labor Statistics and Department of Agriculture Budgets Compared.

The Department of Agriculture has prepared a quantitative estimate of weekly food supply for an average family, consisting of husband, wife, and three children under 14, whose ages total not less than 20 nor more than 24 years. The family on which the estimate is based is slightly larger in equivalent adult males than the family used in the food budget of the Bureau of Labor Statistics, and thus the amounts of food are somewhat higher than those required for the standard family. Nutrition experts of the Department of Agriculture recognize that the amount of fresh fruits and vegetables in its budget is possibly higher than absolutely necessary for health. For this reason a considerable difference in the two budgets exists in this food group. In all other classes of food the two budgets do not vary materially.

The following is a comparison of the Bureau of Labor Statistics food budget with the dietary standards established by the Department of Agriculture:

COMPARISON OF BUREAU OF LABOR STATISTICS AND DEPARTMENT OF AGRICULTURE BUDGETS SHOWING WEEKLY QUANTITIES OF FOOD EXPRESSED IN POUNDS OF FRESH AND EQUIVALENT WEIGHTS.

Article.	Bureau of Labor Statistics.	Department of Agriculture.
	<i>Pounds.</i>	<i>Pounds.</i>
Vegetables:		
Fresh, starchy.....	15.1	(1)
leafy.....	3.4	(1)
other.....	8.3	(1)
Canned.....	1.2	(1)
Dried (fresh weight ²).....	5.1	(1)
Fruits:		
Fresh.....	10.9	(1)
Canned.....	.9	(1)
Dried (fresh weight ²).....	4.0	(1)
Total, vegetables and fruits.....	48.9	70.0
Milk (14 quarts).....	30.8	30.8
Meats (except bacon and salt pork), fish, poultry, cheese, eggs, etc.....	11.8	10.5
Cereals and their products (flour, meal, rice, breakfast foods, macaroni, bread, ³ crackers, etc.).....	19.0	16.0
Sweets (sugar, molasses, ⁴ sirup, ⁴ etc.).....	3.9	4.5
Fats (butter, oil, lard, bacon, ⁵ salt pork, ⁵ cream, ⁵ etc.).....	3.7	4.0
Total (exclusive of tea, coffee, and condiments).....	118.1	135.8

¹ Vegetables and fruits are not subdivided in the Department of Agriculture's budget.

² 6 times dried weight equals fresh weight.

³ 1 pound of bread equals three-fourths pound of flour.

⁴ 1 pound of molasses, sirup, or candy equals three-fourths pound of sugar.

⁵ 1 pound of bacon or salt pork equals three-fourths pound of butter, and 1 pound of cream equals one-fourth pound of butter.

The Department of Agriculture employs fresh and equivalent weights in its estimate. One pound of dried fruit or vegetables is counted as six pounds of fresh, and the weight of cereals, sweets, and fats is converted to equivalent pounds of flour, sugar, and butter, respectively. For the purpose of comparison the Bureau of Labor Statistics budget has been computed by approximately the same method.

Variety of Foods Available in Different Seasons.

The food budget, however, in either of the forms in which it has been presented, does not offer to the social worker, or to the housewife, a practical guide in the purchasing of a health-producing diet-

ary. In order to assist in buying, or to serve as a check against quantities ordinarily purchased, the weekly quantities of the actual articles of food embraced in the budget have been segregated into (1) year-round foods, (2) special summer foods, and (3) those which will probably be used during the winter season when the price of fresh fruits and vegetables prohibits their purchase.

The budget as a whole consists of 5,961 pounds of food (dry weight) per year, or approximately 115 pounds per week for the family. About 100 pounds per week are articles of food of a more or less staple character which may be purchased at any season of the year. These foods have been placed in the year-round group, leaving 15 pounds of food per week to be made up from the seasonal groups. The foods which are abundant only in the summer season make up a weekly average of 7.6 pounds; those which are available in the winter season, 6.1 pounds. These averages, however, are on the basis of 52 weeks, and to ascertain the quantity per week of the season (approximately 26 weeks) in which they are to be used, it will be necessary practically to double the listed quantities of winter and summer-season foods. Following is the list of year-round, winter-season and summer-season foods, showing the average weekly quantity of each allowed in the budget.

AVERAGE WEEKLY QUANTITIES OF YEAR-ROUND, WINTER-SEASON, AND SUMMER-SEASON FOODS CONTAINED IN BUDGET.

⁴ Quantities to be doubled during the summer season, May to October, inclusive.

In listing these foods and the average weekly quantities, it is not the intention to recommend that the housewife who buys food for a family of five should attempt to secure either these exact foods or the specified quantities. The articles and quantities will necessarily have to be treated with a large degree of elasticity. In the year-round foods, it will of course be advisable to vary the amounts according to the season, using more fats and carbohydrates during the winter and less during the summer when heat-producing foods are not so much required. Especially will this be true of fat meats, corn meal, macaroni, rice, beans, etc. On the other hand, eggs, apples, cabbage, spinach, kale, etc., although available throughout the year, will probably be used in greater quantities in summer than in winter.

On account of variations in the length of seasons in different sections of the country, as well as the overlapping of foods from one season to the other, a general grouping of seasonal foods is extremely difficult. Grapefruit, for instance, while primarily a winter fruit, may be secured in some of the months usually classed in the summer season. Many families also make it a practice to use navy and dried lima beans and canned fruits and vegetables in the summer as well as in the winter season.

The list will prove valuable only as a guide in suggesting the variety of foods available during the different seasons of the year and indicating something of the relative proportions in which they may be purchased in order to furnish a family of five with a dietary which will promote health.

Clothing.

THE level of health and decency in clothing has been interpreted as a level which not only takes into account the physical needs of warmth, cleanliness, and comfort, but also has such regard for appearance and style as will permit the family members to appear in public, and within their necessarily rather narrow social circle, with neatness and self-respect. In other words, the clothing standards of the family are intended to provide a fair degree of that mental satisfaction which follows being reasonably well dressed. But, while admitting the desirability of a more generous wardrobe, an effort has been made to allow only those quantities of clothing consistent with the *minimum* requirement for health and decency, and, where a doubt has existed, to err on the side of conservatism.

The clothing budget herewith presented has as its basis the clothing budgets of approximately 850 families having 3 children under 15 years of age, which were included in the survey of the Bureau of Labor Statistics in 1918-19. This basic material was first modified as the result of a large number of interviews with families in Washington, D. C. The material was then published in tentative form (*MONTHLY LABOR REVIEW*, December, 1919, pp. 22-29), as applying to the family of a clerical worker in Washington. Criticisms and suggestions from clothing experts all over the country have been received and that budget has been made over into the manual worker's family clothing budget here submitted. The clothing budget, like the food budget, is made up of the articles actually worn by real workers and their families. The modifications made in the average clothing budget of the families studied in order to arrive at a standard clothing budget are much more extensive than in the case of the food budget. The articles of clothing are the same in both the actual average budget and the proposed standard budget, but the quality of material and the yearly replacement in the latter have been determined very largely by special study.

The quantities listed in the clothing budget are the *annual replacements*, not the number of garments possessed at any one time. For example, in the husband's clothing budget the annual replacement of a summer suit is given as one-third, which means that one summer suit is expected to last three years. Allowance is made for the purchase of two winter union suits each year, but this does not mean that the worker possesses only two sets of winter underwear. He may have six sets or any other number, but with reasonable care he can manage comfortably by purchasing two suits a year.

In preparing this quantity budget, a considerable amount of sewing at home has been assumed as possible, and has been indicated accordingly. When more than the specified amount is done, a saving may be effected, or the family clothed more abundantly. On the other hand, where little or no home sewing can be done, the number of garments allowed will be barely sufficient to maintain decency. The investigations of the Bureau of Labor Statistics show that during the war clothing purchases of the average worker's family were considerably curtailed. When it is necessary to economize the expense for clothes may be greatly reduced for a season or two, but the effect of renewing the clothing budget after it has become depleted creates a serious situation in family expenditures.

In order to make the yearly clothing budgets more serviceable as a guide in buying, the annual replacements for each member of the family have been divided into year-round, summer, and winter clothing.

In basing the quantities of clothing on what has been considered reasonable length of wear, it has been necessary to assume that clothing purchased in conformity with this budget will be of good average quality.

Clothing Budget of a Family of Five.

⁴ Lump sum of money equal to about 8.5 per cent of total cost of 6-year-old girl's clothing.

⁵ Lump sum of money equal to about 6 per cent of total cost of 2-year-old boy's clothing.

Individual tastes and variations in climate will of course make many changes and adjustments necessary for each family. Occupational requirements will also enter in, especially in the clothing budget of the husband. These variations could not be taken into consideration in preparing a general budget for a standard workingman's family.

It is highly important to consider the clothing budget of each individual member of the family. In the husband's clothing, for instance, allowance has been made for the purchase of only two pairs of work trousers or overalls each year. This appears small until considered in conjunction with the allowances for suits. A summer suit and a winter suit, each to last three years, have been allowed. In other words, the purchase of two suits in three years has been provided, which means that every 18 months on the average the workingman will be able to supplement his work clothes with one suit of discarded "dress up" clothes. Assuming that the workingman's "Sunday" clothes are not subjected to very hard use, these suits when ready for every-day wear may reasonably be expected to form the major part of his work clothing, and not more than two additional pairs of work trousers will be required each year. Since suit coats usually outwear

the trousers, no separate coats to wear with the work trousers have been deemed necessary.

No quantitative allowances have been made for raincoats, slippers, bathrobes, purse, repairs to watch, or any other item of clothing expense which occurs only occasionally. However, a lump sum of money equivalent to something like 7 per cent of the total cost of the husband's clothing has been allowed to cover purchases of this character.

In the wife's clothing, the two new house dresses to be purchased each year may prove inadequate, unless the old summer dresses of previous seasons are worn as everyday house dresses also.

Few women, especially where the climate permits of uniform underwear throughout the year, will wear all the varieties of underwear listed, i. e., winter union suits, summer union suits, combinations, corset covers, brassieres, petticoats, etc. However, the quantities listed under each are small, and where fewer kinds of articles are worn a larger quantity of each will be required.

This is distinctly a health and decency budget, with little provision for "style" or fashionable dress. No allowance has been made for an afternoon dress of silk, a silk petticoat, or silk stockings. Although these articles are doubtless desirable, a wool dress, a suit skirt with a dress waist, a Venetian cloth or sateen petticoat, and lisle or cotton stockings will supply all that is absolutely essential for health and decency.

To care for the multitudinous purchases of "extras," such as dress shields, veils, hair nets, hairpins, combs, slippers, hand bag, dress trimmings, thread, buttons, etc., a lump sum of money of about 8.5 per cent of the total cost of the wife's clothing has been suggested.

The clothing needs of growing children are almost beyond the ability of the budget maker to ascertain or estimate. A reasonably generous clothing allowance has been made for the children, but it is expected that some clothing will be handed down and made over for the younger children, in order to get along on the amounts specified.

In practically all the families visited in the Bureau of Labor Statistics' investigations there seems to be a general agreement that the expense for shoes and stockings for children is one of the serious drains on the family's finances. For the boy of 12, the budget allows for the purchase every year of three pairs of high shoes and two of low, with one repairing of half soles and heels for each of the five pairs. For the girl of 6 years, three pairs of high and two of low are allowed; for the boy of 2 years, two pairs of high shoes and two of sandals. In the case of the two younger children, shoe repairing is not considered feasible and provision has not been made for it.

Housing.

A HOUSING standard based upon health requirements must consider primarily air space, ventilation, lighting, sanitation, privacy, and proper separation of the sexes. In applying these requirements to particular dwellings, the factors to be taken into account are number of rooms per person, sanitary conveniences, floor space, window space, location, and frontage. The standard sug-

gested below is for urban industrial communities, and conforms quite closely to actual housing conditions existing in industrial centers of the country.

Number of Rooms.

Figures collected by the Bureau of Labor Statistics in the 1918-19 study indicated that the majority of workingmen's families of average size and average income lived in houses which furnished approximately one room per person. The families included in the survey were primarily Americans. No schedules were taken from non-English speaking families who had been in the United States less than five years. Families with boarders or more than three lodgers were excluded.

For 20 cities selected at random, and including all families scheduled regardless of size or income, those living in houses averaged 1.007 rooms per person, and those in flats and apartments 0.931 room per person. The standard health and decency budget must provide at the very least as many rooms per person as the average family were found to occupy. A housing standard of one room per person, exclusive of bath, has, therefore, been adopted as the minimum requirement consistent with health and decency.

For the average family of five persons a house of five rooms, consisting of living room, dining room, kitchen, and two bedrooms, should be provided as the minimum for health and decency. For the standard family, composed of husband, wife, and three children, boy aged 12, girl 6, and boy 2, three sleeping rooms are needed in order to secure reasonable privacy—one bedroom for the parents and two for the children, one for each sex. To meet this need the living room can be arranged so as to be adaptable for sleeping purposes. Several arrangements are possible. A very practical one would be to have three bedrooms, a living room, and a combination kitchen and dining room. Still another would give a combined living and dining room, kitchen, and three bedrooms, or two bedrooms and a "parlor." The latter arrangement is especially desirable as the children grow up and begin to receive visitors in the home.

Size of Rooms.

Thus far only the number of rooms has been considered. For purposes of health it may be conceded that floor space is of more importance than the mere number of rooms. The size of the various rooms adopted by the Bureau of Industrial Housing and Transportation of the Department of Labor, which undertook the war housing of the Government other than that required for shipbuilders, is given below.

	Minimum size.
Large bedroom.....	10 by 12 feet.
Small bedroom.....	8 by 10 feet.
Parlor or living room.....	10 by 12 feet.
Dining room.....	9 by 12 feet.
Kitchen (where there is no separate dining room).....	10 by 12 feet.

These standards are for the different rooms in detached, semi-detached, flat, or row houses and represent the combined judgment of 25 architects, sanitary inspectors, builders, and students of housing. It does not, however, seem advisable to incorporate in the housing

standard to be adopted rooms of exactly the size prescribed in the above specifications.

Especially is this true since the standard herewith presented permits of considerable variation in arrangement. If only two bedrooms are provided, both of them should be of the "large" type, 10 by 12 feet. For a family of five, the "small" bedroom, 8 by 10, will scarcely be practicable, unless three sleeping rooms are to be provided. Whether a combined kitchen and dining room, or a combined living and dining room, is selected, a room larger than 10 by 12 is desirable. Assuming any of the arrangements possible in a five-room house, approximately 560 square feet of floor space, exclusive of bath, is the minimum health and decency requirement for the standard family of five persons. When space is provided for bathroom, closets, hall, and storage space, the gross area of the standard house of five rooms has been fixed at 660 square feet. This gives little enough floor space for a family of five persons.

Light and Ventilation.

In the matter of light and ventilation the requirements set up by the Bureau of Industrial Housing and Transportation of the Department of Labor seem to be entirely satisfactory. The paragraphs on ventilation are as follows:

Every room to have at least one window opening directly to the outer air. Two windows in each room generally preferred; one window sufficient in small bedrooms. Each room to have a window area of not less than 12 square feet.

Cross ventilation as direct as possible to be provided for all rooms through windows, transoms, or doors; communicating door recommended between front and rear bedrooms in row houses.

Every bathroom to have window of not less than 6 square feet in area opening directly to the outer air.

Sanitation and Drainage.

In the 20 cities of the 1918-19 study of the Bureau of Labor Statistics selected, the families included over four-fifths of those in flats and apartments and over three-fifths of those in individual houses had inside water-closets. Over one-half of the families in both multiple dwellings and individual houses also had baths. It is felt that a housing standard which is to provide health and decency must include a complete bathroom, with toilet.

In connection with the standard house such drainage should be provided as will render impossible stagnant pools on the premises or the collection of water in the cellar or underneath the house.

Construction and Arrangement.

A house must, of course, be built in compliance with housing laws, local building codes, and ordinances. The roof must be water-tight, and the walls substantially and durably constructed so as to resist heat and moisture, according to the climatic conditions of the locality.

Accepting the constructional standards recommended by the Bureau of Industrial Housing and Transportation, the standard house should provide for closet or storage space. The halls, stairs, and doors should be so constructed and located as to permit of easy moving of the furniture.

Porches are highly desirable and should be durably constructed. In most latitudes the porches may be made to serve all the year around as an additional sleeping room.

Neighborhood and Surroundings.

It is presumed that the standard house for the workingman's family will be located in a neighborhood with reasonably well maintained streets, and fairly accessible to means of transportation, playgrounds, and places of amusement and recreation. What is commonly termed a "slum" would not supply the proper neighborhood surroundings for a house intended to provide the minimum requirements of health and decency.

Heat and Artificial Light.

IT HAS not seemed feasible to adopt any special form of heating for the standard workingman's house. There is a wide range of means by which adequate heating may be had. Whatever the method of heating, however, it should be such as to permit of heating the principal living room to a temperature of 68° F. in the coldest weather in any given locality. Small open grates in houses without double walls or air spaces, in States as far north as Pennsylvania, as were found in the company housing survey of the Bureau of Labor Statistics,² would not be in compliance with this standard.

Fuel consumption depends so much upon geographic location and climatic conditions that an attempt to establish minimum quantity standards seems impracticable. A definite standard for fuel would be complicated further by the various sizes and kinds of coal. In lighting, the various systems of gas, electricity, and kerosene offer another obstacle to quantity standards since the system used usually does not depend so much upon the desire of the family as upon the character and equipment of the house.

Furniture and Furnishings.

NO STANDARD quantity budget has yet been established for the upkeep of household equipment. The Bureau of Labor Statistics has, however, worked out a list of furniture, furnishings, and utensils necessary to equip completely a house of five rooms, living room, dining room, kitchen, and two bedrooms, occupied by the standard family of five persons. The list of articles, together with a brief description, is given below.

² The results of this survey are published in Bulletin 263 of the Bureau of Labor Statistics, now in press.

NECESSARY HOUSEHOLD EQUIPMENT.

Furniture.

Article.	Number.	Description.
Refrigerator.....	1	Smallest size and make sufficient in capacity for economical preservation of food and economy in the purchase of ice.
Tables:		
Dining room.....	1	Oak extension table, plain, durable quality.
Living room.....	1	Oak, plain, durable quality.
Kitchen.....	1	48-inch pine table, with 1 drawer.
Chairs:		
Dining room.....	6	Plain durable oak.
Bedroom.....	4	Strongly made.
Living room.....	4	Oak or other durable wood.
Kitchen.....	1	Painted wood.
High chair.....	1	
Rugs:		
Living room.....	2	Small Axminster rugs.
Dining room.....	1	Large Crex or Rattania.
Bedrooms.....	4	Rag or Crex rugs, 3 by 6 feet.
Gocart.....	1	Folding, with metal framework and cloth top.
Sewing machine.....	1	Standard make.
Settee or davenport.....	1	Oak or other durable wood, imitation leather upholstery.
Sideboard.....	1	Medium size, oak.
Bureaus.....	2	Plain bureau; 1 white painted bureau.
Chifonier.....	1	White painted wood.
Beds, mattresses, and springs:		
Double.....	1	Bedstead, plain (to match bureau); durable felt mattress, and spring.
Single.....	2	Each: White enameled bedstead; durable felt mattress, and spring.
Crib, mattress and spring.....	1	White enameled.

Furnishings.

Towels:		
Kitchen hand towels.....	3	Cotton.
Bath towels.....	10	Turkish.
Hand towels.....	12	Part linen.
Tablecloths.....	3	Cotton, to be hemmed at home.
Table cover.....	1	For use when table is not set.
Napkins.....	18	Part linen, 22-inch.
Blankets:		
Pair double-bed size.....	1	} Part wool.
Pairs single-bed size.....	2	
Pair crib size.....	1	
Comforts:		
Double-bed size.....	1	} Cotton, silk-aline covered.
Single-bed size.....	2	
Crib size.....	1	
Spreads:		
Double-bed size.....	2	} Good grade of rippelette, medium weight; number sufficient to provide for laundering.
Single-bed size.....	3	
Pillows:		
Ordinary size.....	4	} Mixed feathers.
Crib size.....	1	
Sheets:		
Double-bed size.....	4	} Number sufficient to provide for laundering.
Single-bed size.....	6	
Crib size.....	4	
Pillow cases:		
Ordinary size.....	8	} Number sufficient to provide for laundering.
Crib size.....	3	
Dish towels.....	8	Cotton, to be hemmed at home.
Table oilcloth.....	1	For pine table.

Utensils.

Laundry tubs.....	2	Medium size, galvanized.
Washboard.....	1	Zinc.
Wringer.....	1	Medium size.
Boiler.....	1	Medium size, with copper bottom.
Flat irons.....	3	4, 5, and 6 pound irons.
Mops.....	2	1 handle for scrub mop, and one 16-ounce dry mop.
Brooms.....	2	Good quality broom.

NECESSARY HOUSEHOLD EQUIPMENT—Concluded.

Utensils—Concluded.

Article.	Num- ber.	Description.
Dishes:		
50-piece set.....	1	Plain.
Water pitcher.....	1	Plain heavy glass.
Vinegar cruet.....	1	Do.
Oil cruet.....	1	Do.
Salt shaker.....	1	Do.
Pepper shaker.....	1	Do.
Tumblers.....	6	Plain.
Knives, forks, etc.:		
Butter knife.....	1	} Quadruple plated, plain.
Sugar spoon.....	1	
Knives.....	6	
Forks.....	6	
Teaspoons.....	12	} Good quality steel knife and fork, and sharpener.
Tablespoons.....	6	
Carving set.....	1	
Kitchen utensils:		
Refrigerator pan.....	1	Galvanized.
Ice pick.....	1	Small, with wooden handle.
Garbage pail.....	1	Galvanized, medium size.
Towel rack.....	1	Wood, with three rods.
Soap dish.....	1	Wire.
Dish pan.....	1	Enameled.
Dish drainer.....	1	Heavy wire, with plate holders.
Teakettle.....	1	Enameled.
Coffeepot.....	1	Gray enamel.
Teapot.....	1	Do.
Preserving kettle.....	1	Do.
Jelly glasses.....	36	With covers.
Fruit jars.....	36	Jars holding 1 quart.
Stewpans or kettles.....	2	Enameled.
Cake pans.....	2	Heavy, pressed tin.
Pie pans.....	2	Pressed tin.
Bowls.....	2	
Large bread pans.....	2	Pressed tin.
Bread-raising pan.....	1	Heavy tin, with cover.
Roasting pan.....	1	Medium size.
Bread box.....	1	
Frying pans.....	2	1 small pan, 1 medium-sized iron pan.
Double boiler.....	1	Enameled, holding 1 quart.
Muffin pan.....	1	Tin, for 1 dozen muffins.
Colander.....	1	Gray enamel.
Chopping bowl and knife.....	1	Medium-sized bowl, single knife.
Meat grinder.....	1	Medium.
Potato masher.....	1	Wire, with wooden handle.
Egg beater.....	1	Medium size and weight.
Grater.....	1	Tin.
Strainer.....	1	
Bread board.....	1	18 by 24 inches.
Large salt shaker.....	1	
Biscuit cutter.....	1	Tin.
Rolling pin.....	1	
Flour sieve.....	1	Medium size.
Measuring cup.....	1	Tin or aluminum.
Lemon squeezer.....	1	Glass.
Can opener.....	1	
Large knife.....	1	
Case knives and forks.....	3	
Paring knife.....	1	
Wooden spoon.....	1	
Mixing spoons.....	3	
Pancake turner.....	1	

This budget assumes the existence of an equipment of household furniture similar to the above, since it is generally true that married couples purchase the major part of their household furniture either at or shortly after marriage. Consequently, the problem is to provide only for the necessary annual upkeep.

Conclusions as to the amount necessary for the annual upkeep of furniture and household furnishings for a family of five have been based on approximately 100 schedules, showing one year's expenditures for furniture and furnishings, secured in 1918-19 by the Bureau of Labor Statistics from families consisting of husband, wife, and three children under 15 years of age, living in large Eastern or Middle Western cities, and having a total annual expenditure of \$1,500 and under \$2,100.

Inasmuch as the families studied spent annually from \$1,500 to \$2,100, they were presumably living at a fairly decent and healthful standard. Their household equipment, therefore, may be regarded as reasonably sufficient both in quantity and quality, although, of course, not luxurious. From the special study of the expenditures of these families for furniture and furnishings, the Bureau of Labor Statistics has calculated tentatively that the amount of annual upkeep of household equipment approximates 7 per cent of the total cost of purchase. In the budgets which the Bureau of Labor Statistics has prepared, the practice has been followed of ascertaining the approximate cost at current prices of the above list of household equipment and then allowing 7 per cent of the total renewal cost for annual upkeep. Such a figure, however, is of no use in determining a quantity standard, but it is a guide to the amount which should be allowed in the cost budget.

Miscellaneous.

UNDER miscellaneous expenditures a quantity standard is possible in only a limited number of items. Following are the principal miscellaneous items which must be provided for in the cost budget of the family:

Laundry work.	Amusements and recreation.
Cleaning supplies and services.	Newspapers.
Maintenance of health.	Organizations:
Insurance:	(a) Church.
(a) Life (disability).	(b) Labor.
(b) House and furniture.	Incidentals, including—
Car fare:	Tobacco.
Husband.	Telephoning and telegraphing.
Wife and children.	Stationery and postage, etc.

Expenditure for assistance with laundry work may not be considered possible in the family of an industrial worker. However, from the standpoint of health it seems that the mother of 3 children who must do the cooking for the family, the general cleaning of the house, the sewing and mending, the marketing and shopping, should be allowed assistance with the family laundry work and scrubbing, amounting to one day per week.

The following quantities seem to provide the minimum requirement of cleaning supplies and services to insure personal and household cleanliness:

Cleaning supplies and services.

Personal:	Quantity.
Toilet soap, small bar.....	90
Toothbrush.....	5
Toothpaste, tube or box.....	12
Combs, hard rubber.....	1
Hairbrushes.....	$\frac{1}{2}$
Shoe polish, box.....	6
Barber's services—	
Husband, hair cut.....	12
Children, hair cut.....	8
Household:	
Laundry soap, $\frac{1}{2}$ -pound bar.....	150
Starch, pound.....	6
Cleanser, box.....	36
Small lump sum for unspecified cleaning supplies and services, such as borax, ammonia, washing powder, bluing, insect powder, etc.	

Some allowance must, of course, be made for the maintenance of health. This item includes expenditures for physician, dentist, oculist, glasses, and drugs, including prescriptions and prepared remedies.

No definite number of doctor's visits can be assumed as necessary, but aside from the occurrence of major illnesses, colds and the various diseases of childhood will doubtless make a doctor's services necessary at some time during the year.

At least one visit to the dentist during the year for three members of the family will be necessary, and rarely does one visit prove sufficient.

There is, however, no available quantitative measurement, and the Bureau of Labor Statistics, in preparing budgets, has had to resort to the average expenditure for health of large numbers of families investigated.

In the first standard budget prepared by the Bureau of Labor Statistics provision was made for a life insurance premium sufficient to pay for a \$5,000 policy for the head of the family. This was considered the absolute minimum for protection and safety, since in the event of the husband's death it would furnish an income to the wife and children of not over \$300 a year, or \$6 a week. With the increased cost of living this amount is clearly insufficient. To give the same degree of protection as was accorded in 1914 by a \$5,000 policy, it would now be necessary for the husband to carry \$10,000. Granting that, in order to help carry the burdens of the war, the workingman and his family must make some sacrifices in their standards of living, it would certainly be inadvisable at this time to advocate a policy of less than \$7,500 for the head of the family.

It is highly important that every family should carry insurance on the family dwelling, if owned, and on household furniture. The loss of household equipment is an extremely serious matter to a family of low income. The budget should provide for the premium on a policy large enough to cover the replacement cost of the family's essential personal property in case of loss by fire.

The quantitative standard for carfares will have to be determined locally in each city for which a budget is prepared. If the husband is compelled to ride regularly to and from his work, at least 600 rides will be required.

If the wife is compelled to use a street car for shopping and marketing the necessary allowance must be made for this also.

It is impossible to establish quantity standards for amusements and recreations. The importance of recreation as a factor in healthy living need not, of course, be emphasized. It is accepted as an everyday fact. The only question is as to the character and cost of such recreation. Much wholesome amusement arises naturally within the circle of a family and its friends and costs nothing. On the other hand, the complexity of modern city life places a money price on many simple and desirable forms of amusement. Thus a picnic for a family, or a visit to the park, involves a considerable item of car fare, while a trip on the river will cost a dollar or more. Moreover, occasional visits to the moving pictures are to be expected of at least some members of a family. Thus, even though the more expensive forms of amusement and recreation, such as summer vacations, are eliminated, some expenditures for this item are absolutely necessary if a family is not to lead a completely isolated life.

One daily newspaper should be provided for the workingman's family, and at least one good magazine is indispensable for a proper standard of living.

Organizations, such as the church, and labor unions, play such an important part in the life of the average worker and his family that some expenditure on this account must be regarded as essential to normal living, but no quantitative standard can be established.

In addition to the items listed above there are a large number of other expenses, mostly small or occasional, which can not be entirely avoided by a worker's family—such, for instance, as stationery and postage, telephoning and telegraphing at times, tobacco, etc. No minimum quantities for these items can possibly be specified, and the only solution is to grant a modest sum of money to cover expenditures for incidentals.

The Government's Wage Policy During the Last Quarter Century.^a

By MARY CONYNGTON.

IN A sense the Government can scarcely be said to have had a wage policy for half a century or more. Unquestionably when, at the close of the Civil War, the salary scale was set, it was liberal as compared both with the cost of living and the prevailing wages and salaries outside of the Government service. The idea that a Government position was a "cinch," "an easy thing" became then so widespread and so deeply rooted that it lingers to this day, to the considerable detriment of the service. But having established its organization and set its scale of compensation, the Government appeared to feel that the matter was done with forever, and took no further steps except when in some particular group or division conditions arose which forced action. Thus such changes as occurred were merely alterations in specific salaries or groups of salaries, and the salary scale as a whole was almost untouched.

While prices remained fairly constant this did not matter so much, but for some time before the European War began there had been an upward tendency which brought about a relative reduction in the value of established salaries, and with the outbreak of the war this tendency was sharply accentuated. Wages and salaries which had before been satisfactory became altogether inadequate. The question of adjusting earnings to the cost of living became one of vital importance, and in private business enlightened employers on the one hand, and the more intelligent employees on the other, perceived the necessity of maintaining some relation between rates of wages and prices of commodities. Some employers adopted the policy during this period of revising wages periodically according to the fluctuations of the cost-of-living figures published by the Bureau of Labor Statistics, Dun, or Bradstreet, while others merely made advances which they considered met in a general way the needs of the employees under the changed conditions.

The entrance of the United States into the war not only increased enormously the number of employees in the Federal service, but brought the Government into close relations with labor outside of its own immediate force. Contracts for food, clothing, and munitions had to be let, and disagreements between the employers and employees engaged in producing these supplies might cause delay, with consequences to the successful prosecution of the war which no one could foresee. Consequently, in regard to these outside workers, it was necessary to have a policy and to declare it, and from the first the Government committed itself to the general principle that the

^a The tables in the following discussion, except where otherwise credited, are based on figures furnished to the Commission on Reclassification by the various bureaus, divisions, and groups concerned, and used by the commission as the basis of a series of charts prepared under the direction of Dr. C. D. Jarvis, of the Bureau of Education. One of these charts is given on page 31 and one on page 33.

worker is entitled to a living wage, and that to insure his getting this, wages must rise proportionately with the cost of living.

The War Department announced this policy in regard to outside workers during the first year of our participation in the war. In General Order No. 13, issued by the Chief of Ordnance, November 15, 1917, the following section appears:¹

Wage standards.—Standards already established in the industry and in the locality should not be lowered. The minimum wage rates should be made in proper relation to the cost of living, and in fixing them it should be taken into consideration that the prices of necessities of life have shown great increases.

The National War Labor Board, created especially to deal with labor difficulties, indorsed the principle unreservedly, and based numerous decisions upon it. In a number of instances the board specifically provided for periodic revision of its findings, in order that wages might be adjusted to the fluctuations of the index figure of the cost of living, as worked out by its staff or by the Bureau of Labor Statistics. In one of its early awards it explicitly declares its policy. After decreeing an increase in wages, the award continues:²

The wage scale adopted here is based upon the present cost of living. On January 1 and July 1 of each year during the war and for six months thereafter, there shall be an adjustment of wages which shall automatically take place on the above dates, provided the Government statistics show an increase in the cost of living of not less than 10 per cent of the cost on July 1, 1918, in which case the employee shall receive an increase in wages equal to the said increase in cost of living. Should said statistics show a decrease of not less than 10 per cent in the cost of living, then the rate of wages shall be correspondingly decreased.

Another Government agency, the so-called Macy Board, which was established to handle wage matters in the shipyards of the country, also announced a definite policy of periodic adjustments of wages during the war. Such adjustments were to take place on October 1 and April 1, provided a material change in the cost of living had taken place since the last adjustment date.³

These were all wartime measures, but the Government has formally recognized the principle since the signing of the armistice. At the time of the soft-coal strike last winter the Fuel Administrator, though openly and bitterly opposed to the demands of the men, admitted that they might fairly claim an advance proportioned to the increase in cost of living, and fixed a rate which according to his calculation met this condition. Along the same line the Esch-Cummins bill, adopted in February by both Houses of Congress, definitely instructs the Railroad Labor Board, when fixing rates of pay for railroad workers, to take into consideration the relation between wages and the cost of living.

¹ Labor policy of the War Department, MONTHLY REVIEW, December, 1917, p. 52.

² National War Labor Board, Docket No. 35, *Employees v. Manufacturers of Newsprint Paper*. Award rendered June 27, 1918.

³ For a full statement of this policy see the awards of the Macy Board rendered October 24, 1918, establishing a uniform wage scale for shipbuilding workers. MONTHLY LABOR REVIEW, December, 1918, pp. 197-212.

Salaries of Government Employees, 1893 to 1919.

SO FAR as the general principle is concerned, then, the Government has placed itself on record as in favor of a definite relation between compensation and cost of living, this relation to be maintained by periodic revisions of compensation in order that the employee may not be adversely affected by increases in the cost of living, nor reap the whole benefit of decreases in that cost. In practice, however, so far as its own employees are concerned, the Government has shown no desire to translate this principle into action. In the tables which follow the average salaries paid to Government employees in the District of Columbia are for fiscal years beginning July 1 of the year shown. The indexes of retail prices of food are based on data furnished by the United States Bureau of Labor Statistics, and are for calendar years.

Table 1 relates to average salaries of all Government employees in the District of Columbia.

TABLE 1.—NUMBER AND AVERAGE SALARY OF GOVERNMENT EMPLOYEES IN THE DISTRICT OF COLUMBIA, 1893 TO 1919, AND PURCHASING POWER OF SALARY IN RELATION TO 1893 SALARY.

[The 1917 and 1919 average salary figures do not include the bonus. Those for 1919 include, however, the salaries of workers in the new organizations growing out of the war who came in at a higher level of salaries than prevailed in the older establishments and they also include certain salaries of Navy employees whose salaries were adjusted by the Henry award.¹ For the older Government employees these factors tend to offset the omission of the bonus and make the table a reasonably accurate statement of what has happened to them. The average salaries are based on figures given in the Official Register.

Year.	Number of employees.	Average salary.	Index of retail prices of food.	Purchasing power of salary in relation to 1893 salary.	Average salary necessary to maintain purchasing power of 1893 salary.
1893.....	14,919	\$1,096	100	\$1,096	\$1,096
1895.....	13,615	1,114	94	1,185	1,030
1897.....	16,182	1,073	92	1,166	1,008
1899.....	19,446	1,009	96	1,051	1,052
1901.....	23,160	1,040	101	1,030	1,107
1903.....	23,757	1,067	106	1,007	1,162
1905.....	25,481	1,065	107	995	1,173
1907.....	28,947	1,090	115	948	1,260
1909.....	30,768	1,105	125	884	1,370
1911.....	36,975	1,109	130	853	1,425
1913.....	36,289	1,134	141	804	1,545
1915.....	38,571	1,141	142	804	1,556
1917.....	45,706	² 1,184	206	575	2,258
1919.....	91,791	² 1,321	259	510	2,839
Increase in average salary, 1919 compared with 1893, 20.53 per cent.					

¹ The Henry award differed from the Macy awards in that the latter dealt with the employees of the privately-owned shipyards working for the Government while the former dealt with Government employees. Its terms demanded higher qualifications in the architects and draftsmen affected than was the case with the Macy awards.

² Not including bonus. Exact data on which to compute the average bonus were not available, but the Reclassification Commission Report states (p. 41) that \$216 is a fair amount to allow for average bonus in 1919.

It is very evident from this table that in regard to its own employees the Government has given little attention either to the necessity of paying a living wage, or to the desirability of salary revisions to maintain the due relation between compensation and cost of living. If the average salary of \$1,096 was fair and reasonable in 1893, the average salary of \$1,321 in 1919, representing only half the purchasing value of the salary of 1893, is unfairly and unreasonably low. Nor have the variations which the average shows borne any material relation to the fluctuations in prices. From 1893 to 1911 the average salary varied within a range of only \$105, and at the latter date was only \$13 higher than at the beginning of the period. Meanwhile retail prices, taking the index figure of 1893 as the base, had fallen to 92 in 1897 and then risen to 130 in 1911. Owing to the fall in prices, the Government employee was for some years relatively better off than he was in 1893, but from 1901 onward his condition grew steadily worse, and from 1915 onward the deterioration was exceedingly rapid. It is true that while the average salary was \$1,141 in 1915 it had become \$1,321 in 1919, an increase of \$180, or 15.8 per cent, but during this same time the index figure of retail prices of food had risen from 142 to 259, an increase of 82.4 per cent. As shown on page 63 of this issue of the REVIEW, retail prices of food in April, 1920, were 113 per cent higher than in June, 1915.

There is always some question as to whether a comparison covering so long a period as shown in this table is entirely fair. The force in 1919 was much larger than in 1893, the range of the Government's activities had been much widened, and there is no assurance that the work done by the typical Government clerk in 1919 was the same in character as it was in 1893. It is sometimes asserted that the demand on the rank and file of the employees is not so great now as it was in the nineties; the work has been much more specialized, with the result, it is said, that the ordinary worker is not required to have as much initiative or as varied abilities as in the earlier days. It is possible that there is some truth in this contention, but there are two facts to be set against it when the adequacy of the present salary scale is under consideration. The scientific work of the Government has been greatly extended since 1893, so that it now employs a much larger force of highly trained scientific and technical experts, who should normally be highly paid men, and whose salaries should tend to bring up the general level. For the rank and file, there has also been a marked increase in the intensity of work required. Hours have been lengthened, privileges curtailed, and much more persistent and strenuous effort required than was the case 27 years ago, when relatively the salary scale was materially higher than now.

Of course it is not possible to say whether these latter considerations exactly counterbalance the first, so it is worth while to examine the salary changes of some smaller groups, selected because in their cases it has been possible to make sure that there has been no material change either in the character of the work done or, usually, in the manner of doing it.

Table 2 shows the average salaries since 1897 for a group in which there has been little change, the assistants in the reading room and catalogue divisions of the Library of Congress.

TABLE 2.—NUMBER AND AVERAGE SALARY OF ASSISTANTS IN THE READING ROOM AND CATALOGUE DIVISIONS OF THE LIBRARY OF CONGRESS, 1897¹ TO 1919, AND PURCHASING POWER OF SALARY IN RELATION TO 1897¹ SALARY.

Year.	Number of employees.	Average salary.	Index of retail prices of food. ²	Purchasing power of salary in relation to 1897 salary.	Average salary necessary to maintain purchasing power of 1897 salary.
1897 ¹	28	\$1,200	100	\$1,200	\$1,200
1898	28	1,200	103	1,165	1,236
1899	48	1,023	105	974	1,260
1900	81	899	106	848	1,272
1901	102	890	111	802	1,332
1902	126	957	115	832	1,389
1903	126	957	116	825	1,392
1904	126	957	117	818	1,404

1918	134	982	258	381	3,096
1919	134	982	283	347	3,396

Decrease in average salary, 1919 compared with 1897, 18.17 per cent.

¹ Year organized.

² As 1897 is the earliest year for which data as to salaries of Library of Congress employees are available, it was necessary for comparative purposes to use retail prices of food for that year as the base, or 100, in calculating the index numbers shown in this column. These index numbers, therefore, do not agree with the index numbers of prices shown in other tables of this series which are based on prices in 1893=100.

³ Not including bonus. With bonus average salary was \$1,222 in 1919.

The marked drop in the average salary beginning in 1899 was due to the enlargement of the force and the creation of a number of low-salaried positions. Owing to this change, a comparison of 1897 with 1919 may be unfair, but either 1901 or 1902 might legitimately be taken as a basis of comparison. Since 1901 the number of workers has increased by 32, but since 1902 by only 8. Including the bonus, the average salary shows an increase of 37.3 per cent since 1901, and of 27.7 per cent since 1902, while the index figure of retail prices, the figure of 1893 being taken as a basis (see Table 1), has risen from 101 in 1901, and 106 in 1902, to 259 in 1919. The increase in the average salary of these workers comes very close to that for the whole body of workers, as given in Table 1, which shows that the average salary in 1919 amounted to 27 per cent over the average for 1901, and 23.8 per cent over that for 1903. The average salary of the library assistants in 1919, however, would be lower than the figure here given were it not that at the present time a number of the more poorly paid positions are vacant, it being impossible to secure workers at the salaries they carry.

Tables 3 and 4, dealing with the hydrographic and geodetic engineers, and the naval architects and draftsmen, present an interesting contrast, showing how largely the Government is influenced in its treatment of salaries by outside conditions.

TABLE 3.—NUMBER AND AVERAGE SALARY OF HYDROGRAPHIC AND GEODETIC ENGINEERS OF COAST AND GEODETIC SURVEY, 1893 TO 1919, AND PURCHASING POWER OF SALARY IN RELATION TO 1893 SALARY.

1919.....	143	2,498	259	965	3,864
Increase in average salary, 1919 compared with 1893, 67.43 per cent.					

¹ Not including bonus; figures not available.² Not including bonus. The advance in salary received in 1918 made most of these employees ineligible for the bonus. In 1919 they came under the Henry award, receiving another increase, but being excluded from the bonus.

In 1893, it will be observed, the hydrographic and geodetic engineers had a considerably better standing than the naval group, their average salary being \$2,065 against an average of \$1,492 for the architects and draftsmen. From 1898 to 1901 the engineering group was undergoing a process of adjustment, the number being increased and the average salary lowered, but by 1901 both numbers and salary had reached a relatively stationary position. At this time their average salary, \$1,588, was somewhat below that of the naval group in 1900, the nearest comparable date, and so it remained until war conditions materially changed the status of the latter. The effect of the war, even before the United States entered it, was to cause a great expansion of the Navy's building program, which necessitated bringing into the service a much larger number of architects and draftsmen than had previously been employed. These, coming in at the entrance rates, lowered the average salary from \$1,798 in 1915 to \$1,626 in 1916 and \$1,552 in 1917. But our entrance into the war created a tremendous demand for these architects and draftsmen, and in order to keep its men at all the Government simply had to raise its scale, so that in 1918 the average became \$2,032. The following year the group came under the Henry award, and the average rose to \$2,498, an increase of 53.6 per cent over the average of 1916 and of 67.4 per cent over that of 1893. Even this increase, however, fell noticeably below that of the price index figure. Meanwhile, the hydrographic and geodetic engineers fared but poorly. Outside the Government service there is little demand for their kind of work, so that the coming of the war with its accompaniment of soaring prices brought no increased competition for their services. Consequently, no particular attention was paid to their needs, and their basic salary in 1919 was actually lower than in 1893 and only 15.6 per cent higher than in 1901, the year in which the process of readjustment of numbers and salaries might be looked upon as complete.

Both of these groups—the engineers and the architects—are composed of skilled and trained men. Neither received increases of salary proportionate to the increased cost of living, but the difference in their relative positions in 1919 is a striking commentary on the lack of a governmental policy of salaries. In one case there was strong outside competition for the services of the employees, and the Government accordingly increased salaries; in the other there was no such competition and salaries remained almost unchanged. The relation of the salaries to the cost of living or to the skill and training required of the worker apparently played no part in either case.

Table 5 shows the average salaries of the adjudicating clerks of the General Land Office. The duties of this group have been practically the same for the past 27 years.

TABLE 5.—NUMBER AND AVERAGE SALARY OF ADJUDICATING CLERKS, GENERAL LAND OFFICE, INTERIOR DEPARTMENT, 1893 TO 1919, AND PURCHASING POWER OF SALARY IN RELATION TO 1893 SALARY.

Year.	Number ^a of employees.	Average salary.	Index of retail prices of food.	Purchasing power of salary in rela- tion to 1893 salary.	Average salary necessary to maintain pur- chasing power of 1893 salary.

1916.....	172	1,566	161	973	2,372
1917.....	162	1,585	206	769	3,034
1918.....	173	1,553	237	655	3,491
1919.....	170	1,571	259	606	3,815

Increase in average salary, 1919, compared with 1893, 6.65 per cent.

^a Not including bonus. With bonus average salary was \$1,649 in 1917, \$1,673 in 1918, and \$1,811 in 1919.

The group shows singularly little change, either in numbers or in salary, since 1893, the number of employees having decreased by nine, and the average basic salary having risen by \$98 in the period covered. This increase is due partly to a slightly higher minimum salary, and partly to the fact that the lower-paid positions are only partially filled, it being impossible to get a full complement of workers at the salaries offered. Including the bonus, the average salary of this group shows almost exactly the same increase over that of 1893 as is shown in Table 1 for the Government employees as a whole—22.9 per cent against 20.5 per cent.

Table 6 shows the average salaries of the geologists of the Geological Survey. The fact that the average salary in 1893 was well over \$2,000 is a strong indication of the value set upon their services at that time. The importance of their work has not declined, but the increase in the average salary is small, and is partly due to the separation of the lower-paid men from the service. The demand for geologists outside the Federal service is increasing, but has not yet become sufficiently direct and pronounced to raise Government salaries as it did in the case of the naval architects.

Tables 7 and 8, dealing with the compositors and pressmen of the Government Printing Office, are interesting as showing the influence of outside demand, which in its turn is obliged to meet the conditions decided upon by a strong union.

TABLE 6.—NUMBER AND AVERAGE SALARY OF GEOLOGISTS, UNITED STATES GEOLOGICAL SURVEY, INTERIOR DEPARTMENT, 1893 TO 1919, AND PURCHASING POWER OF SALARY IN RELATION TO 1893 SALARY.

Increase in average salary, 1919, compared with 1893, 87.42 per cent.					

¹ Not including bonus. With bonus average salary was \$2,118 in 1919; average for 1917 and 1918 not computed.

It will be noticed that between 1902 and 1908 the compositors show a marked falling off in numbers, and that from the latter date onward there is relatively little variation in this respect. This change was due to the introduction of typesetting machines, by which much the greater part of the typesetting is now done. Nevertheless, some kinds of typesetting are still done by hand, and in order to make a fair comparison, the salary figures have been limited to those who were kept on at this handwork. In the years when the change to the machines was being made the number of the handworkers naturally declined rapidly, but this was the only change in the group, the work done having remained the same throughout the period covered. The pressmen show the same stability as the compositors in character of work done. The presses of to-day are larger, have more cylinders and run at greater speed, but the kind and degree of skill required of the pressmen are the same.

For these two groups, then, the character of work done has remained absolutely unchanged since 1893, and up to 1917 the same might almost be said of their wages. For the compositors the average salary remained stationary from 1899 to 1917; for the pressmen there was a slight increase in 1912, after which the salary was unchanged until 1918. In the case of both groups, however, the Government has been obliged within the last few years to meet strong outside competition, and as the only apparent means of keeping up the force in the Government Printing Office the union

wage scale was adopted. As a result, these two groups, both receiving the scale of wages that prevails outside, show a greater percentage increase than any of the others considered.

Table 9 brings together the average salaries of groups previously considered and several others not yet mentioned, showing the degree to which the average salary has been increased since 1893, and its level at four different periods.

TABLE 9.—AVERAGE SALARIES OF TYPICAL GROUPS, VARIOUS FISCAL YEARS, 1893-4 TO 1919-20.

¹ Figures are for 1897, date of organization.

² Per cent of increase over 1897.

³ Not including bonus; figures not available.

⁴ Not including bonus figures; bonus not allowed.

It will be noticed that all of the groups, after they had passed through an organization or reorganization period, tended to become nearly stationary, both as to numbers and salary, until the outbreak of the war brought about changes in most, though not quite all, of them. It is evident that the increases in salary shown have no general underlying principle, and have not been made in accordance with any clearly defined policy. The salary advances received differ considerably from group to group, and are very much higher for the groups representing skilled labor than for those in the clerical and the scientific and technical services. Excluding the copyright clerks and assistants of the Library of Congress, since for them the period of comparison should really begin with the present century, the increases shown for the clerical groups range from 20.54 per cent to 24.24 per cent. In the scientific and technical services, excluding the one group over which the Government came into direct competition with outside employers the range is from 7.74 per cent to 33.37 per cent: including that group, to 67.43 per cent. The two groups from the Government Printing Office, who received the full benefit of outside competition, show an increase of 111.38 per cent. Meanwhile, retail prices show an increase during the period of 159 per cent.

It will be seen that the salaries of these groups, selected for study because it was definitely known that the character of their work had not changed materially in the period covered, do not support the theory that the fall in the real value of the average salary of the Government employees as a body corresponds to a lower standard of requirements which justifies the decrease. But to test the matter still further, another comparison was made. It will hardly be said that the Government's demands, in those bureaus and divisions existing before the war, have altered materially within the past five years, and that its employees deserve relatively a much lower salary to-day than they received in 1915. Yet the purchasing power of their salaries has fallen materially since 1915, as shown in the following chart, which shows for a number of groups of Government employees the salary increases since 1915 as compared with the increase in retail prices of food.

Here, again, there is clear evidence of the lack of any policy underlying the changes. Evidently the increases have not been planned to compensate for the increasing price of food, for in only two cases is the percentage increase in salary even half as great as that in food prices. And they can not have been proportioned to the value of the services rendered, or the compositors and the pressmen would not show such a large percentage increase, and these two would not lead the rest so distinctly. The only conclusion that can be drawn from these varied rates of increase is that the Government raises salaries only when it is forced to do so in order to keep its employees, and then only so far as will enable it to withstand outside competition. When there is no such competition, as, for instance, when the Government is the only employer for some line of scientific or technical work and there is therefore little chance for the worker outside, salaries tend to remain stationary, or are advanced slowly and uncertainly to an extent which is wholly insufficient to meet the increase in the cost of living. This policy of

drift is the more easily followed because Government employees have never shown any inclination to strike, have only recently organized themselves into a union, and have made it one of the basic principles of that union that they shall neither themselves strike nor be called upon to support any strike against the Government.

CHART A.—INCREASE, 1915-1919, IN AVERAGE SALARY OF SPECIFIED GROUPS OF GOVERNMENT EMPLOYEES COMPARED WITH INCREASE IN RETAIL PRICES OF FOOD. AVERAGES INCLUDE BONUS.

Government Salaries Compared with Wages in Industry.

HOW THE Government employee fares as compared with workers outside the service is revealed to some extent in Table 10 and Chart B, which show the relative increases secured since 1915 by the Government force as a whole, and by certain classes of skilled and unskilled workers outside. In this table and chart the index numbers and the line representing retail prices of food are based on figures furnished by the United States Bureau of

Labor Statistics. The index numbers and the line representing average earnings in New York State factories are based on the average weekly earnings as given in the Labor Market Bulletin published by the Bureau of Statistics of the New York State Industrial Commission for January, 1919, page 8. The index numbers for carpenters, hod carriers, machinists, painters, and structural iron workers (lines 3, 4, 5, 6, and 7) are based on the union rates for these occupations given in the MONTHLY LABOR REVIEW for November, 1919, pages 172 to 190, the rates for each trade being averaged for the cities of Baltimore, Boston, Newark (N. J.), New York, Philadelphia, and Washington. The index numbers for railroad employees (line 2) are based on figures given out by the Director General of the Railroad Administration and published in the MONTHLY LABOR REVIEW for December, 1919, page 230; they cover all railroad employees paid at an hourly rate. The index numbers and the line representing the salary rates of the Government employees are based on figures given in the Official Register and do not include bonuses. According to the report of the Reclassification Commission the average bonus paid to Government employees in 1919 was about \$215.

TABLE 10.—RELATIVE ANNUAL SALARIES OF U. S. GOVERNMENT EMPLOYEES, HOURLY RATES OF RAILROAD EMPLOYEES AND OF SKILLED AND UNSKILLED WORKERS (UNION SCALE), WEEKLY EARNINGS OF NEW YORK STATE FACTORY EMPLOYEES, AND RETAIL PRICES OF FOOD, 1915 TO 1919.

Group of employees.	1915	1916	1917	1918	1919
Government employees.....	100.0	(¹)	² 103.8	(¹)	² 115.8
Carpenters.....	100.0	102.6	114.0	124.1	155.2
Structural iron workers.....	100.0	104.4	112.8	131.7	155.6
Painters.....	100.0	107.5	114.7	140.3	178.8
Hod carriers.....	100.0	96.3	118.9	146.7	182.9
New York State factory employees.....	100.0	108.8	122.8	135.1	185.1
Railroad employees.....	100.0	101.9	117.8	170.0	197.0
Machinists.....	100.0	113.7	135.2	166.0	197.7
Retail prices of food ⁴	100.0	113.0	145.0	166.0	182.0

¹ Not reported.

² Not including bonus.

³ Not including bonus but including salaries of workers in the new organizations growing out of the war, who came in at a higher level of salaries than prevailed in the older establishments, and also salaries of certain Navy employees adjusted by the Henry award. The Reclassification Commission estimates that the average bonus of Government employees in 1919 was about \$215.

⁴ It should be noted that prices for 1915 are taken as the base or 100; therefore, the relative retail prices or index numbers of food do not agree with those shown in preceding tables which, with the exception of those in Table 2, are based on prices for 1893=100.

The comparison in Table 10 and Chart B is not a wholly satisfactory one, since most of the relative figures in the table and the corresponding lines in the chart represent rates of pay, not earnings, whereas the line for the Government employees, whose salary is on a yearly basis, represents earnings as well as rates. Against this may be set the fact that during the last two years of the period covered, during which the increase in rates is particularly marked, there was a scarcity of workers, so that unemployment was rare, and overtime, generally at increased rates, was common. Owing to these conditions, the discrepancy between rates and earnings was diminished if not wholly overcome. Also, line No. 6, showing earnings, is strictly comparable with the line showing increases received by the Government employees. It must be remembered that the relative figures

CHART B.—INCREASE, 1915-1919, IN AVERAGE SALARY OF GOVERNMENT EMPLOYEES, COMPARED WITH INCREASE IN RETAIL PRICES OF FOOD, EARNINGS IN NEW YORK STATE FACTORIES, AND WAGE RATES OF CERTAIN SKILLED AND UNSKILLED WORKMEN.

while showing percentage increases, show nothing as to the absolute condition of the recipients. For instance, the percentage of increase between 1915 and 1919 is almost identical for the railroad employees and the machinists, but the actual average hourly rates for the two groups during this period were as follows:

Group of employees.	1915	1916	1917	1918	1919
Railroad employees.....	\$0.270	\$0.275	\$0.318	\$0.459	\$0.532
Machinists.....	.359	.408	.486	.596	.710

The difference in the advances received by the Government workers and the other classes considered is too great to need emphasizing. The average Government salary of 1919 showed an increase over that of 1915 of nearly 16 per cent; rates for carpenters and structural-iron workers, an increase of 55 per cent; for painters, 79 per cent; for hod carriers, 83 per cent; earnings in New York State factories, 85 per cent; rates for railroad employees, 97 per cent; and for machinists, 98 per cent. Lines No. 6 and No. 7 show specially interesting contrasts with the line of the Government workers. Line No. 6 shows that the earnings of the New York factory employees were increased by a percentage more than five times as great as that gained by the Government workers. Line No. 7, representing the rate increase of the railroad employees presents an even more interesting contrast, because the greater part of the increase shown was received while the roads were under Federal control. The rise in the cost of living could not affect the railroad worker more than it did the other Government employees. But the railroad men were strongly organized, they were not habituated to the static condition of Government employees, they were quite accustomed to enforcing their demands by a strike or the threat of a strike, and the conditions prevailing from 1917 to the end of the war would have made a strike peculiarly disastrous. These may not have been the sole reasons for the difference in treatment, but certain it is that the rates paid by the Government in 1919 averaged more than 90 per cent higher than the rates for 1916, the last year in which the roads were under private control, and that during the same period the average salary of the Government employees showed an increase of not quite 16 per cent.

Conclusion.

SURVEYING the whole situation, it does not seem too much to say that the Government's only policy in regard to wages has been to have no policy. As shown by its pronouncements during the war in regard to labor troubles, it recognizes in theory the advantage of establishing liberal scales of compensation for work of standard quality, and the necessity for frequent revisions of the wage or salary scale in order that a due relation may be maintained between cost of living and earnings. But in practice it has shown a complete obliviousness of both considerations. During the whole period covered by the accompanying charts, there has been no general revision of the salary scale, and such advances as have been made have varied

according to the degree of pressure which the employees or outside circumstances have brought to bear upon the Government. The advances have never been proportioned to the increased cost of living except in the one case of the railroad employees, where the Government was dealing with a strongly organized body, able to enforce its claims by drastic action and quite prepared to do so.

There is not the slightest reason to suppose that this lack of policy on the Government's part is due to an attitude either of hostility or of indifference to the employees. It seems rather to be an illustration of the truth of the old adage that what is everybody's business is nobody's business. There is no one responsible body charged with the duty of seeing that the Government pays fair salaries and adjusts them from time to time in accordance with changes in the cost of living and in the value of the work done. The final responsibility for salaries rests with Congress, but Congress has no definite machinery for keeping itself informed upon the question. Generally speaking, whenever a special body has been created to deal with questions of compensation outside of the Government service, it has shown a tendency to handle the matter in a liberal and progressive spirit. Is there any reason to suppose that it would be otherwise were it dealing with the same questions within the service? If a commission or other responsible body were created, charged with the special duty of supervising the compensation and employment conditions of the United States' employees and recommending to Congress from time to time such changes as it considered were required by changing circumstance, it is not too much to suppose that the present policy of drift would disappear, and that the Government would take its place as an enlightened and progressive employer.

Mobility of Labor in American Industry.¹

By PAUL F. BRISSENDEN and EMIL FRANKEL.

THE difficulty of maintaining a stable work force in industrial establishments has directed attention to the problem of labor instability—a phenomenon observable in a particularly intensified form in times of prosperity, but found to be only slightly less serious even in periods of depression. Labor instability is regarded by all those who have given any serious consideration to the problem as one of the maladjustments of our industrial life, wasteful and destructive of the potential man power of the Nation and a serious obstacle to the complete utilization of the country's productive forces. In tackling this problem it should be recognized at the outset that within certain limits establishment labor mobility is a normal and necessary thing. A certain amount of shifting from shop to shop and city to city is quite normal and even desirable; part of this necessary movement of labor is an entirely natural ebb and flow resulting from the normal expansion and contraction of industrial activity. Interest in the question of labor mobility is centered, therefore, not only upon its general extent but more specifically upon whatever part of it may be considered abnormal and unnecessary. When it is considered from this standpoint it is essential to know (1) the nature and extent of labor instability, (2) the various factors which are likely to increase or diminish its volume, and (3) whether any employment methods have been or can be devised which will make it possible to reduce labor instability to such an extent that maximum production may be attained at minimum cost and to the mutual advantage of employer and employee.

In order, however, to give really adequate consideration to the various problems involved in labor instability as it affects different industries in the United States, and more particularly to devise methods for its reduction, it will be necessary to have more detailed and extensive data than have hitherto been available. Fortunately during the last decade a number of progressive firms have given rather close study to the whole problem of labor instability, have made extensive experiments in labor management with a view to stabilizing the work force, and have achieved a measure of success. It is upon data from such establishments that the analytical and descriptive matter of the forthcoming report is very largely based.

Labor instability is generally the consequence of (1) seasonal, cyclical and other fluctuations in industrial activity which result in varying amounts of employment available to the job seeker; (2) individual or collective dissatisfaction with the conditions of employment; and (3) the dissatisfaction of employers with the services of some employees. In its relation to employer and employee this problem of labor instability becomes a more or less personal one and presents itself essentially in two aspects, depending upon whether it is the employee or employer who is concerned: (1) To the individual workman job changing may mean either gain or loss. In prosperous times, when there are more numerous and attractive job

¹ This article is a summary review of a bulletin on this subject soon to be published by the Bureau of Labor Statistics.

opportunities, the change of jobs may represent an actual gain to the worker. Even if there is nothing gained by it it could hardly involve a loss, because in a rising market jobs are likely to be actually awaiting the separating employee and even at the worst the period of unemployment between jobs is likely to be relatively short. In periods of depression the establishment labor mobility problem is for the individual employee a problem of unemployment or irregular employment, the employee becoming the unwilling sufferer from the instability and less commonly the willing cause of it. (2) The individual employer, however, is chiefly interested in the maintenance of a stable working force and regards excessively numerous terminations of employment and, especially, voluntary and more or less avoidable separations as a serious obstacle to efficient and continuous operation. He is also very much concerned with the enormous expense to which he is put because of the excessive labor replacement required for the maintenance of his normal work force.

In the forthcoming report, as well as in this article, the problem of labor instability is taken up, primarily, from the standpoint of the individual establishment. This is done not because labor mobility from the standpoint of the individual workman is less deserving of consideration, but solely because, as has been explained, the data necessary to the study of this subject were readily available only from the records of those establishments which have made serious attempts to cope with the problem of instability.

The objects of the investigation were: (1) To show the general extent of labor mobility in industrial establishments in the United States from 1910 to 1920; (2) to indicate the relative extent of labor mobility in the various industries and localities and in different subdivisions of the work force; (3) to show the relative stability of the work force in those establishments which have been noticeably successful in dealing with the problem of labor instability as compared with the labor instability prevailing in the general run of establishments reporting; and (4), by describing the employment methods used by those establishments which have been most successful in reducing the number of their labor changes, to demonstrate the practical effectiveness of certain labor policies and well-conceived systems of labor management, including general personnel and welfare activities.

Definition and Measurement of Labor Mobility.

ANY adequate comparison of establishment experience in dealing with labor instability, as well as any clear presentation of the relative extent of that instability in different plants, makes a uniform use of terms and a uniform standard of measurement absolutely necessary. The complex problem of labor instability can not be adequately or clearly presented by use of a phrase of such necessarily narrow and specialized connotation as "labor turnover," which has hitherto been loosely used in reference to establishment labor instability generally. It has been decided to use the term "labor turnover" in one sense and one only, and that strictly in reference to the extent of shift and replacement necessary for maintenance of force. This aspect of the matter is the one with which employers

of labor are most intimately concerned. For use in reference to the larger aspect of the flow of industrial workers into and out of industrial establishments, of which labor turnover or replacement is only one phase, a more inclusive term needs to be used. The whole phenomenon of the movement of labor into and out of industrial establishments is referred to here as "labor mobility."² "Labor turnover," as just explained, is used strictly and solely in reference to replacements. Those hired are referred to as "accessions." Those leaving service, under whatever circumstances, are referred to as "separations." Whichever one of these two items—accessions or separations—is the smaller may conveniently be taken as measuring the number of replacements. The total number of labor changes—that is to say, the sum of the accessions and separations—is the "labor flux." The amount by which the accessions in an expanding business are in excess of the separations is the amount of "labor increase." The amount by which the separations in a plant which is curtailing operations exceed the accessions is the amount of "labor decrease."³

The exact method of measuring labor mobility as adopted by the Bureau in the forthcoming report may be briefly outlined as follows: The general extent of labor mobility is statistically determined by comparing the labor flux—that is, the total movement of labor in and out (accessions and separations)—during any given period with the number of labor hours put in by the work force during that period. This flux rate is believed to be the best single index figure to use in showing the general stability situation in any plant or group of plants and in subdivisions within individual establishments. The flux rate is made up of the accession rate and the separation rate. The two latter rates should be shown separately in order to reveal the whole stability situation. The rate of replacement, or "turnover," which means the rate at which separating employees whose places must be filled are replaced by others, may be, for all practical purposes, defined as, and identified with, the rate of separation when that rate is lower than the accession rate and as the rate of accession when that rate is lower than the separation rate. Furthermore, the separation rate should be subdivided so as to show the relative responsibility of discharges, lay-offs, and quits for the total labor outflow. The more important mobility rates may be classified as follows:

Labor mobility rates	{ flux rate	{ accession rate.
		{ separation rate { quitting rate.
	{ replacement (or "turnover") rate.	

In the forthcoming bulletin these different mobility rates are shown, with one or two exceptions, as rates per 10,000 labor hours.⁴ For illustration: The figures in Table 2 (p. 41) show that during the

² The term "labor mobility" primarily connotes movement. From the employer's standpoint, however, it will sometimes be convenient to refer to this condition as "instability," or even to use the word "stability," where that word seems to be appropriate.

³ The relations between accessions, separations, replacements, and flux may be seen from the tabular presentation of them all in Table 2.

⁴ The 10,000-labor-hours base is the one which has recently been adopted by the Bureau of Labor Statistics for the computation of industrial accident frequency and severity rates. (For details see the MONTHLY LABOR REVIEW, January, 1920, pp. 218, 219.)

year ending May 31, 1918, the sum total of accessions and separations for the 176 establishments reporting was 1,244,640. The number of labor hours worked in these plants during this period was 917,703,000. Consequently—

the flux rate is	$\frac{1244640 \times 10,000}{917703000} = 13.6$
the accession rate is	$\frac{631173 \times 10,000}{917703000} = 6.9$
and the separation rate ⁵ is	$\frac{613467 \times 10,000}{917703000} = 6.7$

The rates for any departmental, occupational, or other subdivision of the work force should be figured in a similar way. Thus, for example, to get the accession rate for a particular department or occupation divide the number hired during the period covered by the number of labor hours worked in the same group during that period and multiply by 10,000.

The relation between the three principal methods which have been used hitherto in labor-turnover computation is shown in the following table:

TABLE 1.—COMPARISON OF THREE METHODS OF MEASURING LABOR MOBILITY.

Year.	Accession.	Separation.	Labor flux.
Rate per 10,000 labor hours.			
1913-14.....	3.1	3.3	6.4
1917-18.....	6.9	6.7	13.6
Rate per full-year (3,000-hour) worker.			
1913-14.....	0.9	1.0	1.9
1917-18.....	2.1	2.0	4.1
"Percentage of turnover" (Rochester method).			
1913-14.....		100	
1917-18.....		200	

A separation rate of 1.0 per full-year (3,000-hour) worker, as the Bureau of Labor Statistics has lately computed mobility rates, or a separation rate (called according to the Rochester method "percentage of turnover") of 100 per hundred on the work force, as the Bureau formerly figured "turnover," are both equivalent to a separation rate of 3.3 per unit of 10,000 labor hours as used in this report. Conversely, a separation rate of 6.7 per 10,000 labor hours as used in this report is equivalent to a separation rate of 2.0 per full-year worker and to a "percentage of turnover" (Rochester method) of 200. The flux rate for 1913-14 on the new basis explained above is 6.4, which is the same as a flux rate of 1.9 per full-year

⁵ It is evident, in this particular example, that the separation rate, being lower than the accession rate, must also be the replacement rate.

worker. Such a rate indicates that during the period under observation the sum total of the number hired and leaving is about equal to twice the number of full-year workers employed.

Scope and Limitations of the Basic Data.

THE forthcoming report is based primarily upon information secured by agents of the United States Bureau of Labor Statistics in the course of two extensive field investigations of the subject; a prewar inquiry made in 1915 and 1916 and reporting in a general way the extent of turnover during the 5-year period 1910-1915 and in more detail for the years 1913 and 1914, both the extent of it and the efforts made to reduce it; and a war-time investigation made in 1918, resulting in an intensive report of the mobility situation for the 12-month period ending May 31, 1918. By the use of material secured by correspondence some of the data from these field investigations have been brought down to the end of 1919. Returns from the two inquiries cover upwards of 260 establishments, employing over 500,000 workers, in 17 of the most important industrial States.

It is not claimed that the figures given in the forthcoming report are necessarily and in all cases representative of American industry as a whole. It is realized that because of the relatively small number of establishments used in this study the various mobility rates shown must be regarded as being merely indicative of the general mobility situation at any given time. But whatever may be the limitations of the figures for the measurement of the amount of labor mobility at any particular time, they may be used with entire confidence in gauging the trend in mobility from season to season and from year to year.

Enormous as is the extent of establishment labor instability indicated by the figures presented, it is fair to assume (and this assumption is supported by a good deal of fragmentary evidence) that the actual situation is even worse. The establishments from which the Bureau of Labor Statistics has secured labor mobility figures have necessarily been the concerns which had the figures to give, that is to say, concerns which had given rather more attention than most firms to their force-maintenance problems. The firms reporting are chiefly concerns which had more or less centralized employment systems and were relatively more successful in the maintenance of a stable work force. In such establishments the instability situation is not likely to be as serious as in the general run of American industrial concerns, which as a rule pay little or no attention to the flow of labor in and out and give little thought to its control.

General Extent of Labor Mobility.⁶

THE enormous proportions that labor mobility may take on will be appreciated from an examination of Table 2 where the combined figures for the years 1910 to 1919 show that, in the estab-

⁶ Because of the limited space available only the more important and more general aspects of the subject are considered in this article. Certain phases of the labor mobility problem not touched upon in this article will be dealt with in the forthcoming bulletin; also, some further consideration will be given to points discussed here only in a very general way. Detailed figures will be presented to show the relative extent of labor mobility in different cities in the United States, the proportions of "necessary" and "unnecessary" mobility and the extent of absenteeism and its relation to labor mobility. There are also included detailed descriptive accounts of the employment methods and personnel activities of a number of the establishments which have been especially successful in dealing with the labor mobility problem.

lishments reporting, the accomplishment of 6,353,046,000 hours of work, which is labor time equivalent to that of 2,117,682 full-year (3,000-hour) workers, entailed 2,564,037 accessions and 2,481,280 separations, or a total of 5,045,317 labor changes. In other words, on the average for each year of the decade, 256,404 accessions, 248,128 separations, or a total of 504,532 labor changes were involved in the maintenance and the necessary enlargement or curtailment of a labor force of 211,768 workers. This means that the maintenance and the necessary expansion or curtailment of the requisite work force involved labor changes considerably more than equivalent to a complete annual overturn of the work force. This is as if during one year all the employees had left their jobs and a complete new set of workpeople had taken their places. It appears, then, that each year on the average the number of persons who quit, who were laid off or were discharged, as well as the number who had to be hired, was much larger than the total number of workers on the force at any one time.

TABLE 2.—LABOR MOBILITY 1910 TO 1919.

¹ The figures in column headed "Number of workers" in this and following tables in this article are obtained by dividing the total labor hours by 3,000. These figures are given simply to indicate the approximate size of the work force in order to make it possible directly to compare the absolute number of labor changes with the number of employees in the work force.

² The figures given for "1913-14" and "1917-18" are from establishments reporting in great detail during the two field investigations of this subject made by the Bureau of Labor Statistics in 1914 and 1918. The time covered by the statistical data from these establishments is a 12-month period ending, usually, about the middle of 1914 and 1918, respectively. This applies to the material shown for these dates throughout this article.

³ Computed, as already explained, by dividing the labor-change numbers by the total number of labor hours and multiplying by 10,000.

An examination of the rate figures of Table 2 (bearing in mind the fact that a flux rate of 6.6 represents a complete overturn of force) will show that in 6 of the 10 calendar years represented the number of labor changes in the plants reporting has been more than equivalent to a complete overturn of the work force; that is, there were at least as many accessions and at least as many separations as there were workers on the force. Even in 1915, the most stable year of the decade, there were 122,211 accessions and 99,734 separations entailed in the maintenance and enlargement of a work force of 159,054 employees. This is equivalent to a complete overturn of nearly 75 per cent of the work force during the year. In 1917-18, the most unstable of the periods shown, 631,173 accessions and 613,467 separations, or a total of 1,244,640 labor changes, were involved in the maintenance and enlargement of a work force of 305,901 workers. This is equivalent to more than two complete overturns of the work force during the year.

On the basis of the unit full-year (3,000-hour) worker the situation in the decade reported may be described as follows: Throughout the 10-year period, for every equivalent 3,000-hour worker in the aggregate work force, there were on the average more than two labor changes per year. In 1915, the period of least instability, there were about one and a half labor changes for each full-year worker. In the war period, 1917-18, there were more than four labor changes for each full-year worker in the aggregate work force. This is as if during these 12 months all the employees had left their jobs, an entirely new set had come in to fill their places, and afterwards all the employees in this second set had left their jobs and had in turn been fully replaced by a third set of workers.

There is also to be observed in Table 2 a very definite tendency of the mobility rates to vary with the prevailing industrial situation. This is indicated by relatively high mobility rates for the years 1913 and 1917-18, years of great industrial activity, and by a recession in the rates in years in which the industrial situation has been less favorable. It is quite probable that the labor mobility for the year 1919 is actually higher than is indicated by the figures shown here, since the number of establishments upon which the rates are based is rather small and includes several establishments with unusually low labor-mobility records.

The replacement or "turnover" numbers and rates in Table 2 are indicated by boldfaced type. Thus in 1910 persons were being hired at a rate of 3.5 and employees were leaving at a rate of 3.4 per 10,000 labor hours. The aggregate standard work force was obviously undergoing expansion and all separating employees were more or less promptly replaced. The separation rate, therefore, is to be taken as the replacement or "turnover" rate. In 1914 the situation was very different. Most industrial plants were curtailing operations. The result was an accession rate of 2.7 and a separation rate of 2.9. In these circumstances it is obvious that not all the separating employees were replaced—even tardily—and that consequently the accession rate is to be taken as the replacement rate. In 1914, obviously, not all of the 326,755 separating employees contributed to the turnover, as that word is here defined. There were only 300,121 persons hired during that year. This number, therefore, measures

the turnover, because this is the number of abandoned jobs in which there were replacements. The excess of separations over accessions, amounting in 1914 to 26,634, involves a phase of labor mobility not included in turnover. This excess shows the extent to which the standard work force was diminished during 1914 and in relation to the labor hours is, as already explained, the labor decrease rate, the corresponding excess of accessions in such a year as 1918 being the labor increase rate. In general throughout the 10-year period the accessions and separations have naturally tended to balance each other pretty closely, although they show slight variations reflecting the changing industrial conditions from year to year. Over the whole decade it is to be noted that the accessions appreciably exceed the separations, indicating a net increase in the gainfully employed population and just about such a normal industrial expansion as would naturally be expected.

In Table 3 the mobility figures for the two periods, 1913-14 and 1917-18, are classified by industry groups and the same data are presented in graphic form in Chart A.

Both Table 3 and Chart A show clearly the general increase of mobility rates over those of the prewar period and throw interesting side lights upon the influence of the war upon certain industries. Of the industry groups here represented, those which were most immediately affected by the necessity for articles of war are: Automobiles and parts, chemical industries, leather and rubber goods, machinery manufacturing, miscellaneous metal products, and slaughtering and meat packing. All of these groups, with one exception, show a decided increase in mobility rates over those of the prewar period. The rates of the slaughtering and meat-packing group show a slight decrease. This is not surprising in view of the fact that the mobility rate for this group in 1913-14 was already more than twice as great as the rate for all groups combined.

To undertake to show some definite relationship between the size of the establishment and labor mobility, detailed figures regarding the labor changes were so arranged as to show the mobility rates of establishments with less than 1,000 employees, of those having 1,000 and under 5,000, and of those with over 5,000 employees. In 1913-14 the flux rates for the different sizes of establishment in the order given above were 9.7, 5.9, and 6.2, respectively. The 1917-18 figures show flux rates of 17.3, 14.3, and 11.5, respectively. These figures in the main indicate a downward trend in mobility rates as the size of the establishment increases. It has not been possible to ascertain the exact reason for the relatively lower rates in the larger establishments, though it is conceivable that among the factors influencing the stability was the possibility of the larger establishments offering steadier work, relatively higher earnings, and better employment conditions generally. Lower rates might also indicate the efficiency of the employment department and the influence of the service and welfare activities which are generally carried on more extensively by the larger establishments.

CHART A.—LABOR FLUX RATES IN SPECIFIED INDUSTRY GROUPS
IN 1913-14 AND 1917-18.

Incidence of Labor Mobility in Special Groups within the Work Force.

ATTENTION should be called to the fact that labor mobility rates shown for a given year or for an industry group as a whole may fail to reveal the existence of very considerable variations in the amount of shifting within the divisions named and that further classification was necessary to reveal the real significance of the situation. This applies even more to the mobility of individual establishments for the reason that the shifting may be largely confined to a single occupation or a group of occupations, to the semi-skilled and unskilled employees, to employees of either sex, or to certain departments or shifts.

A study of the labor mobility in a large car-building establishment shows how greatly the mobility rates of the different occupation

groups vary from the rates for the whole establishment. For example, the flux rate of the total working force of this establishment is 18.0, while at the same time the rate for one occupation is zero and for another is 39.2. The figures of this establishment also show that although for the establishment as a whole there has been an excess of separations over accessions, this condition applies only to some of the occupation groups, while others show a number of accessions greater than the number of separations. The result is corresponding changes in the mobility rates.

The records of 22 of the establishments covered in the investigation of 1915 and 10 of those reported in the inquiry of 1918 were in such shape that it was possible to compare the stability records of skilled and unskilled workers. The figures are shown in Table 4.

TABLE 4.—LABOR MOBILITY OF SKILLED AND UNSKILLED WORKERS, 1913-1915 AND 1917-18.

[10 establishments reporting for 1913, 5 for 1914, and 7 for 1915; 10 establishments reporting for year ending May 31, 1918.]

Total.....	20,577	61,731,000	41,580	44,033	85,613
Rate per 10,000 labor hours.					
1913-1915.					
Skilled.....			2.0	2.2	4.2
Unskilled.....			4.3	4.7	9.0
Total.....			2.9	3.2	6.1
1917-18.					
Skilled.....			4.5	5.1	9.6
Unskilled.....			14.9	14.5	29.4
Total.....			6.7	7.1	13.8

The labor mobility rates for the two classes of labor show that in both periods unskilled labor was much more unstable than skilled labor. Moreover, this excess of instability on the part of the unskilled was much greater in the war period than in the prewar period. In the earlier period the mobility rates of the unskilled were more than double the rates for the skilled. In 1917-18 the mobility rates of the unskilled were three times as great as those of the skilled. In the earlier period there was, among the skilled, slightly more than 1 labor change for each skilled member of the working forces of the 22 plants and nearly 3 changes in unskilled jobs for each unskilled worker.

In 1917-18 there were nearly 3 skilled-labor changes for each skilled worker and about 9 unskilled-labor changes for each unskilled worker.

On the basis of figures secured from a machine-tool manufacturing plant the responsibility of the day and night forces, respectively, for the varying mobility rates is established. Over the 4-year period, 1916-1919, the flux rate per 10,000 labor hours for the day force was 7.5, that of the night force 20.9, and that of the day and night forces combined 10.1. The mobility of the night force is nearly three times as great as that of the day force and the former is, therefore, responsible for an extent of mobility entirely out of proportion to its numerical strength in the organization. Over the 4-year period the night force constituted about 20 per cent of the total working force but is chargeable with 45 per cent of the total number of labor changes. The greater shifting among the night workers thus causes the flux rate for the establishment as a whole to be 35 per cent higher than it would be if the labor changes in the night force were as infrequent, relatively, as those in the day force.

A special study of the relative labor mobility among males and females in the working forces of 45 establishments for the period 1917-18 resulted in the following mobility rates: Males, accession rate 5.6, separation rate 6, flux rate 11.6; females, accession rate 4.1, separation rate 3.7, flux rate 7.8. Although the rates for females are actually lower than those for males this can not be said to offer conclusive evidence that the shifting is generally less extensive among women, since the comparison of the mobility between males and females is not made invariably between employees in the same occupation and doing similar work. This is especially noticeable in industry groups in which the female labor force constitutes only a small fraction of the total working force and is composed almost entirely of clerical employees.

Analysis of Accessions.

IN CONNECTION with the subject of the general extent of labor mobility brief reference should be made to some particular phases of the mobility situation having to do with the accession of employees. One of these is the proportion of rehiring among the total accessions and the other is the relation between the number of applicants and the number actually hired. The number of accessions as reported in this article does not indicate the number of different individuals hired, since the accessions represent the total number of hirings in a given period and include original hirings as well as subsequent rehiring. Figures on the extent of rehiring were obtained by examination of the service records of employees on the pay rolls of six establishments at the end of 1915. These figures show that the hiring of 44,166 individuals involved 61,225 hirings and rehiring (repeated transactions), with a resultant increase in the number of accession transactions of nearly 40 per cent. Of the 44,166 individual employees taken on, more than 76 per cent had been hired once only, 15 per cent had been hired twice, over 5 per cent had been hired 3 times, more than 2 per cent 4 times, and about 1½ per cent had been hired and rehired more than 5 times. Among the employees under observation here the highest number of hirings and rehiring was 11, involving, however, only 2 employees out of more than 44,000.

The figures concerning the number of applicants for jobs are based upon the records of 8 establishments which kept account of the number of applicants for a longer or shorter period between 1912 and 1919 and indicate that with an aggregate number of workers amounting to 122,973 there were 1,041,475 applicants, of which number 145,509, or 14 per cent, were actually hired; this means, in other words, that for each person hired for a job there were more than 7 persons applying for it.

Nature of Separations.

IN ATTEMPTING to get some idea of the relative responsibility of the various influences bearing upon the mobility of labor it is highly important to give special consideration to the three types of separations, namely, voluntary separations or quits, discharges, and lay-offs. In Table 5 are given the number, rate per 10,000 labor hours, and the percentage of employees—discharged, laid off, and leaving voluntarily. Figures are shown for each year from 1910 to 1915, inclusive, and for the 12-month period ending May 31, 1918.

TABLE 5.—TYPE OF SEPARATION (DISCHARGE, LAY-OFF, OR VOLUNTARY QUITTING) OF EMPLOYEES LEAVING, BY YEARS FROM 1910 TO 1915, INCLUSIVE, AND FOR THE 12-MONTH PERIOD ENDING MAY 31, 1918.

Year.	Number of establishments.	Number of workers.	Total labor hours.	Accessions.	Separations.			
					Discharges.	Lay-offs.	Voluntary separations.	Total.

The arresting fact shown in the above rate and percentage distribution figures is that the great bulk of all separations to-day, as in 1910, is due to voluntary leaving. It also appears from these figures that periods of industrial prosperity are reflected in relatively low, and periods of depression in relatively high, proportions of lay-offs

to total separations, and that the lay-off rate is the most sensitive of the three separation rates to changing industrial conditions. Thus, in 1914, when the ratio of quits to total separations was lower than at any other time during the period covered by the figures, the proportion of lay-offs was higher than at any other time, constituting nearly one-third (31 per cent) of all separations, while in the immediately preceding year 1913 lay-offs made up only 7 per cent of all separations. The rate figures indicate that it is not alone the proportion, but also the actual rate of lay-off which is thus affected by business activity and depression, the lay-off rate for 1913 being 0.33, a relatively low figure, and for 1914, 0.84, an exceedingly high rate for lay-offs. The discharge rate is evidently subject to less extreme fluctuations than the lay-off rate, and it makes up from year to year a more constant proportion of the total separations. There appears, moreover, to be a rather definite relation between the accession and discharge rates, due, possibly, to the process of selection which goes on when new workers are taken on in large numbers. The consequence of the stimulating effect of business prosperity in boosting the voluntary leaving rates may be seen in the high rates of total separation in spite of the fact that the lay-off rates are relatively low. In periods of depression both the rates and the proportions of lay-off and discharge are larger than in periods of prosperity. This is due to the fact that when depression sets in there are unusually large numbers laid off, and employees are discharged more freely than would be the case when labor is urgently needed.

The degree of occupational training and skill possessed by the employee appears to make little or no difference in the proportion of quits, discharges, and lay-offs in the total separation rate. Returns from 22 establishments reporting mobility figures for skilled and unskilled employees separately indicate that 76 per cent of all skilled and 72 per cent of all unskilled employees who leave, quit voluntarily; 15 per cent of the skilled and 19 per cent of the unskilled were discharged, and that 10 per cent of the skilled and 9 per cent of the unskilled were laid off. The situation is quite different, however, with regard to the actual rate of separation, the figures indicating conclusively that the lay-off, discharge, and quitting rates, and of course the total separation rate, are each higher for unskilled than for skilled workers, the total separation rates being, as already stated, 2.2 for skilled and 4.7 for unskilled workers. The rate for each of the three types of separation shows about the same relation between skilled and unskilled, so that it would appear that skilled workers are about twice as stable as semiskilled and unskilled.

Seasonal Influences on Labor Mobility.

TABLE 6, showing the monthly trend in flux rates from January, 1910, to December, 1919, inclusive, brings out in greater detail the extent to which mobility figures immediately reflect the industrial conditions prevailing at the time.⁷

⁷ Based upon following numbers of establishments reporting monthly figures: 1910, 3; 1911, 6; 1912, 8; 1913, 39; 1914, 26; 1915, 30; 1916, 10; 1917, 20; 1918, 19; 1919, 9.

TABLE 6.—LABOR FLUX RATES, BY MONTHS, FROM JANUARY, 1910, TO DECEMBER, 1919, INCLUSIVE.

To obtain a composite picture of the seasonality of labor mobility over a relatively long period of time and to show more particularly the psychological effects upon the shifting of labor of the distinctive physical conditions characterizing the seasons, Table 7 has been constructed. The mobility figures have been brought together in this table in such a way as to combine the figures for identical quarterly periods for each of the years from 1910 to 1919, inclusive; it is believed that by such a combination of the figures most of the influences upon mobility which are of a purely industrial character are neutralized and the influence of the seasons more accurately reflected.

TABLE 7.—EXTENT OF LABOR MOBILITY IN THE FOUR SEASONS OF THE YEAR.

[Based on the monthly data of the four seasons for all years from 1910-1919, combined. Replacement (or "turnover") numbers and rates are printed in boldfaced type.]

Total.....			4.35	3.91	8.26

The figures in Table 7 and the labor flux rates given in Table 6, for each month of the years 1910 to 1919 combined, show a tendency to maximum labor mobility in the spring and a gradual lessening of mobility during the summer and early fall.

The flux figures of Table 6 and, in addition, the corresponding accession and separation rates are plotted on Chart B. Since replacement rates, as explained above, correspond with accession rates when the accession rates are lower than the separation rates and with separation rates when the separation rates are lower than accession rates, it follows that the lowest points on the chart mark the rate and trend of labor replacement. That is to say, whichever line happens to be the lowest marks replacement.

Length of Service as a Factor in Labor Mobility.

IN THE preceding discussion of labor mobility one very important factor, that of length of service, has not been touched upon. Monthly and yearly figures expressed in the form of accession, separation, and flux rates are valuable for the purpose of showing the general extent of mobility in the labor force as a whole and its trend during any given period of time. Such figures, however, do not throw much light on the degree of stability within the working force in so far as it relates to the length of service of the active as well as the separated employees; without such figures no correct idea can be formed of the relative extent of labor mobility.

The experience of 34 establishments in 1913-14 and 53 in 1917-18, which furnished comprehensive figures on the length of service of their active employees, as well as of those who left their employ, is summarized in Table 8.

TABLE 8.—LENGTH-OF-SERVICE DISTRIBUTION OF "ACTIVE EMPLOYEES" (THOSE ON PAY ROLL AT END OF YEAR) AND OF EMPLOYEES WHO LEFT DURING THE YEAR ("SEPARATING EMPLOYEES").

[Number of establishments reporting, 1913-14: 34; 1917-18: 53.]

CHART B.—FLUCTUATIONS IN LABOR MOBILITY, BY MONTHS, FROM JANUARY, 1910, TO DECEMBER, 1919, INCLUSIVE.

If we consider those employees having to their credit not more than one year of service as short-service employees, it will be noticed in this table that the proportion of such employees in the active work force is rather extensive. On the other hand, considerable proportions among the active employees had long-service records. The figures for those separated, however, present a striking contrast and undoubtedly reflect the influences of unusual industrial activity in both of the periods studied, but more especially the effect of war-time conditions upon labor mobility. In the period 1917-18, out of a total of 93,092 separated employees, over 40 per cent had on severing their connections served periods of one month or less, about 33 per cent had worked from one to six months, 10.5 per cent from six months to one year; a total of 84 per cent had to their credit continuous-service records of one year or less.

In both periods there was a considerable exodus of long-service employees; 18.8 per cent of all separating employees in 1913-14 and 16 per cent in 1917-18 were employees with service records of over one year. Nevertheless the census of the active employees taken at the end of the period shows large proportions of employees of long tenure. The figures for 1913-14 show 38.2 per cent with continuous-service records of from one to five years, and 32.9 per cent with service records of over five years; and the figures for 1917-18 show 32.6 per cent of all active employees with service records of from one to five years and 27.8 per cent with continuous-service records of over five years.

A count of the actual length of service of 439 separated employees in two establishments in the one-week-or-less group showed the number of employees having had specified days of service to be as follows: Less than one day of service, 21 employees; one day, 94 employees; 2 days, 57 employees; 3 days, 54 employees; 4 days, 48 employees; 5 days, 54 employees; 6 days, 111 employees. This shows that over 25 per cent worked one day or less, about 50 per cent worked from two to five days, and only a little over 25 per cent worked a full week.

A separate study of the relative proportions of active and separated employees in the different industry groups reveals considerable variation from the figures given above. Some of these groups show that as high a proportion as 30 per cent of all separated employees of the period 1917-18 had worked one week or less, while in other groups the proportion of the separated employees who had served three months or less was as high as from 60 to 80 per cent.

The relation between the degree of skill and the length of service of both active and separated employees was made the subject of a special inquiry reporting the experience of 17 establishments covering the years 1913, 1914, and 1915. Briefly, the figures indicate that only about one-tenth of the skilled employees on the pay roll, but nearly one-fourth of the unskilled had served as short a time as three months or less. The proportions of the skilled and unskilled active employees who had served from one to five years are about the same; in the over-five-years service group of active employees there is a considerable difference, however, the proportion of skilled in that group being 33.3 per cent, whereas the proportion of unskilled is only 16.6 per cent. Among the separated employees it is only in the long-service groups that there is any decided difference in the relative

proportions of skilled and unskilled employees. The unskilled separating employees show a slightly higher percentage in the length of service groups of one year or less, the figures being 81.7 per cent for skilled and 86.7 per cent for unskilled; in the over-one-to-five-year groups the proportion of skilled separated employees is 14.5 per cent, and that of the unskilled 11.6 per cent; in the over-five-year group the skilled represented 3.9 per cent and the unskilled 1.7 per cent of the total separations.

A study of the length-of-service figures of the active working force of 28 establishments for the period 1917-18, classified according to sex, shows the proportions of the sexes to be about equally divided in the lower length-of-service groups, the females having higher proportions in the service groups between six months and five years, while the males show a much greater proportion in the over-five-year group. A comparison of the length of service of the separated male and female employees for the year ending May 31, 1918, shows that larger proportions of separating male employees than of females are bunched in the short-service periods. Thus, 63 per cent of the total number of separating males as against 50 per cent of the females had served less than three months. In the six-months-to-one-year groups the proportions are about equally divided. In the long-time-service groups of separated employees the figures for males show that they are less prone to sever connections with an establishment after having worked in it a considerable period of time. Of all the separating females whose service records were reported, 18.7 per cent had served from one to five years, whereas only 11.3 per cent of all the separating males had served from one to five years. Finally, of the employees leaving after having served continuously more than five years, 3.6 per cent were males and 6 per cent were females.

Stable and Unstable Employees.

IN THE discussion of the figures on the length of service of the active working force attention has been called to the fact that in each establishment at a given time there will be found long-service employees who can not be said to have been a factor in the mobility in a period over which they have served continuously. This brings out the fact that there is more or less concentration in the mobility of the plant forces, and for that reason the rates of mobility as applied to the working force as a whole do not correctly assign the direct responsibility for the labor flux. It is evident that the rates of mobility will be the same if the whole working force changes completely once in the course of a year, or, if one-half of the working force changes two times, or, one-fourth of the working force changes four times in the course of a year, and so on. In the presentation of the figures that follow an attempt is made to show by means of length-of-service figures exactly what proportion of the work force is responsible for the labor mobility. The detailed figures on length of service given in Table 8 show that of the 71,769 persons on the pay rolls in 53 establishments on June 1, 1918, 43,321, or 60 per cent, had been in continuous service over one year. These long-service employees were in no way responsible for the labor mobility of these establishments for the 12-month period ending with that date. In

Table 9 the base upon which the rate of mobility is measured is that part of the working force which directly contributed to it.

TABLE 9.—COMPARISON OF LABOR MOBILITY RATES BASED ON THE TOTAL WORKING FORCE WITH THE RATES BASED ON THE UNSTABLE PART OF THE WORKING FORCE, YEAR ENDING MAY 31, 1918.

Number of establishments.	Total working force. ¹	Unstable part of working force.	Per cent that unstable part of working force is of total working force.	Labor hours worked by—		Labor changes.		
				Total working force.	Unstable part of working force.	Accessions.	Separations.	Total (flux).
53.....	69,553	26,232	38	208,659,000	78,696,000	93,206	96,207	189,413

Number of establishments.	Rate per 10,000 labor hours, based on total working force.			Rate per 10,000 labor hours, based on unstable working force.		
	Accessions. ²	Separations. ²	Flux. ²	Accessions. ²	Separations. ²	Flux. ²
53.....	4.5	4.6	9.1	11.8	12.2	24.0

¹ This number is 2,216 less than the number on the pay roll of the 53 establishments at the end of May, 1918, as shown in Table 8, the labor time of the employees with less than one year's continuous service having been reduced to equivalent full year or 3,000-hour workers.

² Represents ratio of labor changes (accessions, separations, and flux) to labor hours of total working force.

³ Represents ratio of labor changes (accessions, separations, and flux) to labor hours of unstable part of working force.

This table shows that in these 53 establishments with a working force of 69,553 there were at the end of the year 43,321 employees, or 62 per cent of the total number on the pay roll who had service record of over one year. Those employees were not responsible for any of the labor changes that took place during the year. The labor mobility in the 53 establishments was, therefore, concentrated upon 26,232 workers, or 38 per cent of the total working force. This relatively small part of the working force was responsible for all the labor changes which took place during the year, amounting to 93,206 accessions and 96,207 separations, a labor flux of 189,413 persons. This means that for every worker of the unstable working force more than 3 persons were hired and nearly 4 persons left employment, or that altogether there were more than 7 labor changes for each worker. A comparison of the labor mobility of the stable and unstable working force shows the labor mobility rates based on the labor hours of the unstable part of the work force to be nearly three times as great as the labor change rates based upon the labor hours of the whole working force.

Effect of Employment Policy on Labor Stability.

THE definite effectiveness of liberal labor policies and centralized systems of employment is demonstrated, in so far as it is possible to demonstrate such things in statistical terms, by the figures presented in Table 10. This table shows, by years, for the period from 1913 to 1919, inclusive, the mobility rates of 10 selected firms and of all other firms reporting. The 10 concerns were chosen not only because they had definite labor policies and centralized employment

machinery, but also on account of the fact that they had had considerable success in stabilizing their work forces and keeping their labor flux rates at relatively low levels.

TABLE 10.—COMPARISON OF LABOR MOBILITY IN 10 SELECTED ESTABLISHMENTS WITH ITS MOBILITY IN ALL OTHER ESTABLISHMENTS REPORTING FOR THE CALENDAR YEARS 1913 TO 1919, INCLUSIVE.

[Replacement (or "turnover") rates are printed in boldfaced type.]

Year.	Labor change rates per 10,000 labor hours.					
	10 selected establishments.			All other establishments reporting.		
	Accession.	Separation.	Flux.	Accession.	Separation.	Flux.
1913.....	5.4	5.5	10.9	4.4	4.3	8.7
1914.....	1.1	1.5	2.6	2.8	3.1	5.9
1915.....	1.6	.8	2.4	3.0	2.6	5.6
1916.....	2.6	1.4	4.0	6.2	4.5	10.7
1917.....	1.7	1.9	3.6	5.8	5.7	11.5
1918.....	3.4	2.7	6.1	7.4	6.2	13.6
1919.....	3.2	2.4	5.6	3.6	3.4	7.0
Total.....	2.8	2.3	5.1	3.8	3.7	7.5

This table shows in very striking fashion that the 10 selected concerns have brought about a considerable reduction in the extent of their labor flux and have suffered a much slighter decrease in stability during the war period than did the general run of establishments.

This comparison of achievements shows the vital importance from the standpoint of the industrial establishment, of studying this subject of labor mobility, the necessity of observing the employment and personnel methods currently practiced by the more far-sighted employers, the desirability of keeping systematic and continuous employment records in order to measure the effects of different methods and policies upon labor stability, and the imperative need for the more widespread adoption by employers generally of such labor and employment policies as will be most effective in eliminating from our industrial life the evil and the waste of excessive labor mobility.

PRICES AND COST OF LIVING.

Retail Prices of Food in the United States.

THE following tables are based on figures which have been received by the Bureau of Labor Statistics from retail dealers through monthly reports of actual selling prices.¹

Table 1 shows for the United States retail prices of food on March 15 and April 15, 1920, and on April 15, 1919, as well as the percentage changes in the month and in the year. For example, the price of a pound of potatoes in April, 1919, was 3.1 cents; in March, 1920, 6.8 cents; and in April, 1920, 9.1 cents. These figures show an increase of 34 per cent in the month and an increase of 194 per cent in the year. The cost of 22 articles combined² increased 5 per cent in the month and 16 per cent in the year.

TABLE 1.—AVERAGE RETAIL PRICES OF SPECIFIED FOOD ARTICLES AND PER CENT OF INCREASE OR DECREASE, APR. 15, 1920, COMPARED WITH APR. 15, 1919, AND MARCH 15, 1920.

[Percentage changes of five-tenths of 1 per cent and over are given in whole numbers.]

¹ In addition to retail prices of food, the Bureau secures prices of coal, gas, and dry goods from each of 51 cities, and publishes these prices as follows: Coal, in the March and September issues of the MONTHLY LABOR REVIEW; gas, in the June issue; dry goods, in the April, July, October, and December issues.

² The following are the 22 articles, weighted according to the consumption of the average family: Sirloin steak, round steak, rib roast, chuck roast, plate beef, pork chops, bacon, ham, lard, hens, flour, corn meal, eggs, butter, milk, bread, potatoes, sugar, cheese, rice, coffee, tea. These include all articles for which prices have been secured each month since 1913 with the exception of lamb, for which the Bureau has no consumption figures.

¹ See note 2, p. 57.

Table 2 shows for the United States average retail prices of specified food articles on April 15 of each year, 1913 to 1920, together with the percentage change in April of each year compared with April, 1913. For example, as compared with the price in April, 1913, potatoes showed an increase of 20 per cent in 1914. In April, 1915, the price was the same as in April, 1913. As compared with April, 1913, the price in April, 1916, showed an increase of 53 per cent; in April, 1917, an increase of 287 per cent; in April, 1918, an increase of 47 per cent; in April, 1919, an increase of 107 per cent; and in April, 1920, an increase of 507 per cent. This means that the retail price of potatoes in April, 1920, was a little over 6 times as much as it was in April, 1913.

The cost of 22 articles, combined, increased 115 per cent during the seven-year period.

TABLE 2.—AVERAGE RETAIL PRICES OF SPECIFIED FOOD ARTICLES AND PER CENT OF INCREASE OR DECREASE APR. 15 OF EACH YEAR, 1914 TO 1920, COMPARED WITH APR. 15, 1913.

[Percentage changes of five-tenths of 1 per cent and over are given in whole numbers.]

Relative Retail Prices of 22 Articles of Food.

IN TABLE 3 the average monthly and yearly prices of 22 food articles³ are shown as relative prices or percentages of the average prices for the year 1913. These relatives are computed by dividing the average price of each commodity for each month and each year by the average price of that commodity for 1913. Relative prices must be used with caution. For example, the relative price of pork chops in November, 1919, was 200, which means that the money price was 200 per cent of the money price in 1913, or, in other words, the price doubled. The relative price of pork chops in December was 181, showing a drop of 19 points from 200, which is a decrease of only 9.5 per cent.

In the last column of this table are given index numbers⁴ showing the changes by months and years in the retail cost of the 22 food articles weighted according to the importance of each article in the consumption of the average family. Prices are obtained each month for 43 food articles, but only 22 of these are included in the retail food price index because the amounts consumed by the average family have been obtained as yet for only these 22 food articles. These articles comprise about two-thirds of the entire food budget of the average family and reflect with great accuracy changes in the cost of the food budget. The figure representing the cost of these 22 food articles was 200 in March and 211 in April. This shows that, as compared with 1913, the cost of these food articles was in April, 1920, more than double what it was in 1913, and that during the month from March to April there was an increase of 5 per cent in the cost of these articles.

The curve shown in the chart on page 64 pictures more readily to the eye the changes in the cost of the family market basket and the trend in the cost of the food budget than do the index numbers given in the table. The chart has been drawn on the logarithmic scale⁵ because the percentages of increase or decrease are more accurately shown than on the arithmetic scale.

³ For list of articles, see note 2, p. 57.

⁴ For a discussion of the method used in the computation of these index figures, see MONTHLY LABOR REVIEW for March, 1920, p. 34.

⁵ For a discussion of the logarithmic chart, see article on "Comparison of arithmetic and ratio charts" by Lucian W. Chaney, MONTHLY LABOR REVIEW for March, 1919, pp. 20-34. Also, "The 'ratio' chart," by Prof. Irving Fisher, reprinted from Quarterly Publications of the American Statistical Association, June, 1917, 24 pp.

1 No hens sold in this month by order of Food Administration.

TREND IN RETAIL COST OF 22 FOOD ARTICLES, COMBINED, FOR THE UNITED STATES, BY MONTHS, JANUARY, 1913, TO APRIL, 1920.

[Average cost for 1913=100.]

Comparison of Retail Food Costs in 51 Cities.

TABLE 4 shows for 39 cities the percentage of increase or decrease in the retail cost of 22 food articles⁶ in April, 1920, compared with the average cost in the year 1913, in April, 1919, and in March, 1920. For 11 other cities comparisons are given for the one-year and one-month periods. These cities have been scheduled by the Bureau at different dates since 1913. For Savannah, Ga., the comparison is given only for the month, as this city was first scheduled by the Bureau in 1920. These percentage changes are based on actual retail prices secured each month from retail dealers and on the average family consumption of these articles in each city.⁷

TABLE 4.—PERCENTAGE CHANGES IN THE RETAIL COST OF 22 FOOD ARTICLES IN APRIL, 1920, COMPARED WITH THE COST IN MARCH, 1920, APRIL, 1919, AND WITH THE AVERAGE COST IN THE YEAR 1913, BY CITIES.

Retail Prices of Gas in the United States.¹

THE following table shows for 51 cities the net price, per 1,000 cubic feet, of gas used for household purposes. Prices are, in most cases, for manufactured gas, but prices for natural gas have also been quoted for those cities where it is in general use. For Los Angeles, prices are given for natural and manufactured gas, mixed. The prices shown do not include any extra charge for service.

⁶ For list of articles see note 2, p. 57.

⁷ The consumption figure used for each article in each city is given in the MONTHLY LABOR REVIEW of November, 1918, pp. 94 and 95.

¹ Retail prices of gas are secured annually and are published in the June issues of the MONTHLY LABOR REVIEW.

MONTHLY LABOR REVIEW.

NET PRICE, PER 1,000 CUBIC FEET, OF GAS FOR HOUSEHOLD USE ON APR. 15 OF EACH YEAR, 1913 TO 1920, BY CITIES.

Manufactured gas.

---------------------	--	--	--------	--------	--------	--------	--------	--------

¹ Sale of manufactured gas discontinued.

From the prices quoted on manufactured gas in 43 cities, average prices have been computed for the 43 cities combined and are shown for April 15 of each year from 1913 to 1920 in the next table. Relative prices have been computed by dividing the price in April of each year by the price in April, 1913.

As may be seen in the table, the price of manufactured gas has changed but little since 1913, being only 15 per cent higher in April, 1920, than in April, 1913, and until 1918 being less than in 1913.

AVERAGE¹ AND RELATIVE PRICES OF MANUFACTURED GAS FOR HOUSEHOLD USE, PER 1,000 CUBIC FEET, ON APR. 15 OF EACH YEAR, 1913 TO 1920, FOR 43 CITIES COMBINED.

[Average price in April, 1913=100.]

¹ Net price.

Index Numbers of Wholesale Prices in the United States.

LARGE increases again took place in the wholesale prices of many important commodities during the month of April, according to information collected in representative markets by the United States Bureau of Labor Statistics. The Bureau's weighted index number, which registered 253 in March, rose to 265 in April. This represents an advance of nearly $4\frac{3}{4}$ per cent.

The most notable examples of price increase were found in the group of fuel and lighting materials, the increase in this group as a whole being 11 per cent. Bituminous coal and coke were responsible in large measure for the results shown. Food followed next with an increase of $9\frac{3}{4}$ per cent, due largely to the recent sharp advance in sugar and potatoes. In the group of lumber and building materials prices continued steeply upward, with an increase of $5\frac{1}{4}$ per cent over March. The groups of farm products and chemicals each showed an increase of over 3 per cent, while smaller increases were recorded for metals and metal products and for house-furnishing goods.

An increase of nearly $3\frac{1}{2}$ per cent in April prices over those of March was found in the group of miscellaneous commodities, including such important articles as bran, mill-feed middlings, lubricating oil, newsprint and wrapping paper, and wood pulp. In only one group, that of cloths and clothing, was there a net decrease in prices from March to April. This decrease, which amounted to less than 1 per cent for the group, was due entirely to the decline in raw silk and leather.

The following table shows the more important price changes occurring between March and April, as measured by average prices for each month:

IMPORTANT ARTICLES INCREASING OR DECREASING IN AVERAGE PRICE IN APRIL,
AS COMPARED WITH MARCH, 1920, BY GROUPS OF COMMODITIES.

Measured by changes in the index numbers for the 12 months from April, 1919, to April, 1920, farm products increased 4.7 per cent in price, food 28 per cent, and cloths and clothing 62.7 per cent. During the same time fuel and lighting increased 27½ per cent, metals and metal products over 28 per cent, and lumber and building materials 110½ per cent in price. Chemicals and drugs increased 19 per cent, house-furnishing goods 52½ per cent, and miscellaneous commodities over 10 per cent in average price. All commodities, considered in the aggregate, increased 30½ per cent in price.

¹ Preliminary.

Price Changes, Wholesale and Retail, of Important Food Articles in Selected Cities.

CONTINUING information published in previous issues of the MONTHLY LABOR REVIEW, the trend of wholesale and retail prices since 1913 for a number of important food products is shown herewith. Exact comparison of wholesale with retail prices is not attempted in the tables. Some food products—fresh meats, for example—are not sold by the retailer in the same form in which they leave the wholesaler, hence strictly comparable prices are not obtainable. It was found impracticable also to obtain both wholesale and retail prices for the same date, the retail prices being those prevailing on the 15th of the month, while the wholesale prices are for a variable date, usually several days prior to the 15th. The figures in the table are therefore to be considered as merely indicative of price variations in the retail as compared with the wholesale markets.

To assist in comparing the fluctuations at wholesale and at retail, the differential between the two series of quotations at successive dates is given. It should not be assumed, however, that this differential in any case represents the margin of profit to the retailer, since, in addition to a possible difference of grade between the articles shown at wholesale and retail, the various items of handling cost to both the wholesaler and retailer are included in the figure.

WHOLESALE AND RETAIL PRICES OF IMPORTANT FOOD ARTICLES IN SELECTED CITIES.

[The initials W=wholesale, R=retail. The wholesale price is the mean of the high and low quotation on the date selected, as published in leading trade journals. The retail price is the average of prices reported to the Bureau of Labor Statistics by dealers.]

Wholesale Prices in the United States and Foreign Countries, 1913 to March, 1920.

IN THE following table the more important index numbers of wholesale prices in the United States and several foreign countries, as compiled by recognized authorities, have been reduced to a common base in order that the trend of prices in the several countries may be directly compared. The results here shown have been obtained by merely shifting the base for each series of index numbers to the year 1913; i. e., by dividing the index for 1913 on the original base into the index for each year or month on that base. These results are therefore to be regarded only as approximations of the correct index numbers in the case of series constructed by averaging the relative prices of individual commodities.¹ This applies to the index numbers of the Department of Labor of Canada and the *Statistique Générale* of France. The index numbers of the United States Bureau of Labor Statistics, the British Board of Trade, and the Bureau of Census and Statistics of Australia are built on aggregates of actual money prices, or relatives made from such aggregates of actual prices, and therefore can readily be shifted to any desired base. The validity of the comparison is also affected by the wide difference in the number of commodities included.

¹ For a discussion of index numbers constructed according to this method, see Bulletin No. 181 of the Bureau of Labor Statistics, pp. 245-252.

WHOLESALE PRICES IN THE UNITED STATES AND CERTAIN FOREIGN COUNTRIES.

[Index numbers expressed as percentages of the index number for 1913. See text explanation.]

Year and month.	United States: Bureau of Labor Statistics; 328 commodities (variable).	Canada: Department of Labor; 272 commodities (variable).	United Kingdom: Board of Trade; 47 commodities.	France: Statistique Générale; 45 commodities.	Sweden: Svensk Handelstidning; number of commodities not stated.	Australia: Bureau of Census and Statistics; 92 commodities.

Retail Price Changes in Great Britain.

THE following table gives for Great Britain the increase over July, 1914, in the cost of food and general family expenditure for May of each year, 1915 to 1920, and for each month in 1920. The food items included in this report are: Ribs and thin flank of beef, both British and chilled or frozen; legs and breast of mutton, British and chilled or frozen; bacon; fish; flour; bread; tea; sugar; milk; butter, fresh and salt; cheese; margarine; eggs; and potatoes.

The table gives percentage of increase, and is not one of relative prices, as is the table given for the United States. When making comparisons this should be borne in mind, and to obtain the relative prices it is necessary to add 100 to the percentage as given, e. g., for January, 1920, the increase in cost of food is 136 per cent, the relative price being 236.

The figures represent two comparisons: First, the increase in prices, based on the same kinds and quantities as used in July, 1914; second, the increase, based on the change in the standard of living, resulting from a substitution of one kind of food for another to meet war-time conditions.

The table shows that retail prices of food were 146 per cent higher in May, 1920, than in July, 1914, and that the increased cost of all items in the family budget was 141 per cent.

PER CENT INCREASE IN COST OF FOOD AND ALL ITEMS IN FAMILY BUDGET IN GREAT BRITAIN BASED ON JULY, 1914.

• [Compiled from the British Labor Gazette.]

Year and month.	Food.		All items in family budget.	
	Retail prices (assuming same kinds and quantities).	Expenditures (allowing for estimated changes in consumption).	Cost (assuming same kinds and quantities).	Expenditures (allowing for estimated changes in consumption).

¹ Including tax on sugar and tea.

² Not including taxes.

³ Based on change in standard of food consumption adopted by the Ministry of Food.

⁴ The increase, excluding additional taxation, is 7 per cent less.

⁶ No longer calculable, mainly owing to decontrol.

Cost of Living in Argentina in 1913, 1917, and 1919.

FIGURES on the cost of living in Argentina are presented in Commerce Reports (Washington) for April 8, 1920, in an article which gives the following table of advances in prices of some of the staple foodstuffs, per kilo, since 1913. The conversions into United States money have been made on the basis of 1 paper peso equals 43 cents.

PRICES OF CERTAIN FOODSTUFFS PER KILO (2.2 POUNDS) IN ARGENTINA IN 1917 AND 1919 COMPARED WITH 1913.

With respect to rents the report makes the following comment:

With land values as high as \$85 (United States currency) per square foot in the central parts of Buenos Aires and single-story houses the prevailing type, rents are necessarily high. A five-room flat, exclusive of kitchen, suitable for the average mechanic, rents for \$60 per month, or actually more than his month's wages. Consequently several large families often occupy a single house, and even so there are cases of eviction because of inability to pay rent.

It is the custom to place the address of a house to be rented with a rent agent, who charges a fee of 10 pesos [\$1.30] to the prospective tenant before he gives the address of the vacant apartment. This means that a person looking for a flat often spends 50 or 60 pesos [\$21.50 to \$25.80] for information before suitable accommodations are found. The rents for four or five room apartments of the better class, usually without lighting fixtures or plumbing attachments, vary from \$125 to \$160 per month. These accommodations are considered suitable for what corresponds to the middle class in the United States.

The daily wages of workmen vary from 3 to 7 paper pesos (\$1.29 to \$3.01, par), according to the report. Gardeners and common laborers receive 3 to 4 pesos (\$1.29 to \$1.72, par) per day, carpenters and other mechanics usually 6 to 7 paper pesos (\$2.58 to \$3.01, par) per day, railway laborers 60 to 80 pesos (\$25.80 to \$34.30, par) per month, and street-car motormen and conductors in Buenos Aires recently established a minimum rate of 4.50 pesos (\$1.93½, par) per day. The report suggests that "at the present high price of food and rent the average laborer finds his wages unequal to the task of providing the necessities for his family."

WAGES AND HOURS OF LABOR.

Wages and Hours in Automobile, Car, Electrical Apparatus, Foundry, Machinery, Machine Tool, and Typewriter Industries.

IN THE following tables is presented a summary report on the industries included in the Industrial Survey of 1919 not covered by reports appearing in earlier numbers of the Monthly Labor Review. The industries included in this report are as follows: The manufacture of automobiles, cars, electrical apparatus, the foundry industry, the manufacture of machinery, machine tools, and typewriters. These industries have a common feature in the fact that they are all engaged in working up iron and steel into the form of finished products.

The limitations put upon the survey in the different industries are as follows: The automobile industry includes the manufacture of both pleasure cars and commercial cars. Of the 32 establishments covered in the investigation of the automobile industry, 13 manufactured only pleasure cars, 14 only commercial cars, while 5 manufactured both pleasure and commercial cars.

The investigation of the car industry was confined to establishments manufacturing freight cars on a commercial basis.

Under the heading electrical apparatus is included information concerning the manufacture of such electrical machinery as generators, motors, and transformers and such apparatus and supplies as telephone equipment, circuit breakers, rheostats, and wiring devices.

The foundries from which data were obtained were for the most part connected with establishments using their own castings. Automobiles were the final product of 1 of these establishments, electrical apparatus of 2, typewriters of 2, machine tools of 5, cars of 6, and machinery of 134.

Two classes of machine-shop establishments were included in the survey, those engaged in the manufacture of machine tools and those engaged in the manufacture of other forms of machinery. All establishments of the latter class are grouped under the heading "Machinery." The machines turned out by these establishments were such heavy products as stationary engines, mining machinery, ice-making machines, printing presses, sugar-mill machinery, and textile machinery. The machine-tool industry is so clearly defined that no explanation of the scope of the investigation is necessary.

For lack of a general term to describe the variety of products included under the heading "Typewriters," the name of the most important single one of those products has been applied to the group as a whole. In addition to the manufacture of typewriters is included the manufacture of adding machines, computing machines, and cash registers.

Table 1 shows the States included in the survey of the several industries covered by this article and the number of establishments and employees listed in each State.

The speed with which it was necessary to carry out the survey made it impossible to obtain the records of all the establishments in an industry for the same pay roll period. As conditions were changing rapidly during the progress of the survey, the exact date of the material presented is of more importance than it would be in a normal year. The pay rolls in each industry were distributed by months, as shown in the following table:

TABLE 2.—NUMBER OF PAY-ROLL PERIODS IN SPECIFIED MONTHS.

Industry.	Total number of pay-roll periods.	Number of pay-roll periods in—								
		1918				1919				
		Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.

Machinery.....	121		1	2	7	26	23	28	25	9
Machine tool.....	29	3	22	4						
Typewriter.....	28					12	5	3	5	3

It will be seen that all the establishments included in the machine-tool industry fell in the months of September, October, and November, 1918, while the other industries were wholly, or in large part, confined to the early months of 1919. In the electrical-apparatus industry 1 schedule out of 38 fell in 1918; in the foundry industry, 15 out of 150; in the machinery industry, 10 out of 121. At the other extreme a comparatively small number of establishments fell as late as May, 1919, viz, 3 in the car industry, 2 in the electrical-apparatus industry, 11 in the foundry industry, 9 in the machinery industry, 3 in the typewriter industry. The material is presented as of the year 1919. So far as could be ascertained, no changes in rates of pay occurred in any of the industries during the progress of the survey.

Every effort was made to confine the survey to establishments working full time during the selected pay-roll period. In a few cases, however, it was found to be impossible to secure adequate representation of different localities without including one or more establishments working only part time. As part-time work necessarily results in abnormally low figures for hours worked and earnings received during the pay-roll period, the number of such establishments is hereby indicated. In the manufacture of electrical apparatus 1 part-time establishment was included in Massachusetts. In the foundry industry 12 were included, distributed as follows: 1 in Delaware, 1 in Iowa, 1 in Maine, 1 in Massachusetts, 2 in New Hampshire, 3 in New York, 1 in Pennsylvania, 1 in Rhode Island, and 1 in Vermont. In the machinery industry 1 part-time pay roll was included in each of the following States: Indiana, Iowa, Maryland, New Hampshire, and New York. In the typewriter industry 2 part-time pay rolls, both for establishments located in Pennsylvania, were included. In comparing hours and earnings of employees in these industries, due weight should be given to the effect of the part-time pay rolls upon the averages for the States and industries in which they were found.

The information concerning hours and earnings on which the tables are based was obtained directly from the pay rolls or other records of the companies by agents of the Bureau. Other information was obtained from responsible officials in personal interviews. Whenever the records of the company failed to indicate the time actually worked by pieceworkers during the selected pay-roll period, arrangements were made to have such a record kept for a future period. In all cases the figures copied by the agents represented the hours actually worked and earnings actually received.

As the material comes in to the office the figures for hours and those for earnings are both in incommensurable form on account of inequalities in the length of pay-roll periods and in the time worked by different individual employees. Before they can be presented in tabular form it is necessary to reduce both hours and earnings to a common denominator. The comparable figures selected for use in the following tables are hours worked per day and earnings per hour. These figures are obtained in the following manner:

The hours per day of each employee are obtained by dividing the number of hours worked by him during the pay-roll period by the number of week days, holidays omitted, in the pay-roll period. Thus in the case of pay rolls for a single week containing no holidays, the hours worked by each employee during the pay-roll period are divided

by six, whether the employee worked on each of the six days or not. Similarly the hours actually worked by an employee in any establishment during a pay-roll period containing 13 workdays were divided by 13, regardless of the number of days on which the employee worked. The resulting figure represents the number of hours per day that the employee would have worked if his time had been distributed uniformly among the week days of the pay-roll period.

The earnings of each employee are reduced to the form of average earnings per hour by dividing his total earnings for the pay-roll period by the total hours worked by him during the pay-roll period. The resulting figure indicates how much he would have earned per hour if his earnings had been distributed uniformly over all the hours actually worked by him during the period. The sum of these individual hourly earnings, divided by the number of employees in the group, equals the average hourly earnings for the group.

All one-week pay rolls included in the survey of these industries were six-day pay rolls. The half monthly and monthly periods, however, showed considerable differences in length. The following table shows for each industry the number of schedules covering each specified number of workdays.

TABLE 3.—SCHEDULE DISTRIBUTION BY NUMBER OF WORK DAYS IN THE PAY-ROLL PERIOD.

Industry.	Total number of schedules.	One week or 6 work days.	Two weeks, one-half month, or—					One month, or—		
			10 work days.	11 work days.	12 work days.	13 work days.	14 work days.	22 work days.	24 work days.	27 work days.

The significance of the figures in the different columns of Table 4, which follows, the method by which they were obtained and the limitations under which they should be used have been explained in detail in previous articles in the MONTHLY LABOR REVIEW dealing with the results of the survey.¹ The various figures in the present article have been computed by the same method as those in the earlier articles.

In a considerable number of instances in Table 4 employees in more than one occupation have been grouped together. This has been done largely on account of the limitations of space necessarily imposed upon an article of this kind. It has usually been done, however, only in cases where both the average hours and earnings and the distribution of employees by hours and earnings have been so nearly alike that the resulting figures could be used with equal confidence as showing the conditions in any one of the separate occupations.

¹ See especially MONTHLY LABOR REVIEW for January, 1920, pp. 120 to 124, and May 1920, pp. 96-100.

An exception should be noted in the case of employees working directly upon metal-working machinery. These employees are variously known as machinists, machine hands, and machine operators. In a general way, these terms indicate varying degrees of knowledge and skill possessed by the employees properly grouped under them. In practice, however, such lack of uniformity in the use of terms was found to prevail not only as between different metal-working industries, but even as between different establishments of the same industry, that the attempt to maintain this distinction in its entirety was found to be impracticable. It was usually possible to identify in any establishment a number of employees who deserved the title of skilled, all-around machinists. These employees have been brought together under that general occupation term. For employees of a less degree of skill, however, it was impossible to maintain any distinction based either on knowledge or on skill, which could be relied upon to give comparable figures between different parts of the country in the same industry and still more between different industries in which machine workers were employed. The only recourse was to throw machine workers who could not be identified as skilled machinists into one group. To that group has been given the general title Operators. As it includes people of varying degrees of skill and performing work requiring varying amounts of responsibility, the averages as given in the table are based upon returns embodying what must be recognized as an undesirably wide range of individual differences. They represent the average hours and earnings of all employees working at the specified metal-working machinery, except those who could be identified as machinists.

Wages and Hours of Labor in Anthracite Coal Mining Industry, 1919 and 1920.

THIS article presents in a summary form the facts as to the hours of labor and the earnings of employees in the anthracite coal fields of Pennsylvania in 1919 and 1920.

The figures for 1919 were gathered for the one-half month pay period ending January 31, while the figures for 1920 are for a similar period ending March 31. In the figures for 1919, 16,209 employees are represented, employed at 22 collieries of 10 companies, while for 1920, 10,821 employees are represented, employed at 16 collieries of 8 companies.

Five collieries for which figures are shown for 1919 are not included in the figures for 1920, because of circumstances which made it impossible to secure representative data from these establishments. Three collieries which furnished data in 1919 were shut down during the 1920 period because of floods which had drowned out the workings. Data were secured at two collieries in 1920, for which no figures were shown in 1919.

The periods for which figures are presented were ones of full production, all the collieries operating full time during the period in 1919, while only one lost any operating time during 1920. Out of 14 possible days of operation this colliery operated only 10 days, being forced to close down 4 days because of flood conditions.

The material on which this article is based was obtained directly from the pay rolls and other records of the several companies by agents of the Bureau. A record of the time spent in the mines by tonnage workers, which ordinarily does not form a part of the records, was especially kept during these periods. Because of the fact that the working places of the miners are widely distributed and at unequal distances from the entrances to the mines, the time checked was the time at which miners entered and left the mines. Consequently all figures relating to the hours of those miners and miners' laborers who work on a tonnage basis represent the time spent in the mines and not that spent at the working places. It is estimated that in general it takes the miners from 15 minutes to one hour to get to their working places after entering the mines.

The rates of wages and hours of labor in the anthracite coal industry in 1919 and 1920, by occupation, are shown in Table 1.

Total, inside and outside.....																	

At the foot of each division of the table are shown the hours and earnings of the entire number of employees working inside and outside, respectively, and at the bottom of the table are shown the figures for all outside and inside occupations combined. A word of explanation may be needed as to how the figures in some of the columns were obtained.

The average hours actually worked were obtained by adding the hours actually worked by all employees in the occupation and dividing the sum by the number of employees in the occupation. The figures in the column headed "Average hours worked per week day" were obtained by ascertaining for each employee in the occupation the full number of hours worked by him during the period and dividing that aggregate by the number of week days in the pay-roll period. The result represents the number of hours per day that would have been worked by the employee if the work had been distributed uniformly over the week days of the pay-roll period. By dividing the sum of the hours of all employees in an occupation by the total number of employees in that occupation the average number of hours per week day in the occupation is ascertained.

By full-time hours is meant the number of hours which are regarded by employer and employee as constituting a day's work. The average full-time hours of the pay-roll period given in column 5 were obtained by multiplying the regular daily working hours in each occupation by the number of days constituting the full half-month pay-roll period. The aggregate of such hours for all the employees in each occupation was divided by the total number of employees in the occupation. The quotient is the average full-time hours of all employees in the occupation.

The average earnings actually received during the pay-roll period were computed by dividing the aggregate earnings for all the employees in each occupation by the number of employees in that occupation. As this figure includes the earnings of part-time workers as well as those of employees who worked continuously during the entire period, care should be taken not to confuse it with the full-time earnings which are shown in the last column. The average hourly earnings were obtained by dividing the aggregate hourly earnings of all the employees in an occupation by the number of employees in the occupation. The average full-time earnings is the product of the average earnings per hour and the number of hours in the pay-roll period. The figure represents the amount that would have been earned by an employee in any occupation, if he had worked the full-time hours of the occupation and received the average hourly earnings of his occupation for each hour that he worked.

Most of the information about hours and earnings contained in the table can be easily interpreted without comment. Thus the data given for blacksmiths among the inside occupations show that in 1919 they were found to the number of 30 distributed among 13 establishments; that they worked on an average 8.9 hours per week day; that while their full-time hours for the half month were 112 they actually worked during the half month an average of 124.7 hours. The average amount of money earned

by these 30 blacksmiths was \$73.56 per person, which shows earnings at the rate of 59.2 cents per hour. Any blacksmith who earned that rate per hour and worked the full-time hours of his occupation and no more would have earned during the pay-roll period \$66.26, the amount shown as full-time earnings. As the corresponding figures for 1920 are in each case put immediately beside those for 1919, an easy comparison of the two years can be made.

Attention may be called to the relative hours of contract miners and contract miners' laborers. As will be seen from the part of the table for inside employees in 1919, the 4,887 contract miners included in the survey worked on an average 6.8 hours per day, while the average of 1,855 contract miners' laborers was only 5.6 hours. It would naturally be expected that the hours of the miners would be less than those of the miners' laborers. It has been the general practice in the past for a miner to work until he has brought down enough coal to keep his laborers busy for the rest of the day and then to leave the mine. Apparently the shortage of contract miners' laborers, which has prevailed for some time, has brought about a change in the practice in this respect. This shortage of laborers may be inferred from the fact that whereas formerly each miner employed one or more laborers to load the coal that he brought down, the figures in the survey show more than two and one-half times as many contract miners as contract miners' laborers. From this it is to be inferred that a large proportion of the miners remain in the mine and load their own coal; that they spend so many additional hours in loading coal that even when their hours are combined with the shorter hours of miners who depend upon laborers to load their coal, the average for the whole group of miners is very considerably increased, and, in fact, exceeds the average hours worked by the contract miners' laborers. It is probable that the relatively short hours of the contract miners' laborers in comparison with the hours of the miners were due to the restless spirit prevailing among the laborers at the time of the survey. This restlessness caused much shifting of laborers from mine to mine and from district to district in search of working places where either better conditions could be found or more money could be made.

A glance at the similar figures for 1920 shows that the 3,188 contract miners, for whom figures are presented, worked an average of 6.6 hours per day, while the 1,191 contract miner's laborers worked an average of 5.9 hours per day. Thus it is seen that while the working time of miners has decreased two-tenths of an hour per day and that of laborers has increased three-tenths of an hour per day the relation between them found in 1919 still exists, although the difference is now reduced to seven-tenths of an hour per day.

In Table 2 are shown data similar to that in Table 1, but giving the averages of each colliery separately, for two occupations, namely, contract miners, and contract miners' laborers.

TABLE 2.—HOURS OF LABOR AND EARNINGS, BY COLLIERY, IN THE ANTHRACITE REGION IN 1920.

Occupation, establishment, and colliery.	Number of employees.	Average hours.			Average earnings.		
		Hours worked in half month.	Hours worked per week day in half month.	Full-time hours in half month.	Earnings in half month.	Earnings per hour.	Full-time earnings in half month.

In will be noticed that in this table the average hours worked per day appear very low for colliery 1, establishment H. This is caused by the fact that this colliery was operated only 10 days during the period, while in computing average hours per day the time worked by the men during these 10 days was spread over the entire 14 days.

In anthracite mines generally high earnings are found in the same mines in which short hours are worked. For example, at colliery 1, establishment A, contract miners earned an average of \$1.003 per hour and worked only an average of 6.7 hours per day, while at colliery 2, establishment D, where they earned only \$0.812 per hour, an average of 7.8 hours per day was worked. Examination of the remainder of the collieries will show that while this relation does not hold at all collieries, yet the general tendency is that the earnings per hour and hours worked per day vary in inverse proportion. As this same fact

was found to exist in the figures for 1919, it seems that this relation between high earnings and low hours is caused by something other than a temporary condition.

In the following table the collieries have been divided into two groups, those in which the contract miners averaged 6.8 hours per day or more and those at which less than 6.8 hours per day were worked. Colliery 1, establishment H, has been omitted from this table because of the fact that it was in operation only 10 days during the 14-day period.

TABLE 3.—HOURS AND EARNINGS OF CONTRACT MINERS IN 1920.

Group.	Number of collieries.	Number of employees.	Average hours worked per day.	Average earnings per hour.
Group 1.....	7	1,330	7.0	\$0.867
Group 2.....	8	1,621	6.5	.997

In the report on the investigation of the anthracite coal industry in 1919, it was pointed out that the number of contract miners' laborers was abnormally low. The figures for 1920 indicate that the shortage of such labor has become more acute. Making a comparison between 14 identical collieries, we find that in 1919 there were 3,218 contract miners and 1,402 contract miners' laborers. In that year the number of laborers was 47 per cent of the number of miners. In 1920 there were found in the same collieries 3,027 contract miners and 1,049 contract miners' laborers. The number of laborers is now only 35 per cent of the number of contract miners. Under the mining laws of the State of Pennsylvania a man who desires a certificate to work as a contract miner must have been employed at least two years as a miner's laborer. Unless the present tendency toward shrinkage in the percentage of miners' laborers is reversed in the near future, the problem of securing an adequate number of qualified miners is likely to become serious.

An examination of any of the tables already presented will show discrepancies between the hours actually worked in many occupations and the full-time hours of the occupation and corresponding differences between actual earnings for the pay-roll period and full-time earnings, or the amount that would have been earned if the employees had worked the full-time hours of the occupation. The facts as to irregularity of work are presented in Table 4. Employees in each occupation are grouped according to the percentage of full time actually worked by them. In the first part of the table the number of employees in each group is shown, and in the second part the percentage which that number constitutes of the total number of employees in the occupation.

TABLE 4.—NUMBER AND PER CENT OF EMPLOYEES WORKING EACH SPECIFIED PER CENT OF FULL TIME, BY OCCUPATION.

¹ Less than one-half of 1 per cent.

An examination of the table brings out the fact that a very small percentage of the employees in either outside or inside groups worked exactly full time. Of all inside employees in anthracite mines 13

per cent are recorded as working full time and no more, while of all outside employees the corresponding number is 18 per cent. If the figures for the miners and the miners' laborers, that is, the employees who are engaged directly in mining and getting out the coal, are segregated and compared with the figures for the remaining employees of the mine, an interesting situation is revealed. It is found that of the 5,736 miners and miners' laborers only 26 per cent worked full time or over, whereas of all the employees in the remaining inside occupations 63 per cent worked full time or over and in outside occupations 69 per cent are found in the same class. The largest group of miners and laborers, constituting 47 per cent of the entire number, is found in the class which worked between 75 per cent and 100 per cent full time, while only 24 per cent of laborers in other inside occupations and 22 per cent of laborers in outside occupations are in that group. Further computation would show that the 5,736 miners and miners' laborers worked on the average 81.5 per cent of full time, while the 5,085 employees in other occupations, inside and outside, worked 104.2 per cent of full time.

The following table of index numbers shows the effect upon the wages of contract miners of the various wage increases that have been granted since 1913. The contract rates in effect in 1913 have been used as the base, and to this have been applied the successive increases.

Relative wage rates of anthracite contract miners.

1913.....	100.0
1914.....	100.0
1915.....	100.0
1916.....	107.0
1917, May.....	117.7
1917, December.....	133.8
1918, November.....	149.8
1919.....	149.8
1920.....	149.8

The first increase after 1913, amounting to 7 per cent on tonnage rates, was granted on May 5, 1916, making the index number 107.

Since 1916 three new voluntary agreements have been entered into, each of which provided an increase in rates. These agreements unlike those of former years, gave a percentage increase on the earnings which should be made instead of a rate increase.

By these agreements the rates in effect in 1916 have been maintained and all increases have been applied to earnings made at these rates. Thus the agreement effective May 1, 1917, provided for the addition of 10 per cent to the gross earnings of each miner at the rate in effect in 1916; this was replaced by an increase of 25 per cent on December 1, 1917; and finally on November 15, 1918, the latter increase was replaced by an increase of 40 per cent on the gross earnings at the 1916 rate. Under these last three agreements it will be seen that the net increase in miner's rates above the 1913 base has been 17.7, 33.8, and 49.8 per cent, respectively.

The agreement of November 15, 1918, automatically expired on March 31, 1920, and a new agreement is now being negotiated.

Increases in Rates of Wages in Bituminous Coal Mines.

IN THE MONTHLY LABOR REVIEW for December, 1919, (p. 227) there was published a table showing the relative increases in the rates of wages of inside employees in the bituminous coal mines in the Hocking Valley district of the Central Competitive Field from 1913 to 1917.

Since those figures were published there have been two changes in the rates in question. The first was the award of the Fuel Administrator in November, 1919; the second, the award of the Bituminous Coal Commission, which replaced the award of the Fuel Administrator and took effect April 1, 1920. The conditions prevailing and the circumstances leading up to these awards were discussed in the MONTHLY LABOR REVIEW for December, 1919 (pp. 61-78), and for April, 1920 (pp. 40-50).

The following index numbers show the relative increases in this district, from 1913 to 1920, including the effect of the awards by the Fuel Administrator and the Coal Commission.

The rates in force in 1913 have been used as the base, and are represented by 100. Occupations which were paid the same rate in 1913, and which have received identical increases since, have been grouped together.

The index numbers for occupations paid on a tonnage basis are based on the rate per ton for mine-run coal. In 1913 the rate per ton was given for screened coal; this rate has been converted to a mine-run basis by assuming that screened coal constituted 65 per cent of mine-run coal.

In computing the relative for all inside occupations combined, the index number for each group was weighted by the number of employees found in that group on the pay rolls of the companies in the Hocking Valley district visited by agents of the Bureau during the Industrial Survey of 1919. The sum of the weighted numbers was then divided by the aggregate of the weights, and the relative for the final group "All occupations combined" was thus obtained. This relative shows the average increase of all inside occupations.

It should be stated that the most recent increase in wages yields the inside employees collectively 29.7 per cent over the rates established in November, 1917. The average of the outside employees, however, is considerably lower than this figure and if weighted in a manner similar to that used for inside employees and then combined with the inside employees, the general average increase for all employees, inside and outside, would be the 27 per cent which has been announced as the increase granted.

INDEX NUMBERS OF RATES OF WAGES OF INSIDE EMPLOYEES IN BITUMINOUS COAL MINES IN THE HOCKING VALLEY DISTRICT.

(Rates for 1913=100.)

Occupation group and year.	Index number.	Weight number.	Occupation group and year.	Index number.	Weight number.

1917, November.....	181.3		1917, November.....	157.6	
1918.....	181.3		1918.....	157.6	
1919.....	206.9		1919.....	179.6	
1920, April.....	219.5		1920, April.....	204.4	
4. Pipemen:					
1913.....	100.0	110			
1914.....	100.0				
1915.....	100.0				
1916.....	105.0				
1917, April.....	126.6				
1917, November.....	177.0				
1918.....	177.0				
1919.....	201.8				
1920, April.....	213.0				

From the table it is seen that the different groups have had percentage increases that fall within a comparatively narrow range, with the exception of trapper boys and pick miners.

The large increase for trapper boys seems to be justified by the very low rate that they have been receiving for many years. The reason for such a wide difference in the percentage of increase between pick miners, with an increase of 71.8 per cent, and machine miners, whose increase has been 109 per cent, is not very clear, especially as in 1919 machine miners in the Central Competitive Field made average earnings of \$1 per hour, while hand miners in the same territory averaged only \$0.81 per hour.

The most apparent effect is that the payment of so much higher rates to machine miners will probably induce a large number of hand miners to become proficient in the use of mining machines. It would seem, however, that any such additional increases for machine miners beyond a certain point will ultimately make this style of mining less profitable and consequently less desirable to the operators than the old hand-mining method, and will cause them to hesitate in the installation of the expensive machines required. When this point is reached, the operators will be compelled to adopt the stand

that the miners have occupied since the first installation of mining machines, that of a preference for hand mining as opposed to machine mining. Just how much excess of labor cost machine mining can carry is problematical, but it is easily seen that if machine miners continue to receive increases in excess of those granted to hand miners, the point will be reached where machine mining will cease to be as profitable as hand mining. The rate paid under the last award for machine-mined coal in this district is \$0.94 per ton, while for hand-mined coal the rate paid per ton is \$1.116.

Decision of Kansas Court of Industrial Relations as to Wages on Interurban Railways.

THE Court of Industrial Relations of the State of Kansas announced on April 23 its findings in a case involving all classes of employees of the Joplin & Pittsburg Railway Company of Kansas and Missouri. The complainants were 158 members of a local union composed entirely of employees of the railway. The company operates an electric interurban road, carrying freight and passengers between various points in Kansas and extending also to Joplin, Mo. This necessitated the decision of a contention raised by the company that the court had no jurisdiction on account of the interstate character of the business, which would place the company exclusively under the provisions of the Federal transportation act of February 28, 1920.

This contention was decided adversely to the company, and it was permitted to answer as to the complaints of its employees. It first alleged a contract dated August 1, 1914, to run for six years, which it held to be in full force and controlling the subject of wages. It also denied that there was any controversy endangering or likely to endanger the operation of its business, and further alleged its financial inability to pay a higher wage. A large amount of evidence was taken, and it appeared that within recent years a strike of 80 days had occurred, paralyzing the business, and entailing a loss to the company of more than \$68,000. A similar strike of nearly one-half the same duration occurred later. Besides the loss to the company, there was the wage loss to the men and great economic waste in that portion of Kansas and Missouri served by the company. A wage controversy had been submitted to the joint chairmen of the War Labor Board, and a decision was rendered by them on July 31, 1918. This fixed the rate per hour for shopmen, barn men, motormen, and conductors. The least skilled labor of a mechanical nature was paid 42 cents per hour, while motormen and conductors began at 38 cents, and after one year's service were to receive 42 cents. A higher wage was paid to machinists, painters, and armature winders, being 51½ cents per hour. This award was to continue for the duration of the war, with right to ask for adjustments not sooner than six months after February 1, 1919. Since the War Labor Board had gone out of existence, the complainants referred their case to the State industrial court, while the company relied on the contract of August, 1914.

The court held that the contract of 1914 was not effective, and took into consideration the various elements involved in the case. Among these was considerable variety in skill and responsibility necessary for the performance of the various duties of the employees under consideration. The increase in cost of living was such that some of the workmen were unable to support their families without getting into debt or drawing on previous savings. Some did additional labor after having performed a full day's work at their regular employment. Reference was made in the opinion to the decision in the Topeka Edison Co. case, noted in the May REVIEW (pp. 52-54), as to the rights of workingmen to procure for themselves and their families "all the necessities and a reasonable share of the comforts of life." The factors to be considered, as wages in the locality for like work, cost of living, skill, degree of responsibility, character of employment, and qualifications of the individual employee were enumerated, as in the earlier case.

A serious difficulty was found to exist in the lack of financial ability of the employer. It was pointed out, however, that the court had recently authorized an increase in the charges of the company which would probably considerably increase its earnings. The duty of the court to permit a fair return was touched upon, but it was declared "that wages to labor should be considered before dividends to the investor, and that a business which is unable to pay a fair rate of wage to its employees will eventually have to liquidate." The industry was said to be essential, but its conduct necessitates the payment of such wages as would retain competent services. The situation was held to involve a threat of industrial strike, disorder and waste. It was felt, therefore, that the court should establish a wage scale, which was, however, restricted "to such employees of the respondent as are actually bona fide residents of the State of Kansas, and whose work is located wholly or principally within said State." The scale was to come into effect on the 1st day of May, 1920, and to continue in force for a period of six months, or until changed by agreement of the parties with the approval of the court. The following is the new wage scale:

Motormen and conductors:

First 3 months.....	45 cents per hour.
Next 9 months.....	48 cents per hour.
Next 12 months.....	51 cents per hour.
After 2 years.....	55 cents per hour.
Blacksmiths.....	55 cents per hour.
Blacksmith helpers.....	45 cents per hour.
Machinists.....	60 cents per hour.
Machinist helpers.....	45 cents per hour.
Carpenters, first class.....	55 cents per hour.
Carpenters, second class.....	48 cents per hour.
Painters.....	55 cents per hour.
Painters' helpers.....	45 cents per hour.
Pitmen.....	55 cents per hour.
Pitmen helpers.....	45 cents per hour.
Armature winders.....	60 cents per hour.
Armature winder helpers.....	45 cents per hour.
Car cleaners.....	45 cents per hour.
Headlight, tail-light and telephone men.....	\$135 per month.

All of said wages to be on the same basis heretofore existing as to hours of labor and overtime.

Rise of Wages in British Industries.

WHILE no serious stoppage of work has actually taken place since the railway strike of September, 1919, with the exception of the less disturbing molders' strike ending in January, there have been numerous threats of such calamities and in two instances at least strikes have been narrowly averted through the tactful and dexterous handling of the situation by the Government. In recent weeks the scramble for increases in wages has become more acute—each industry watching every other industry's efforts with apprehension lest its own advances should be surpassed by those granted to other workers.

It has become increasingly apparent also that the life of an agreement is to the last degree precarious. This is forcefully illustrated by the most recent demand of the railway men, noted elsewhere in this article, which was promulgated exactly five days after the final signing in March of the agreement arrived at in January. (See MONTHLY LABOR REVIEW, March, 1920, pp. 16-25.)

The dockers' success in winning a favorable report (See MONTHLY LABOR REVIEW, May, 1920, pp. 54 to 62) from the court of inquiry regarding their demand for a 16 shilling (\$3.89, par) per day minimum particularly seems to have incited other industries whose workers have perhaps felt superior to dock laborers as a class and who therefore did not view with equanimity the advances recommended for the dockers. Dr. Arthur Shadwell has recently said that the fact that dock labor is in a very large proportion uncertain labor—

* * * is entirely overlooked in the claim that other industries not subject to the same disabilities are entitled to the same treatment as dockers. Railway men, in particular, enjoy the great benefit of regular, assured, and permanent employment. The comparison is therefore fallacious, and furnishes no justification for tearing up a recent agreement concluded with all solemnity and infinite pains.

But I fear that reason and equity have nothing to do with the systematic pushing of alternate claims, which resembles a game of endless leapfrog. It has long been evident that there is in the background a concerted plan of campaign for making it impossible to carry on certain large industries by a ceaseless series of progressive demands. The object is to bring about the collapse of the "capitalist system," which is the first step toward the millenium. Agreements are merely obstacles to be ignored or smashed. And the worst of it is that those trade-union leaders who are honestly trying to get justice for the men and to keep the peace are sacrificed with the agreements they have concluded. They are placed in a humiliating and, indeed, impossible position. Their work is no sooner done than it is undone and has to be begun again.

During March and April, the following advances were agreed upon:

Engineering and shipbuilding trades, 3 shillings (73 cents, par) a week on April 1, and 3 shillings on June 1.

Miners, 20 per cent, with a minimum of 2 shillings (48.7 cents, par) a day.

Railway shopmen, 6 shillings (\$1.46, par) a week.

Road transport workers, 5 shillings (\$1.22, par) a week.

Agricultural laborers, 4 shillings (97.3 cents, par) a week.

Timplate and steel workers, 40 per cent.

Dockers, minimum of 16 shillings (\$3.89, par) a day.

The following claims are under negotiation:

Cotton operatives, 60 per cent on current rates.¹

¹ This was reduced to 35 per cent on Apr. 29, but the employers would offer 25 per cent only.

Tramway workers, 10 shillings (\$2.43, par) a week.

Omnibus workers, 10 shillings (\$2.43, par) a week.

Builders (London), 1 shilling (24.3 cents, par) an hour.

Postal workers, equivalent of prewar wages, with addition of 10 shillings (\$2.43, par) a week.

General workers, £1 (\$4.87, par) a week.

Shop assistants, at least 25 per cent.

Railway men, £1 (\$4.87, par) a week to all grades.

The Labor Gazette for April gives an account of the increase in rates of wages in the chief industries of the United Kingdom, from July, 1914, to the end of February, 1920. The percentages of increases would, of course, be considerably enhanced had they included the advances of March and April, 1920, noted above. The following is a summary of the Gazette's statement:

There is still a wide diversity between the increases granted to various classes of workers as regards both the actual advance in weekly wages and the percentage increase on prewar rates. In some cases, notably among skilled workmen in industries where the same flat rate advance has been applied to all adult workmen, the increase up to the end of February last was equivalent to only about 100 per cent, or less in some cases, on the prewar rate. On the other hand, in some other cases, particularly among the lower-paid grades in the same industries, the advances are equivalent to as much as 170 or 180 per cent on the prewar rates. While the information in the possession of the department is not sufficiently complete to enable the average percentage increase for all industries and occupations to be calculated exactly, it is estimated, on the basis of the available data, that the average increase in weekly wages up to the end of February, 1920, was about 120 to 130 per cent on the prewar rates. As the length of the working week has been considerably reduced in the same period, the usual range of working hours in industry generally being about 44 to 48 weekly, as compared with 48 to 60 before the war, the percentage increase in hourly rates would be substantially greater.

Miners.

THE Miner's Federation of Great Britain, early in December last, as a preliminary to an appeal to Parliament, undertook a vigorous campaign of propaganda for nationalization of the coal mines, basing their plea on the majority report of the 1919 Sankey Coal Commission, but they did not succeed in winning over public opinion to any great extent, and when on February 11, at the opening of the present session, a Labor member presented the case to Parliament, the result of the "division" of the House was 64 for and 329 against nationalization.

A month later a special trades-union congress rejected by a decisive majority (nearly 4 to 1) a resolution in favor of trade-union action (a general strike) to compel the Government to nationalize the mines. The miners' and engineers' unions made up nine-tenths of the vote in favor of a strike. At this time Mr. Smillie, the miners' president, and for many years their real leader, retired from active leadership on the plea of ill health, leaving Mr. Hodges, secretary of the federation, in aggressive control. The miners having been defeated in their move before Parliament, and not having gained the support of their fellow trade unionists to their proposal to launch a general strike, now presented to the Government a demand for an immediate increase of wages of 3 shillings (73 cents, par) per day for all adult members of the federation, and half that amount for boys under 16

years of age. The Government declined to accede to this demand, but made alternative offers as follows:

1. A flat rate advance of 1s. 6d. (36.5 cents, par) a shift for men and 6d. (12.2 cents, par) for boys; or
2. An increase of 20 per cent on the gross wages, excluding the war bonus and the "Sankey wage" (granted in 1919).

A series of conferences resulted in the Government's amended offer standing as follows:

An advance shall be granted of 20 per cent on gross earnings (exclusive of war wage and Sankey wage), so, however, that no person of 15 years or upward shall receive a less advance than 2s. [48.7 cents, par] per shift worked or per day worked, no person under 18 years of age but not under 16 years of age a less advance than 1s. [24.3 cents, par] per shift worked or per day worked, and no person under 16 years of age a less advance than 9d. [18.3 cents, par] per shift worked or per day worked. The advance shall apply to all classes of colliery workers employed in coal mines, or at the pithead of coal mines, whose wages have hitherto been regulated by the movement of wages in the coal mining industry, and shall take effect on and from March 12, 1920.

The federation officials decided to submit this offer to a vote of their members, and on April 16 the result was announced; 442,704 members had voted for acceptance of the Government's offer, while 377,569 had voted for a strike to enforce the original demand. The new terms, therefore, were accepted, and the first payment under them was made at the April 30-May 1 pay day. The advance is retroactive from March 12. The estimated cost of the concession is about £30,000,000 (\$145,995,000, par) per annum, and it is probable that an advance in the price of coal will soon be made to meet this cost.

During the discussion of the miners' demand it developed that public opinion quite generally admitted the justice of an increase to miners in view of recent advance made to other workers, noticeably the engineers and railway men, but equally generally considered 3s. (73 cents, par) a day an exorbitant demand.

Statistics relating to miners' wages are conflicting and many of the calculations are made on contentious data. Mr Hodges is reported to have stated that the average wage per person employed in the mining industry in 1914 (including boys) was 6s. 6d. (\$1.58, par) per shift. By the operation of the sliding scale which regulated wages according to selling prices of coal and by war wages granted in 1917 and 1918 the average wage per day was about doubled, and in 1919 the Sankey Coal Commission recommendation of 2s. (48.7 cents, par) per day increase was granted. The average number of shifts per week worked by the miners is said to be a little over 5. By using an even 5 the average weekly rates of wages, roughly, would be:

	£	s.	d.
1914.....	1	12	6 (\$7.91, par).
1918.....	3	5	0 (\$15.82, par).
1919.....	3	15	0 (\$18.25, par).

The miners asked for 3s. (73 cents, par) per shift increase, which would have resulted in an average weekly rate of about £4 10s. (\$21.90, par), a figure somewhat higher than the reported average wage of a fitter or turner in the engineering trade, namely, £4 7s. (\$21.17, par) a week. It should be remembered, moreover, that in the first instance the average wage included the wages of boys.

The following comparative statements taken from the London Times would indicate that up to the time of this settlement in the matter of weekly advances the miner had fallen behind the engineer, the weekly advances since 1914 being as follows: ²

Miners:	
Under sliding scale (approximately 3s. a shift).....	15s. 0d.
War wages (1s. 6d. a shift in 1917 and 1s. 6d. in 1918, six payments for 5 shifts).....	18s. 0d.
Sankey wage (2s. a shift worked).....	10s. 0d.
Total	£2 3s. 0d.
Engineers:	
Up to April, 1917.....	7s. 0d.
April, 1917.....	5s. 0d.
August, 1917.....	3s. 0d.
December, 1917.....	5s. 0d.
August, 1918.....	3s. 6d.
December, 1918.....	5s. 0d.
December, 1919.....	5s. 0d.
March, 1920.....	6s. 0d.
Total	£1 19s. 6d.

In addition, the engineer has a war bonus of $12\frac{1}{2}$ per cent on his total earnings (awarded October, 1917). Before the war the skilled engineer's rate was over 38s. (\$9.25, par) per week, hence with the advances noted it is now some 87s. (\$21.17, par), or a raise of 49s. (\$11.92, par), approximately, against the miners' 43s. (\$10.46, par). When the miners presented their demand of 3s. (73 cents, par) per shift to the Government, the prime minister declared that if the demand were conceded it "would knock the whole wage system of the country absolutely endways because it could not possibly end with the miners." The settlement of a guaranteed minimum advance of 2s. (48.7 cents, par) per shift gives the miners a total advance of 53s. (\$12.89, par) per week over prewar rates, and the effect upon the engineers who only get an advance of 49s. (\$11.92, par) per week, including their recent raise of 6s. (\$1.46, par) can not be foretold. In this connection it may be noted that the minority report of the Dockers Court of Inquiry (see MONTHLY LABOR REVIEW for May, 1920, pp. 54-62) quotes this remark of the prime minister in voicing the objection of its signers to the 16s. (\$3.89, par) minimum recommended for dockers.

Railwaymen's New Demands.

THE railwaymen's standardization of wages agreement ³ with the Government, embodying a sliding scale arrangement based on the cost of living, which was effected last January, was completed and signed on March 20. But whatever feeling of satisfaction and security may have accrued to the public thereby was of short duration, for on March 25 Mr. J. H. Thomas, the general secretary of the National Union of Railwaymen, wrote to Sir Eric Geddes, minister of transport,

² Value of £1 at par, \$4.866; 1s., 24.3 cents; 1d., 2 cents.

³ See MONTHLY LABOR REVIEW, March, 1920, pp. 16-25.

inclosing the following resolution "unanimously passed" by his executive committee:

That this executive committee having taken into consideration the effect of the sliding scale on the wages of our members and recognizing the serious position they are placed in from a wages point of view in relation to other industries, decides immediately to approach the Minister of Transport with the object of reviewing the position.

Following this letter a series of demands and amended demands were made to the Central Wages Board,³ culminating April 6, when the National Union of Railwaymen applied to the board for an increase of £1 (\$4.87, par) a week to all their members covered by the national settlement, with a further explanation the following day that locomotive men, whose wages had been standardized in August, 1919, were included in this demand, and that all previous demands were cancelled.

The Central Wages Board held meetings on April 9 and 13, and, according to the Railway Review of April 16, agreed that in accordance with the sliding scale locomotive men whose wages were fixed in August, 1919, when the cost of living was 115 per cent above normal should receive advances of—

One shilling (24.3 cents, par) a week from November, 1919, when the cost of living was 120 per cent above normal.

A further 1s. a week from December, when the cost of living increase was 125 per cent.

A further 1s. a week from March, 1920, when the cost of living increase was 130 per cent.

It was also agreed that other grades (than locomotive men) under the agreement effected in January should be granted an increase of 1s. a week owing to the increase above normal of 5 per cent in the cost of living, from 125 to 130 per cent.

The consideration of the demand of £1 (\$4.87, par) a week increase was postponed until another meeting to be held if possible before the end of the month.

It was further agreed that as a special case the board should meet again when the statistics as to the cost of living on May 1 should be available. This departure from the exact terms of the agreement (a review every three months) was understood to be entirely exceptional and due to the rise in the price of bread (from 9d. to 1s. (18.3 cents to 24.3 cents, par) for a 4-lb. loaf) on April 12 owing to the Government's partial withdrawal of the bread subsidy on April 1. This rise in prices, it was held, is not an ordinary market fluctuation.

The National Wages Board, which is the court of appeal from the decisions of the Central Wages Board, has held a meeting to discuss matters of procedure, and it is probable that the £1 (\$4.87, par) demand will be referred to it later on.

Mr. C. T. Cramp, the industrial secretary of the National Union of Railwaymen, in the course of a speech on April 18, as reported in the press, said:

The position of our latest demand for an increase on the standard rate is not generally understood. We made a settlement early this year which standardizes the conditions of railwaymen all over Great Britain, and the case of Ireland is now being considered. Within that settlement was a provision for a sliding scale based on the cost of living, as shown in the figures set out in the Board of Trade Labor Gazette, but that particular question must not be confused with the £1 [\$4.87, par] demand. Although the settle-

³ See MONTHLY LABOR REVIEW, March, 1920, pp. 16-25.

ment is of comparatively recent date, it must be remembered that it was accepted by a delegate meeting under protest, those words being explicitly included in the resolution, and it was only with the idea of obtaining the principle of standardization that they were accepted at all.

Now that we have settled the principle so far as standardization of conditions is concerned, we deem it a right thing to make a demand to raise the standard rate. The acceptance of the Government's offer to the miners gave an increase of 2s. [48.7 cents, par] a day. The recommendation of the industrial court, which inquired into the dockers' conditions, will involve a standard rate of 16s. [\$3.89, par] a day. When we made a settlement for locomotive men last August it was made, not merely on the cost of living which then obtained, but was intended to be a just recognition of the skill and responsibility which is possessed by locomotive men, and precisely the same in the other grades, except that we never considered they obtained what they were entitled to.

Now that these changes are taking place in connection with wage rates in other industries it is clearly the duty of railwaymen to see that their rates are also advanced, and that is why the £1 [\$4.87, par] increase is asked for. That is why it will be resolutely pushed forward. You can not in these days separate one industry from another in a way that was possible a few years ago. Negotiations become national and public. Parliament is always interested, and when the working classes realize that all questions of wages and hours affecting large industries are matters of national concern, they naturally desire that the standard of life shall, as far as possible, be equalized as between the various sections.

The acceptance of the January agreement "under protest," noted above, may be quoted later on by the miners who accepted the Government's offers on April 16 in accordance with a rather narrow majority vote of their members. In fact evidences of dissatisfaction have already appeared in Wales and other mining sections.

Mr. Cramp's statement that the locomotive men's settlement in August, 1919, was made not merely owing to the cost of living which then obtained but was intended as a recognition of the skill and responsibility of the men, is along the lines followed by the industrial court in establishing the amount of the award to the engineering trades in March. The court expressed the views that while during the exceptional circumstances of the war it was proper to take into account the cost of living as the principal determinant of wages, other considerations now arise. They held that the remuneration of the workpeople should, now that the war is over, depend on the value of the work done, that the value of the work done depends on the state of the market and that the market for engineering products at this time is in a state of exceptional activity, hence they decided upon an advance of 6s. (\$1.46, par) a week, one-half to become due on April 1 and one-half on June 1.

London Building Trade Operatives.

A FURTHER hindrance to meeting the very acute housing shortage in London was forecast on April 14, when the London District Council of the National Federation of Building Trade Operatives sent to the London Master Builders' & Allied Industries Association a formal four months' notice to terminate the agreement on working rules which was made between the two bodies last February.

The agreement as it stands provides that subject to certain exceptions the standard rates for skilled building-trade workers shall be (as of May 1) 2s. 0½d. (49.7 cents, par) an hour and for laborers 1s. 9d. (42.6 cents, par). The new rates which if granted would come into force on August 15 are stated to be 3s. (73 cents, par) an hour

and 2s. 9d. (66.9 cents, par) per hour, respectively. As the agreed working hours for builders are 46½ a week in summer and 44 in winter the new demand would amount, if conceded in full, to an addition of over £2 (\$9.73, par) a week to the wages of the workers.

A London builder commenting on this demand in a letter to the Times says:

* * * the cost of houses to be erected under the various "housing schemes" in the metropolitan area has been ascertained to be about £1.150 [\$5,596.48, par] per house at present prices. Half of this cost may roughly be taken to be for materials and half for labor. With this 50 per cent increase of wages the additional cost per house will be some £280 [\$1,362.62, par], making a total of £1.430 [\$6,959.10], but as there will doubtless be a sympathetic advance in cost of materials it would not be unreasonable to anticipate that the eventual cost of each house may reach £1.600 [\$7,786.46, par]. The county council proposes borrowing the money to pay for these houses at 5½ per cent. The economic rent, therefore, would seem to work out at £92 \$447.72, par] per annum.

Dockers' Agreement.

AT A meeting of the negotiating committees of the National Council of Port Labor Employers and of the National Workers' Federation held in London on April 19, 1920, the port employers agreed to accept "as a whole" the majority report of the Dockers' Court of Inquiry, a summary of which appeared in the May, 1920, issue of the MONTHLY LABOR REVIEW (pp. 54 to 62). The workers had previously accepted the report, and at this meeting it was further agreed that a joint committee of both sides should be set up to work out and settle the following essential details arising out of the report:

1. To whom does the report apply—(a) grades of men and (b) ports.
2. Settlement of differentials.
3. Basis of revision of piecework rates.
4. Safeguards—observance of hours of working and other agreements.

At the close of the conference the following further statement was issued by the committees:

Points of difference arising thereafter on the definition of grades and sections of workers, and details of working and in the actual carrying out of the agreement to be settled by submission to an independent arbitrator, agreed upon between the parties, his decision to be final, and accepted by both sides, or by some other effective method to be mutually agreed upon, the object in view being the stoppage of sectional strikes.

The Times (London) of April 20 comments as follows:

Stress should be laid on the fact that the employers have accepted the majority report "as a whole." The dockers' representatives signed it, and the Transport Workers' Federation accepted it "as a whole." The point is important, for the report was as much a report on output as on wages. It recommended the establishment of a national minimum wage of 16s. [\$3.89, par] a day, but it made this recommendation "on the footing that the hopes held out on behalf of the men of increased output shall not be frustrated." One of the questions referred to the new joint committee is "safeguards—observance of hours of working and other agreements." It would be invidious, in view of the admirable temper which has so far prevailed on both sides, to attempt to prejudice the decisions of the joint committee on this question. But the dependence of the new minimum wage on good timekeeping and conscientious work should be kept in mind at every stage in the negotiation of what has been called the "dockers' charter."

Greater Output in Industry.

THE British Government has set up a committee with the following terms of reference: "To consider and advise as to the best means of securing the greatest possible production consistent with the permanent well-being of industry and of the employers and the workpeople engaged therein." The committee consists of an independent chairman, two employers, two labor representatives, and two Government representatives, all of these being "permanent," and in addition there will be two representatives appointed by the employers and two by the workpeople to represent any particular trade which may be under consideration by the committee. The trade representatives will leave the committee when the inquiry has been completed so far as regards their particular trade and representatives of other trades will take their places.

The ministry of labor after consultation with the National Confederation of Employers' Organizations and with the parliamentary committee of the Trades-Union Congress appointed the "permanent" members of the committee, and is now in communication with the National Industrial Council for the Building Trade, which is the first trade to which it is proposed to give consideration regarding the appointment of "temporary" representatives to act during the time of such consideration.

The chairman of the committee is Sir Stephenson Kent, K. C. B., director general of munitions labor supply, 1916-1918, and controller general of civil demobilization and resettlement, 1918-19, who came to America on a Government mission in 1917.

MINIMUM WAGE.

Minimum Wages for Hotel and Restaurant Workers.

District of Columbia.

AN ACCOUNT of the conference called by the Minimum Wage Board of the District of Columbia to meet on February 3, 1920, for the purpose of recommending a minimum wage for women employees in hotels and restaurants, apartment houses, clubs, and hospitals, was given in the March issue of the *MONTHLY LABOR REVIEW* (pp. 132-136). Subsequently the board issued an order (M. W. B. Order No. 4), dated March 26, effective May 26, fixing the amount recommended by the conference, namely \$16.50 per week, as the minimum wage for the workers affected. The text of the order is as follows:

The Minimum Wage Board of the District of Columbia does hereby order that—

1. No person, firm, association, or corporation shall employ a woman or minor girl in any hotel, lodging house, apartment house, club, restaurant, cafeteria, or other place where food is sold to be consumed on the premises or in any hospital, at a rate of wages of less than $3\frac{1}{4}$ cents per hour, \$16.50 per week, or \$71.50 per month. This shall not be construed to include nurses in training.

2. When bona fide meals are furnished by the employer to any woman or minor girl employed in the establishments named in section 1 of this order as part payment of the wages of such employee, not more than 30 cents per meal may be deducted by such employer from the weekly wage of such employee. A record shall be kept of the number of meals furnished each woman and minor girl per week and of the deductions made from the weekly wage for the same; otherwise the full minimum wage rate shall be paid in cash.

3. When lodging is furnished by the employer to any woman or minor girl employed in the establishments named in section 1 of this order as part payment of the wages of such employee not more than \$2 per week shall be deducted by such employer from the weekly wage of such employee.

4. Tips and gratuities shall not be construed as part of the legal minimum wage. This order shall become effective sixty (60) days from date hereof.

Saskatchewan.

THE Minimum Wage Board of Saskatchewan has issued as its fourth order regulations governing female employees in hotels, and refreshment rooms.¹ The order fixes the maximum hours of labor at 48 per week unless by special permission in writing. No work period is to end between 12 midnight and 7 a. m. The minimum wage for experienced workers is \$14 per week, a three months' learning period to be permitted at a rate not under \$12 per week. No female under 16 is to be employed, nor any female under 18 to work after 8 p. m. Records of names, hours worked, and wages earned are to be kept. Meals are to be reckoned at not more than \$5.25 per week for 21 meals, and where lodging is furnished, \$2.50 is the maximum charge for full seven days. If aprons or caps are required, they must be furnished, laundered, and kept in repair by the employer. The customary regulations as to cleanliness, drinking water, lighting, ventilation, toilet rooms, wash basins, etc., are embodied in the order.

¹ Earlier orders were noted in the *MONTHLY LABOR REVIEW* for December, 1919, p. 266.

COOPERATION AND PROFIT SHARING.

Aims and Possibilities of the Consumers' Cooperative Movement.

By FLORENCE E. PARKER.

THE consumers' cooperative movement is one of vast possibilities—possibilities, however, which have as yet scarcely begun to be realized. The movement is growing rapidly, but it will reach its greatest opportunity for development only when it controls the sources of its supplies. Under the present system of distribution, the retail cooperative store is absolutely dependent upon the wholesalers, jobbers, manufacturers, and producers, all operating on the profit basis to which the cooperative movement is opposed. Cooperative leaders have long understood this difficult position and have looked forward to the cooperative undertaking by the consumers, step by step, of the successive stages—wholesaling, manufacture, transportation—backward toward and including the primary source of supply, the land. They hope for the time when cooperation will be substituted for competition and the needs of man, economic and social, will be supplied, not for profit but for use, by the organized consumer. This is an ambitious program, but the program of the movement, though not often formulated, has always been ambitious. The original Rochdale pioneers with their tiny shop in Toad Lane aimed to do no less than “proceed to arrange the powers of production, distribution, education, and government; or, in other words, to establish a self-supporting home colony of united interests.”

Because of its inherent possibilities, and because of the fact that it is being recognized more and more as a means of relief from our present industrial and economic ills, the cooperative movement deserves consideration. Under these circumstances it becomes important to know whether, and if so in what way, the cooperative is an improvement on the competitive system; whether the movement is capable of performing all those social and industrial functions that it is its avowed aim to undertake; what is the position of labor in the system; and what the universal application of the system would involve. It is impossible, of course, to review the subject exhaustively in a short article, but an attempt is made here to touch briefly upon the important points.

Democratic Aspect of Cooperation.

THE first claim to favorable consideration made by the cooperative movement lies in the fact that cooperation is the embodiment of industrial democracy. Membership is voluntary and open to all. Shares are of low denomination and may usually

be paid for in installments. At meetings each member has one vote and no more, regardless of the amount of stock held. In order to insure comparative equality in the financial status of members, the number of shares that may be held by any one member is limited. Capital receives interest at no more than a legal rate, it being the cooperator's idea that the owner of capital should receive a fair price for the use of his money, but no more than a fair price. The possessor of a great deal of money therefore has no more power in the affairs of the society and no higher status than his poorer fellow member. In the cooperative movement all are on the same footing. It has been said that the motive power of the movement is the man and not his money, and this principle is logically extended to every part of the movement, federations as well as retail societies. No financial group can obtain a controlling interest in the cooperative society; and a society can increase its power over the policy and operations of the cooperative wholesale society only by increasing its membership. On the other hand, all the economy which results from the combination of a large number of industrial operations under one management is obtained under the cooperative system through the method of federating societies for the purposes of wholesale trading and manufacture.

Cooperative v. Competitive System.

THE distinguishing feature of the cooperative system is that it exists for the common good. All land or buildings acquired become the common property of all the members. Every economy in manufacture and distribution, and every advance in efficiency or improvement in machinery benefits every member, instead of going to swell the profits of some one person.

It is obvious that the attainment of the aims of the movement on a universal scale means a readjustment of our entire economic system. However, it will probably be admitted that there is room for improvement in present conditions, particularly those under which distribution is carried on. Certain abuses have grown up under the present system which cooperation would correct.

Our present distributive system has become extremely complex, due partly to subdivision of effort. This subdivision has been carried to such lengths that even the vegetables bought by the housewife may have passed through the hands of as many as five different middlemen after leaving the farmer.¹ Each of these middlemen adds to the cost price a further charge to cover his expense of handling and a profit for himself, and in some cases to cover expense incurred by submitting the article to certain operations, tending to enhance its attractiveness but adding nothing to its value. It does not necessarily follow of course that the elimination of a middleman means a reduction of cost price to the consumer. It may often be true that subdivision makes for a greater real economy than would a system of more direct trading between the farmer and housewife. Nevertheless, distinction should be made between the subdivision that means a real service performed and that which simply adds to the cost. One

¹ U. S. Department of Agriculture, Bul. No. 267: Methods of wholesale distribution of fruit on large markets, 1915, p. 22.

practice existing under the present system, which is utterly to be condemned, is that of "resales within the trade" for purely speculative purposes. Cooperation would reduce to a minimum the intermediary agencies between producer and consumer by eliminating all unnecessary middlemen.

Probably one of the greatest sources of waste and one which burdens the consumer unnecessarily is the great duplication of retail selling machinery. The committee on markets, prices, and costs of the New York State Food Investigating Commission found that New York City had one store to about every 250 persons.² The existence of a dozen little shops where three would suffice to supply the needs of the community means, of course, that the price to the consumer must be large enough to cover the overhead expenses and profit of the superfluous nine. The cooperative system would eliminate this multiplicity. English statistics show that while the movement has grown, the number of societies tends to decrease slightly from year to year, due to the amalgamation of societies to avoid overlapping of the field of activities.

Under the competitive system, the consumer's wants are supplied by dealers whose interests are directly opposed to those of the consumer, whose motive is profit, and who have no direct interest in keeping the quality of the article up or in keeping the price down, so long as they make a profit.

Under that system the dealer or manufacturer does not confine himself to the supplying of articles which the consumer needs and wants. By campaigns of advertising he familiarizes the public with his commodity and creates a desire often where there is no real need for the article. The advertising cost must be covered by the ultimate price to the purchaser. At present also the purchaser has no assurance that the article he buys is of the quality he supposes it to be.

Under the cooperative system there is no advertising, and since no profit is involved, there is no incentive and consequently no attempt to induce the customer to purchase anything he does not want. And he has the assurance of quality in his purchase, since no one has any interest in deceiving him on this point. Only those articles are manufactured which members ask for. Each member, through his vote, can express his preference or disapproval of any articles furnished.

To the cooperator the motive underlying the present distributive system—profit—is wrong. He believes that the remedy is the management of the processes of distribution, manufacture, and production by the consumer, in the interests of the consumer. Under these conditions, the motive of gain being absent, all of the evils that now face the consumer—high prices (in the sense of being more than the article is worth), poor quality, adulteration, short weight, and waste in distribution—would disappear.

Production by the Consumer.

THAT it is possible for the consumers' cooperative movement to control all the stages involved in the production of the article handled by the cooperative store and do it successfully has been

² New York State Food Investigating Commission, Report of committee on markets, prices, and costs (Aug. 1, 1912), p. 7.

demonstrated in England. There the Cooperative Wholesale Society manufactures for the retail store such things as textiles, clothing, boots and shoes, cutlery, ironware, soap, tobacco, jams, pickles, vinegar, lard, bacon, cocoa, paints, and brushes. The wheat that goes into the manufacture of the cooperative flour is largely grown on the wholesale society's own land in Canada, and is transported to England in the society's own ships. The society owns and works about 30,000 acres of land in England, and its policy is said to be to buy up every acre of tillable land offered for sale in England.

The situation in England is described thus:

The cooperative consumer of jam or tea or boots is using what was produced in a factory owned and controlled by himself (and other cooperators) and distributed by his own agents. There is no manufacturer, merchant, commercial traveler, or dealer beyond himself and his own employees. There is no one buying at a low price to sell at a higher one, as is seen when the transactions from manufacturer to retail purchaser are carefully analyzed. True, there may be a "surplus" between the charge made by the manufacturing society and its total expenses of management; if so, this is returned to the purchaser. Hence, "profits as understood by the ordinary economist have no existence in the cooperative movement." (Catherine Webb: *Industrial Cooperation*, pp. 39 and 40.)

That cooperative manufacture even in England covers only a limited field is evident. The wholesale society manufactures only articles for which there is a demand from its members and these it manufactures only for its members, not for the open market. In other words it manufactures a limited number of articles, for a known market. The fields of agriculture and the broader industries, such as mining, construction, and transportation have hardly been touched upon. Whether the movement could successfully be applied to these fields is a matter for conjecture. It is argued, however, that if the field of cooperative effort has hitherto been limited it is because the membership of the movement has been limited. Its members are predominantly of the working classes, and it must therefore supply those things which the working classes demand. The contention is that if within the movement were included all classes of society the movement would be compelled to undertake the supply of the wants of all classes whatever those wants might be.

Position of Labor Under Cooperation.

IT IS admitted that one of the most important questions to-day is that of the adjustment of the conflicting interests of employer and employee. Anything that will accomplish this is deserving of the most thoughtful consideration. What cooperation offers in this respect can best be shown by the English experience.

With the growth of the movement, members of the cooperative societies, themselves, in most cases, employees, have in their capacity of cooperators, become large employers of labor—in 1918 the societies belonging to the English Cooperative Union employed a total of 164,383 persons. Thus has developed a most interesting situation which one writer has described as follows:

Cooperators have been faced with the labor problem in a double position. In their own lives, and in the factories and shops in which they work, in their traditions and their ideals, they belong to labor, and take naturally the standpoint of the employed and wage earner; in the cooperative society and factory, as cooperators,

they have been forced to look at the same problems through the eyes of the employer and wage payer. (Leonard Woolf: *Cooperation and the Future of Industry*, p. 65.)

The same writer, though admitting that there may still be co-operative factories in England in which "the wages paid are disgracefully low, the hours long, and the general conditions unsatisfactory," nevertheless declares that—

If you take the movement as a whole, there can not be the slightest doubt that the level of conditions of employment within it is higher than it is outside. All over the country cooperative societies will be found to be leading the way in the matter of fair wages and short hours, and this has been true of the movement from the earliest time. (Leonard Woolf: *Cooperation and the Future of Industry*, p. 66.)

Furthermore it is stated that the impulse toward the improvement of the conditions of the employee in the movement has come from within and not from without the movement.

Not only has the trade-union been recognized by the cooperative movement as the proper spokesman and champion of the employees but many of the societies require their employees to be trade-unionists. The position taken by the trade-unionists toward their cooperative employer is shown by the following:

An ardent trade-unionist, an employee of a cooperative society, once said to the writer: "Of course there's a difference between the relations of an employee to a capitalist employer and those of an employee to a cooperative employer. The object of the first is to smash his employer, for the only way to argue with capitalism is to knock it on the head. But practically no cooperative employee wants to smash cooperation; it's almost as much in the interests of the employee to spread cooperation as it is in the interests of the cooperator." These are strong words, but they show that the cooperative commonwealth was not altogether a dream. The difference in the relations, noticed by the trade-unionist, is due solely to the fact that the cooperative employee feels that, in a broad sense, his interests as a worker will be protected by the workers who are members of the society. That is the practical value of the democratic constitution which we examined in the last chapter. The whole of industry is very far from being cooperative; it will be a long time before the whole community are cooperators; and many cooperative employees are themselves not members of the movement. But the time has already come when the worker can at least feel that his interests are represented by a large body of workers in the membership of every society. There is in fact already to some extent a balance of power in the cooperative control of industry. That is why while the relations of labor to capital inevitably result in "class warfare," class warfare between cooperators and labor is inconceivable. (Leonard Woolf: *Cooperation and the Future of Industry*, p. 75.)

Cooperation as a Universal System.

AS TO whether cooperation will ever become universal, students of the subject differ. Theoretically, there seems to be no reason why the movement should not modify its structure and organization so as to include within its limits all forms of activity. However, since affiliation with the movement is entirely a voluntary matter it is doubtful if cooperation would ever become absolutely universal. The scope and limitations of cooperation have been well summed up in a recent book³ on the subject:

"The basis of the membership is a human being, pure and simple. Potentially, membership includes all society—it is all-inclusive. Consumers' cooperation is essentially a social movement, for the interests it represents permeate all society." The author of this book thinks, however, that cooperation being voluntary with the

³ Albert Sonnichsen: *Consumers' Cooperation*, New York, MacMillan Co., 1919.

individual, will never wholly supplant private enterprise. While theoretically it would accomplish the complete socialization of industry, there would always be an opportunity for "the private capitalist who could, or thought he could, carry on business in competition with the socialized industry," for the inventor, and for the man with originality and individuality in creative work. Cooperation "is based on the happiness, the free will, of the individual. It desires to include no one it can not benefit. When cooperation has spread just so far as it can benefit human beings it will stop, and be perfectly content to stop."

Russian Cooperative Movement.

By A. J. ZELENKO.

STATEMENTS concerning Russia are numerous and conflicting. Questions as to what statements are true are difficult to answer. Many of the things that are being said are, to a certain extent, true; in some parts of Russia these things may have happened, but one can not definitely credit them as applying to Russia in general. Those who travel through a country are impressed only by the things which they have come to observe, so that a particular occurrence may often present various aspects, according to the viewpoint of the person observing it. Such observations are, of necessity, only surface observations. The undercurrents in the life of a country present an entirely different aspect.

Russia is about two and a half times as large as the United States, and fully 93 per cent of its population is engaged in agricultural pursuits, leaving only about 7 per cent for the urban population. In Russia the people live in old settlers' communities. The farms are not scattered all over the country at long range from one another. The people there were naturally drawn together and they settled in groups, mainly for self-protection, because the severe winters, the vast stretches of waste country, danger of wild animals, and attack from Mongolian tribes in the olden times, were all elements to bring the people together.

Another fact to be taken into consideration is that throughout that vast Russian country the means of transportation has always been very poor, and the people of each village have been compelled to fill their own needs—supply their own food, weave and make their own clothing, and create almost every article necessary for their own daily life and work. They did not feel so much the need of the things produced by the city, because they were situated so far away from the manufacturing centers. Even now there are small communities in Siberia whose inhabitants can not reach the larger settlements without traveling for from two to six days at a time, and so these communities live just for themselves, producing everything to meet their daily wants. And the result is that approximately 37 per cent of all material used is made by the artisans working throughout the rural portions of the country.

From one point of view this communal self-preservation has been beneficial to Russia. The merchant class developed only weakly, and big industry has not been well organized. Private capital is not strong in Russia as it is in Europe where a greater percentage of the people live in large communities. In olden times, when the peasants needed wood they would meet, organize into a small group called an *artel*, and go together into the forests to cut it. Each *artel* would elect its own foreman to take charge of the work, and to divide the proceeds among the members according to their respective labors. In a similar way the fishermen along the seacoasts established *artel* fisheries, the farmers brought their dairy products together and founded *artel* creameries, and the men of the northern villages each year formed *artels* for their trip to the south to help in the reaping of the harvests. Thus it was in many other lines of the peasants' agricultural and industrial activity, and whenever a new enterprise was undertaken the spirit of cooperation was always present. And so by looking back over a thousand years it is found that cooperatives, in primitive form, have always existed in Russia.

In Russia the old feudal system left all power in the hands of the nobility, which represented the interests of the large landowners, and private commercial enterprise was so little developed that there was not much competition to be met in the organization of primitive cooperative undertakings. When in 1863 the peasants received their freedom and were no longer the slaves of the nobility, cooperative societies—based on the old natural group or *artel* enterprises, but now backed by modern methods and the possibility of establishing duly registered societies—sprang up and began to grow like mushrooms. In 1865 the first cooperative society, with written resolutions and by-laws, was organized; in 1874 there were 353 such societies; in 1917 the number had grown to 59,753; and in 1918 there were about 50,000 individual societies. In that same year there were twenty million members of the cooperative movement, the majority of whom were householders, and, with their families, brought the total number of cooperators in Russia to about one hundred millions. Their power is shown by the fact that after the great war, and during a time of civil war and a great lack in the means of transportation, the cooperative societies in 1918 had a turnover of 10,000,000,000 rubles (\$5,150,000,000, par), which surely demonstrates their ability to buy and dispose of merchandise among the members of the cooperative societies even during that most trying period in the history of Russia.

Types of Russian Cooperatives.

THERE are four types of cooperative enterprises in Russia: The consumers', producers', savings or credit, and insurance cooperative societies.

Consumers' Societies.

Usually the consumers' cooperative society is undertaken because of the villagers' dissatisfaction over the prices and quality of the goods furnished by the village grocer. Perhaps they know also that the people of the adjoining village have a cooperative store and are already receiving dividends. The villagers apply to the regional

union, an organizer is sent to their village, statutes are discussed, by-laws approved, and a new society is born.

Sometimes societies have failed because they did not have money enough to compete with small private enterprises in the villages, and did not wish to join in the union of societies. Sometimes, too, they selected some dishonest salesman who took advantage of the people. When these societies came to realize that they really needed the sustaining aid of other societies, and that they would benefit by mutual help, they joined the regional unions mentioned before, where the representatives of the respective societies in a certain region or county came together for buying. Each of these regional unions may be composed of 10, 20, or even 1000 societies. There has never been a failure of any such union. The shares belong to the societies, but not to individual members, and are taken in proportion to the membership of the retail societies. Altogether there are about 500 regional unions, and some of them, like the Union of Siberian Cooperative Unions ("Zakoopsbyt"), the Petrograd Wholesale, the Don-Kubon-Terek Union, and others, are very powerful societies, which build and conduct their own factories. They manufacture soap from fats, they make butter and cheese in large dairies, conduct shoe and tobacco factories, and sell these products back to their own members, the small village societies. Besides this work, they each year set aside enough money from the profits to maintain a corps of instructors and experts in many fields of educational work for the benefit of their members.

The regional consumers' unions merge again into a central wholesale union in Moscow, called the All-Russian Central Union of Consumers' Societies, which was organized in 1898. In 1918 its membership consisted of 500 federations, comprising 40,000 local societies and about 12,000,000 individual members. During that year its capital amounted to 100,000,000 rubles (\$51,500,000, par), and its turnover was 2,000,000,000 rubles (\$1,030,000,000, par). This union operates flour mills, candy, shoe, tobacco, soap, sirup, chemical and match factories, refrigerator plants, and fisheries, valued at 800,000,000 rubles (\$412,000,000, par).

Producers' Societies.

Since 93 per cent of the population is rural, it will be easily understood that many types of producers' societies were formed for the purpose of disposing of the respective yield of each agricultural activity. Thus there are producers' societies for the marketing of eggs, butter, hemp, flax, timber, furs, fish, etc.

The next step is the organization of a group of societies into a union. According to their various specialties, the producers' unions are also organized into central bodies such as the Central Egg, Union of Siberian Creamery Associations, Central Hemp, Central Flax, Central Lumber, Central Truck Gardeners, Central Potato Starch Producers, etc.

Even before the beginning of the Great War, about 60 per cent of the Russian butter sold abroad belonged to the cooperative unions; about 40 per cent of all the eggs were marketed by cooperative societies; and about 75 per cent of all the flax, as well as about 60 per cent of the hemp, was grown by cooperators.

The latest consolidation is that of the various small artisans in the rural districts, and even in the cities, into artels of shoemakers, makers of clayware, toy makers, felt makers, hardware producers, and other small craftsmen, who have organized their own respective producers' societies, and now combine in the central artisan union called "Kustar Union." Since the Russian cooperative credit unions came to the assistance of the artisans, the latter have been greatly helped in their competition with private concerns, for they can obtain the necessary credit from the bank to purchase raw materials and can commission the bank to sell the finished products, receiving in advance about 80 per cent of the final selling price.

In Leipzig, Germany, is the world-renowned fair of toys, which are later sold not only in Germany, but to England, America, Africa, and Australia. Even before the war the Russian artisan unions sent representatives there and sold millions of marks' worth of toys.

What has been the result of this cooperative plan of work? When the Russian industries stopped because of the lack of materials, transportation and other difficulties, the small artisan increased his production to meet the necessities of his country. We hear that big industries have been destroyed, but the country is still being supplied—perhaps it is being supplied insufficiently, especially in so far as manufactured goods are concerned, but nevertheless the people are being furnished with at least the bare necessities—and the reason is that the small artisans have developed and increased to such an extent that they are able to help themselves and their countrymen survive until common enterprise and mutual help enable the Russian people to restore their means of production.

Credit Societies.

Banking facilities not being well developed in Russia, the cooperatives established credit societies in many villages in order that the members might deposit their savings, or obtain credit when necessary. For instance, if a farmer wishes to make improvements on his homestead, he may go to his credit society and receive the required money on credit. But not only do the individual cooperators need the credit extended by the credit or savings societies; the societies themselves, as well as the large wholesale unions, require money with which to carry on their immense business transactions. They borrow money not only from the regional credit unions, into which the small local credit societies are combined, but also from the central cooperative bank in Moscow, called the Moscow People's Bank. The cooperative unions and societies own all the shares of this bank, and elect the members of the board of directors to control the management of the business. The bank is the clearing house for all kinds of large cooperative enterprises; it finances the consumers' and producers' unions, and also helps in the transactions of the central producers' unions, by buying for them at wholesale prices all needed materials in the line of agricultural machinery and supplies. Founded in 1912, the bank in 1919 had a capital of 100,000,000 rubles (\$51,500,000, par), and a turnover of 5,823,578,394 rubles (\$2,999,142,873, par). Recently a special union called "Selskosiuz," has been organized by the unions interested in buying agricultural im-

plements, and this new union now works independently of the Moscow People's Bank.

Insurance Societies.

Cooperative insurance societies came into existence during the war. Here in America insurance is generally carried on by private companies, but in Russia insurance has already been managed successfully on a large scale by cooperative societies.

Extent and General Aspects of the Movement.

ALTOGETHER there are no less than 50,000 small societies spread over the entire country. In almost every large village one will find a small retail store, very often a farmers' or small producers' society, and a savings bank or credit society. Each of these four has its own separate constitution and its own board of directors, but some of the members are workers and members of consumers' as well as producers' and credit societies.

To correlate, harmonize, and defend the interests of the cooperatives on questions of national importance, there is in Moscow the All-Russian Council of Cooperative Conventions, where all branches of cooperative activity are represented. This council has only consultative and advisory power, as all economic transactions are carried on directly through the respective unions.

Cooperative activity has also found a special field among the industrial workers and various State employees, such as the postal and railroad officials and municipal clerks. Here the consumers' societies established their foothold. Many years ago the proprietors of the factories started stores from which their workers might buy supplies. In many instances these stores were carried on conscientiously and honestly, but in others the workers were forced to pay unfair prices, as their salaries were paid in checks which had to be presented at the stores for exchange in merchandise and groceries. Gradually the more progressive employers introduced a system of cooperative stores, in which part of the capital was supplied by the employer himself, and the rest by shares sold to the employees. Such stores were known as "dependent cooperative stores." But the workers desired to reorganize and to become independent. A campaign was launched, many stores were bought out, especially during the past six or seven years, and as a result the dependent store has gone into the archives of history. Labor cooperation is conspicuous because of its generous grants of profit money for the educational and social uplift of the members and their families. The same should be said of State and municipal employees' cooperative societies.

Though the city dweller was last to enter the movement, his delay in joining the movement is natural. The city is individualistic, its population is fluctuating, and the interests which its people have in common are more often intellectual, esthetic and political than economic. But the Great War, revolution, and civil strife, followed by economic disaster and high living costs have shown them more clearly the urgent need of economic cooperation, with the result that the cooperative movement has spread rapidly in the cities, where members are now counted in tens of thousands. This common

economic enterprise has brought the members and their families in closer contact with one another, and thus has fostered the organization of many social enterprises for the benefit of the various members of the families, such as the establishment of kindergartens, playgrounds, libraries, summer camps, cooperative vegetable gardens, and many other kinds of recreation.

The proportionate growth of cooperation among the various classes of society is shown by the fact that 86 per cent of the peasantry, 7 per cent of the industrial workers or laborers, and 7 per cent of the middle class are engaged in cooperative enterprises.

Such has been the activity of the Russian cooperators that the movement has outgrown national lines. Even before the war the largest unions established headquarters in other countries. The Moscow People's Bank, the Union of Siberian Creamery Associations, the All-Russian Central Union of Consumers' Societies, and the Union of Siberian Cooperative Unions ("Zakoopshyt"), opened foreign offices. Offices are now maintained in London, New York, Paris, Constantinople, Stockholm, Christiania, Copenhagen, Helsingfors, Warsaw, Berlin, Marseille, Harbin, Shanghai, Kobe, and Yokohama, as well as at all the principal ports of Russia, such as Archangel, Murmursk, Vladivostock, Novorossysk, Rostov-on-the-Don, Odessa, and Petrograd. In addition to the above the All-Russian Central Union of Consumers' Societies maintains branches in Northern Persia and throughout Mongolia.

Millions of dollars' worth of goods have been bought and sold in these various countries, by working in conjunction with the English and other national wholesale societies, in the hope that the cooperatives may protect the economic interests of the Russian people abroad as well as they have protected them at home. Rice is bought in China, tea in India, cocoa in America and Java, and machinery in America and England, at wholesale prices, and thus large amounts of money are saved every year.

Educational and Social Work of the Cooperatives.

THE educational activities of the cooperatives may be divided as follows:

1. Extension courses for the young people in the country.
2. Summer courses to prepare instructors and lecturers.
3. Short winter courses for village bookkeepers.
4. Regular university courses for higher cooperative training.
5. Peasant universities. There are already five or six peasant universities established throughout the country along the lines of the Danish University which peasants may attend during the winter months, to receive instruction in agriculture, farming, home economics, and civics. Many groups are sent to the educational department of the central unions.
6. Cooperative elementary and high schools. There is a new movement on foot to establish new types of elementary and high schools for children, by employing only methods based upon cooperative principles.

There are no less than 500 wholesale consumers', producers', and credit unions in Russia, and each has its staff of traveling lecturers,

bookkeepers, managers, and experts in agricultural and various kinds of local industries, who are constantly visiting the different societies in their districts. Altogether there are at least 3,000 such instructors engaged in this work. These instructors are also trying to introduce more intensive social and educational training among their groups. If a local society decides to start a village library, the members ask the district wholesale union to send the material, and the latter in turn applies to the central wholesale union which prints its own books, or buys whole editions direct from private firms. Not less than a hundred thousand books and ten million pamphlets have been printed during this past year to be resold in the small cooperative societies.

The instructors try to satisfy the needs of all generations. The older folk gain information regarding agriculture, bootmaking, bee culture, and the lumber industry. The young people are supplied with material for their literary, social, and theatrical clubs. The unions sometimes keep special instructors who go into the villages to show the people how to start their dramatic ventures. The wholesale center keeps on hand a large stock of theatrical paraphernalia, ranging from scenery and costumes to wigs and other make-up, which it sells or rents at a nominal charge. It is an exciting event in the life of a young peasant boy to find himself transformed to represent a foreign courtier, an old Russian knight or boyar, a banker, or a merchant. For the most part the plays produced are of very good social and cultural value, and with the aid of the instructors the best classical works are introduced. The older folk often protest against all these "extravagances" brought by the younger generation, but are finally persuaded that theatrical performances were used by the church in medieval times, and are slowly being won over. Very good guidebooks for the people's theaters are written by the cooperative instructors, and the best dramas and comedies are published in very inexpensive form for from 5 to 15 cents apiece.

The cooperatives have opened many tea houses throughout Russia, and take great care that these are made real social centers. They are ever watchful to see that these places are kept clean and the atmosphere made attractive and congenial. In these houses daily newspapers are kept, meetings called, and now and then a lecture arranged. When the war broke out and the Russian Central Government prohibited the sale of liquors, many houses run by the liquor dealers were taken over by the cooperatives, and thus the problem of transforming saloons into clubhouses was practically solved in Russia as long as five years ago. About three or four thousand tea houses are already in operation there.

A typical arrangement for a cooperative commonwealth center consists of a store which is connected with the tea house, a room for the village bank where the local credit society has its office, another little room where the board may hold its meetings, and very often a storehouse for agricultural implements. The All-Russian Central Union of Consumers' Societies has also published a book which has already passed its fourth edition, entitled "How to Build and Control People's Houses."

When a traveling lecturer or instructor arrives at the village with his lantern and pictures, the boys of the village rush through the

streets, excitedly announcing at every house, "The city uncle has arrived, and will show us some new pictures." Gradually the school-house, the social center, or the library building, as the case may be, is filled to overflowing. After crossing himself upon entering, every one greets his neighbor with a hearty "Good evening." Children are everywhere, and those who have been unable to crowd inside the building press their little noses against the windowpanes in order to see the pictures. The instructor lectures while showing his pictures of agricultural or geographical interests, light comedy, or the activities and progress of other cooperatives which the people of this village have not yet attained, and thus a feeling of competition is aroused in the community. If the lecturer knows the people, and can express himself to them in their own simple village language, he is able to grasp the relative strength of the conservative and progressive elements of the village cooperative society, and understand just how much progress he can make at one time, and what he will have to emphasize most during his next visit. Thus the contact between the officers and the privates of this big cooperative army is formed. New leaders are constantly being developed, and faithfulness to the cause in times of stress or failure is inspired in the young workers.

Conclusion.

AT THE crucial point in Russian history, when everything has been in an unsettled condition, the cooperative unions have stood firmly. In 1918, when practically the entire country was divided into five separate parts, the cooperatives were still able to carry on their work and bought, sold, and distributed among their members about 10,000,000,000 rubles' worth of goods (\$5,150,000,000, par). This shows that they have worked in spite of political separations, for the cooperative societies are economic organizations endeavoring to remain apart from political matters.

Every citizen wishing to become a member of a society may do so, for none will ask his political opinion or religious belief; thus there are both conservatives and radicals in the societies. It is the right and duty of every citizen to express his political convictions, but it is done in political, rather than in economic, groups. It is, of course, natural that the cooperators from the industrial centers should be more radical than the cooperators from the agricultural communities, and that a member of the credit union who has been able to save a small amount from the proceeds of his toil is more conservative than the man who has only one capital—the strength of his hands.

The cooperative movement is a product of historical conditions, geographical situations, and cultural background. It can develop only along its organic lines and will adapt itself to the new conditions of life in accordance with its main natural requirements—the freedom to build and to rebuild social groups for the benefit of each member. The cooperative idea is not hostile to the political systems as long as those systems do not interfere with the principle "for the people, by the people, through the people." What the cooperatives need is the right to show initiative, and to have freedom and power vested in the social groups to organize common-welfare enterprises in which everyone is free to join if he so desires. The Russian cooperatives

firmly believe that such freedom within the State will be reached. And, as the State requires the services of the cooperatives for urgent national needs, the cooperatives have always considered it their duty to help the State and will continue always to do it.

Progress of Cooperation in Various Countries.¹

Denmark.²

DURING 1917-18 the cooperative movement in Denmark was greatly affected by the continued reduction in imports, the shortage of raw material, and difficulties in transportation. The adverse effect of these conditions on the Cooperative Wholesale Society is shown by the fact that the amount of business done by it decreased from 81,581,786 kroner (\$21,863,917, par) in 1917 to 74,043,050 kroner (\$19,843,537, par) in 1918. The wholesale society manufactures hosiery, ready-made clothing, bicycles, cement, rope, soap, cigars, tobacco, marmalade, candy, wines, tea, spices, and margarine. The productive departments were particularly affected by the conditions mentioned, the value of their output decreasing from 17,668,395 kroner (\$4,735,130, par) in 1916 to 16,377,979 kroner (\$4,389,298, par) in 1917 and to 9,598,531 kroner (\$2,572,406, par), in 1918.

The following table shows the activities of the Danish Cooperative Wholesale Society during the period 1914 to 1918:

OPERATIONS OF THE DANISH COOPERATIVE WHOLESALE SOCIETY, 1914 TO 1918.

[1 krone at par=26.8 cents.]

Year.	Number of affiliated societies.	Number of members.	Amount of business.
			<i>Kroner.</i>
1914.....	1,497	219,492	69,588,824
1915.....	1,468	232,128	71,458,207
1916.....	1,537	239,772	84,510,390
1917.....	1,574	245,544	81,581,786
1918.....	1,604	250,224	74,043,050

France.³

IT IS stated that the French cooperative societies have been very active during the war. A number of the activities have been carried on in conjunction with the various public administrative

¹ The data on which this article is based were obtained from the International Cooperative Bulletin, issues of August and September, 1918, April, August-September, October, and November, 1919, and February and March, 1920; International Review of Agricultural Economics (Rome), August-September-October, 1919; People's Yearbook, 1920; Political Science Quarterly, March, 1920; Jahrbuch des Zentralverbandes deutscher Konsumvereine, 17 Jahrgang, Hamburg, 1919; Report of the agricultural branch of Bengal (India) Revenue Department on the Working of the Cooperative Societies in Bengal, 1918-19; The Cooperative Movement in India, by P. Mukherji; and Special Report No. 13 (as yet unpublished) to the Bureau of Foreign and Domestic Commerce of the U. S. Department of Commerce on the Cooperative Movement in the Netherlands.

² A short general account of the cooperative movement in Denmark was given in the MONTHLY LABOR REVIEW for March, 1919, p. 143.

³ Short accounts of the cooperative movement in France have appeared in the MONTHLY LABOR REVIEW for March, 1919 (p. 142), and October, 1919 (p. 178).

bodies, municipalities and State Departments. In August, 1915, the cooperative societies offered to the Government their services in the distribution of frozen meat which the Parisian butchers were boycotting. The Cooperative Wholesale Society opened two of its own cold-storage depots, and the Cooperative Union of Paris was organized to carry on in Paris the work of distribution. It soon extended its activities to include other commodities and finally became the center of all the cooperative activities in Paris. It opened a cooperative restaurant whose receipts in 1918 amounted to 5,911,005 francs (\$1,140,824, par), and a number of stores, the majority of its supplies being obtained from the wholesale society. It is stated that in December, 1919, the union had 30,000 members, was operating 214 stores, and doing an annual business of 50,000,000 francs (\$9,650,000, par).

Figures for the consumers' cooperative associations show that for 79 Departments, not including the devastated areas, the number of societies has decreased from 2,478 on January 1, 1914, to 2,233, and this in spite of the fact of its being reported that between August, 1914, and July, 1918, 575 new societies had been organized. The membership of these associations increased from 600,782 in 1914 to 1,129,684 in 1918 (a rise from 242 to over 500 in the average membership) and the amount of sales from 208,000,000 francs (\$40,144,000, par) to between 560,000,000 and 570,000,000 francs (\$108,080,000 and \$110,010,000, par). It is pointed out, however, that while the figures for 1918 do show a slight increase in actual business done there is "no ground for exultation, for the increase has only kept pace with the rise in prices."

The Cooperative Wholesale Society has increased its membership from 141 societies in 1907 to 423 in 1918, and 1,088 in 1919, and its sales from 1,877,181 francs (\$362,296, par) in 1907 to 41,270,668 francs (\$7,965,239, par) in 1917-18 and 76,613,184 francs (\$14,786,345, par) in 1918-19. The value of goods manufactured by it increased from 3,797,553 francs (\$732,928, par) in 1917-18 to 6,818,096 francs (\$1,315,893, par) in 1919. The Cooperative Wholesale Society has its own bank, does a large business in wines, and operates boot and shoe factories at Fougères, Amiens, and Lillers.

Alsace-Lorraine.—Shortly after the signing of the armistice the cooperators of Alsace-Lorraine sought and obtained affiliation with the French cooperative movement. Subsequently they received a credit of 5,000,000 francs (\$965,000, par) from the French Government; assistance in the purchase of goods was rendered by the French Cooperative Wholesale Society. In many of the smaller towns and villages, branch stores have been organized.

The Strassburg society had an increase in membership over 1918 of 6,539, in spite of the fact that with the expulsion of Germans it lost 600 members. The society now supplies 25,000 families. Its sales in 1919 amounted to 10,161,452 francs (\$1,961,160, par). The society employs 259 persons, whose wages and conditions of employment have been agreed upon with the trade-unions.

Germany.⁴

THE Yearbook of the Central Federation of German Consumers' Cooperative Societies for 1919 contains a wealth of data on the development in Germany during the war of the cooperative movement in general and of consumers' cooperative societies in particular.

In the following table is shown the number of the various classes of cooperative societies registered on January 1 of the years 1914 to 1918:

COOPERATIVE SOCIETIES REGISTERED ON JANUARY 1, OF EACH YEAR, 1914 TO 1918

Class of society.	Number of societies in—				
	1914	1915	1916	1917	1918
Credit societies.....	19,203	19,568	19,620	19,693	19,793
Industrial societies dealing in raw materials.....	436	462	542	662	856
Agricultural societies dealing in raw materials.....	2,429	2,565	2,621	2,703	2,756
Societies for the purchase of merchandise.....	317	338	347	426	493
Establishment societies:					
Industrial.....	348	361	360	351	340
Agricultural.....	1,909	2,073	2,070	2,160	2,218

Consumers' societies.....	2,340	2,320	2,283	2,280	2,277
Housing and building associations:					
Paper.....	1,346	1,403	1,386	1,382	1,391
Society houses.....	128	139	143	140	138
Other societies.....	378	380	353	364	371
Total.....	34,579	35,481	35,746	36,565	37,284

It is apparent that the number of cooperative societies has not undergone any considerable change during the war. The relatively large increases in the number of societies dealing in raw materials, those purchasing merchandise, and the industrial productive societies are to be ascribed to the close cooperation of the handicrafts in the purchase of raw material from the State central distributing office. The small decrease in the number of consumers' societies is due to the consolidation of the societies into district societies and also to the fact that a number of small societies which were not affiliated with strong central organizations were not able to cope with the difficulties caused by the war.

The number, class, and membership of the societies affiliated with the five largest central organizations of cooperative societies are shown in the following table for the period 1914-1916:

⁴ A short general account of the cooperative movement in Germany was contained in the MONTHLY LABOR REVIEW for March, 1919, pp. 140, 141.

NUMBER AND MEMBERSHIP OF REPORTING COOPERATIVE SOCIETIES AFFILIATED WITH THE FIVE LARGEST CENTRAL ORGANIZATIONS, 1914 TO 1916, BY TYPE OF SOCIETY.

It may be said that the above five central organizations represent the great majority of consumers' cooperative societies in Germany. The decrease in membership of the credit societies affiliated with the central organizations is probably due to war losses, since the members of these societies are largely middle-class people and small farmers.

The development of the cooperative movement of German consumers' societies during the period January 1, 1903, to January 1, 1919, is illustrated by the following table.

DEVELOPMENT OF THE CONSUMERS' COOPERATIVE SOCIETIES, JAN. 1, 1903, TO JAN. 1, 1919.

[1 mark at par=23.8 cents.]

Item.	Jan. 1, 1903.	Jan. 1, 1919.	Increase.

Credits for discounts, and surplus.....	22,066,600	50,637,000	28,570,400	129.7

1 Decrease.

The consumers' cooperative movement now includes one-fifth of the population, if the families of members of consumers' societies are considered. Even the powerful economic disturbances caused by the war could not retard the development of consumers' societies.

The relatively larger increase in sales as compared with membership of these societies shows that the members have patronized the stores of their societies to a greater extent than before. Another noteworthy fact is that the sales of articles produced by the societies themselves showed an increase of 720 per cent. This figure does not include the articles produced by the Cooperative Wholesale Society. Production by societies themselves is so increasing that soon one-half of the articles purchased by organized consumers from their societies will have been produced either by the societies themselves or by their Cooperative Wholesale Society.

Discount sales of noncooperative concerns to members of consumers' societies have decreased 55.5 per cent. These sales include only articles which the consumers' societies do not keep in stock. As the consumers' societies are continually enlarging the number of articles for sale in their stores, discount sales by noncooperative stores decrease proportionately. During the war, moreover, when stocks in all classes of stores were very low, a number of noncooperative concerns which had discount contracts with consumers' societies refused to live up to these contracts or to renew them.

The value of stocks of merchandise rose 194 per cent. The relative increase is smaller than that of sales, which is probably due to the great scarcity of all kinds of merchandise during the war.

The capital of the societies consists of share capital and of the reserve funds. The share capital increased 208 per cent. The reserve funds increased 493 per cent. The share capital and the reserve funds combined show that the financial strength of consumers' societies has increased considerably but not enough to make

satisfactory the financial condition of the societies. There was an enormous increase in savings deposits—1,972 per cent. These savings deposits may, however, be withdrawn by the members on short notice, and must, therefore, be invested in quick assets. In order to put the consumers' societies on a sound financial basis the funds required for their operation should, however, be the societies' own funds and be composed chiefly of share capital and reserve.

The item bills payable for merchandise increased 250 per cent. Compared with the total amount of sales, which for 1918 was 789,549,000 marks (\$187,912,662, par), the item of 16,257,000 marks (\$3,869,166, par) for bills seems insignificant. It shows that the consumers' societies pay cash for nearly all their purchases.

The development of the movement of cooperative consumers' societies per 1,000 members during the period January 1, 1903, to January 1, 1918, is shown in the following table:

DEVELOPMENT OF CONSUMERS' SOCIETIES PER 1,000 MEMBERS, 1903 TO 1918.

[1 mark at par=23.8 cents.]

As concerns the composition of the membership of cooperative consumers' societies, no data are available for all societies combined, but below are given occupational statistics, for the year 1918, of the membership of the Central Federation of German Consumers' Societies, which may be considered representative.

OCCUPATIONAL STATISTICS OF THE MEMBERSHIP OF THE CENTRAL FEDERATION OF GERMAN CONSUMERS' SOCIETIES, 1918.

Occupational group.	Number.	Per cent.
Independent tradespeople.....	120,794	5.63
Independent farmers.....	45,889	2.13
Professional workers, State and municipal employees.....	98,555	4.59
Wage earners in industry.....	1,554,394	72.34
Wage earners in agriculture.....	45,485	2.11
No fixed occupation (pensioners, persons living on their income, etc.).....	283,739	13.20
Total membership.....	2,148,856	100.00
Male membership.....	1,683,019	78.32
Female membership.....	465,837	21.68

India.

THE cooperative movement in India dates from March 25, 1904, when the cooperative credit societies act was passed. The growth of the movement has, however, been rapid. In 1915 there were 17,327 cooperative societies, having 824,469 members, and capital to the amount of Rs. 89,661,722 (\$29,086,263). Since India is primarily agricultural it is not surprising that of the above number 15,861, or about 92 per cent, are agricultural credit associations. Even this number is inadequate, since there are in India 200,000,000 agriculturists to be financed. It is stated that by the aid of these associations "laborers have become owners; hopeless debt has been banished and the money lender driven out; agriculture and industry have been developed, and the villagers in the poorest tracts have become prosperous; the illiterate man has turned toward education and the drunkard has been reclaimed; the middleman has been eliminated, the raiyat is getting full value for his produce, and paying his rent with ease; village life has been stimulated by associated action and by the business education of the bank; punctuality, thrift, and mutual confidence are being taught; litigation has decreased and morality has improved; activity has taken the place of stagnation and routine; associated action has replaced mutual distrust."

Except for the credit societies, cooperation is still in the experimental stage.

The greatest obstacle to the growth of cooperation in India is stated to be the illiteracy of the people.

Bengal.—The year 1917-18 was a year of hardship for the cooperative societies of Bengal, owing to the extremely low prices obtained for jute and rice. In 1918-19, however, better prices were obtained for jute and the price of rice rose to "unprecedented heights."

In 1918-19 the number of cooperative societies in Bengal showed an increase of 615 over the previous year, and the membership increased 16,021 in the same time. A large increase in financial prosperity was shown by the societies, but this, it is pointed out, may have been partly due to the rise in the price of the rice and jute produced by members of the societies. One society, which in the year ending June 30, 1919, realized a "profit" of Rs. 300,000 (\$97,320, par), includes in its activities the operation of a purchase and sale society, a cattle insurance business and a demonstration farm, as well as educational activities, dispensing of medicine, relief work, and town improvement.

The table below shows the operations during 1918-19 of various classes of societies in Bengal:

OPERATIONS OF COOPERATIVE SOCIETIES IN BENGAL, INDIA, 1918-19, BY CLASS OF SOCIETY.

[1 rupee at par=32.44 cents.]

Class and society.	Number of societies.	Number of members.	Amount of business.	Share and working capital.	Reserve fund.	Profit.

Besides the societies shown in the table there are also 52 central cooperative banks having a working capital of Rs. 8,260,976 (\$2,679,861, par) and a provincial bank whose working capital is Rs. 1,963,069 (\$636,820, par).

Italy.

THE cooperative movement in Italy dates back to about 1854 when in order to mitigate the effects of a famine, the General Association of Workers at Turin organized a cooperative store. Ten years later the railway officials at Turin organized a consumers' association which had immediate success and soon was doing an annual business of over a million lire (\$193,000, par). About the same time (1864) a similar organization was formed by railway officials at Milan. Difference of opinion caused a division of the society into two societies, both of which still exist and rank among the most important societies in Italy.

The period 1870-1890 saw the formation of a number of cooperative agricultural societies, as well as productive societies formed by various occupational groups, such as printers, joiners, blacksmiths, shoemakers, masons, dockers, etc. Though many of these latter failed because of "their inability to conquer the individualist spirit of their members," enough were successful to demonstrate the feasibility of this form of cooperative enterprise.

The National Cooperative League was formed at the first National Congress, held at Milan in October, 1866. This league is composed of societies representing all types of cooperative effort. Since the formation of the league the number of affiliated societies has increased from 36 in 1866 to 3,000 in 1919.

It is stated that in the past few months the number of cooperative societies in Italy has grown to 10,000. The societies are small, however, the average membership being 150.

Figures collected by the Italian National Cooperative League show that the 7,249 societies for which information was obtained are divided, according to type of society, as follows:

Consumers' societies.....	3,814
Productive and labor societies.....	2,351
Agricultural societies.....	425
Miscellaneous societies.....	425
Federations of societies.....	234
Total.....	7,249

Fifty of the most important societies did a combined business of 280,000,000 lire (\$54,040,000, par) during 1918 and exceeded this figure in 1919. The Cooperative Union at Milan alone had a turnover of 70,000,000 lire (\$13,510,000, par), and the Cooperative Alliance at Turin, of 40,000,000 lire (\$7,720,000, par).

The labor societies form a special phase of the cooperative movement in Italy. These societies undertake contracts for work, which is performed by the members. It is reported that in some Provinces these cooperative societies have practically driven private contractors out of business. The cooperative labor societies of Reggio were given the work of constructing the Reggio-Crano Railway, and have for the last 10 years been responsible for its management.

Another distinctive feature of the Italian movement is the collective leaseholding societies organized generally for the purpose of finding employment for their members. Though, according to reports, these societies have not acquired sufficient land to provide continuous employment for their members, their work has resulted in a distinct improvement in this respect. The following statement shows the amount of land cultivated by the collective leaseholding societies in each Province:

	Acres.
Bergamo.....	2,189
Milan.....	2,241
Pavia.....	1,203
Parma.....	2,901
Reggio d'Emilia.....	3,571

Bologna.....	4,435
Ravenna.....	17,297
Ferrara.....	1,011
Sicily.....	70,137

Netherlands.

THE cooperative movement in the Netherlands had its beginning in 1837, when an agricultural cooperative association was formed in Groningen. Since that time the movement has expanded until its activities now cover a wide range. In the field of production are found cooperative creameries, sugar refineries, strawboard factories, potato-meal factories, associations for the purchase of live stock, feed, fertilizers, and implements, associations for the marketing of agricultural and horticultural products; in the field of banking there are farm-loan banks, savings, and mortgage banks; insurance is represented by hail, live stock, and various types of mutual life, fire, accident, and unemployment insurance; in addition there are the numerous and well-organized consumers' societies, the cooperative kitchens,

cooperative building associations, and cooperative associations of other forms.

It is stated that the first year of the war was a period of unprecedented prosperity for all types of cooperative societies in Holland. Thereafter, however, the societies suffered because of the Government rationing system which prevented the securing of adequate supplies, since supplies were regulated on a prewar basis, which of course took no account of the societies' greatly increased membership.

The following table shows the growth of the various types of cooperative societies in specified years from 1890 to 1917:

NUMBER OF SOCIETIES OF EACH TYPE IN THE NETHERLANDS, IN SPECIFIED YEARS, 1890 TO 1917.

The cooperative movement in the Netherlands has been characterized by a lack of unity between the producers' and consumers' organizations. Even the consumers' movement has been divided into three distinct federations—the Socialist League of Dutch Workmen's Cooperative Societies, the Roman Catholic Cooperative Union, and the so-called "neutral" Dutch Cooperative Union. The growth of each of these organizations since its formation is shown in the following table:

GROWTH OF DUTCH CONSUMERS' FEDERATIONS.

Organization and year.	Number of affiliated societies.	Number of members.
Dutch Cooperative Union:		
1897 ¹	16	7,110
1917.....	167	139,681

League of Dutch Workingmen's Cooperative Societies:		
1907 ¹	17	8,300
1917.....	42	42,449
1918.....	43	38,754
Roman Catholic Cooperative Union:		
1912 ¹	(²)	(²)
1917.....	81	(²)
1918.....	192	25,705

¹ Year of organization.² Not reported.

During the war, circumstances led to the organization of a central committee, formed of representatives of each of the federations, to protect the interests of cooperators. Apparently the advantages of joint action were demonstrated, for it is now reported that two of the federations, the League of Dutch Workingmen's Cooperative Societies, and the Dutch Cooperative Union, have decided to amalgamate to form a new body, which will be called the Central Union of Dutch Distributive Societies. The aim of this new union will be: (1) the organization of Dutch consumers' societies for the safeguarding of their common interests; (2) the furtherance and protection of the interests of the consumers; (3) the spread of the cooperative movement for the advancement of purchase in common and of cooperative production; and (4) the furtherance of the knowledge of the cooperative movement.

Some degree of unity had been previously attained in purchasing, through the Cooperative Wholesale Society which, though organized as the joint purchasing agency for the stores of the Eigen Hulp Society, undertook the function of wholesale purchasing for the Dutch Cooperative Union, on the organization of that body in 1890. In 1915 it became a separate organization; it was thus enabled to receive into membership societies affiliated with the three federations mentioned above. A number of independent societies have also become members of the wholesale society.

Until the separation of the two bodies on September 26, 1914, the membership of the wholesale society was identical with that of the Dutch Cooperative Union. Its development since that time is shown in the following table:

OPERATIONS OF THE DUTCH COOPERATIVE WHOLESALE SOCIETY, 1915 to 1918.

Year.	Number of affiliated societies.	Number of members.	Amount of business.	Net savings.
1915.....	132	94,320	\$2,506,910	23,597
1916.....	158	111,214	3,608,876	30,887
1917.....	228	143,766	4,020,120	46,974
1918.....	284	168,370	¹ 2,917,063	(²)

¹ 11 months.² Figures not yet available.

The wholesale society operates production departments which roast coffee, grind spices, mix tea, and manufacture soap, wooden shoes, and flour. In cooperation with a society in Rotterdam it maintains a chemical laboratory for the analysis of foods. In 1914 it established a meat-packing plant which, however, it was forced to discontinue in 1918 because of the scarcity of meat and the government restrictions on slaughtering.

In 1917 it employed 118 persons, whose wages are regulated by collective agreement between the societies and the employees.

Norway.

IN NORWAY, as in other countries, at the outbreak of the war, the cooperative organizations had at their disposal sufficient supplies to prevent a sudden and extreme rise in prices. As the war progressed, however, a growing shortage of goods and the Government's participation in trade created difficulties for the societies, particularly the wholesale society. Eventually the formation of new retail societies had to be discouraged by the wholesale organization since it was impossible to furnish them with supplies. In spite of this fact, however, the figures of the Norwegian Cooperative Wholesale Society show progress even though the increase in sales is largely due to high prices.

The following table shows the development of the Norwegian Cooperative Union during the war period:

OPERATIONS OF THE NORWEGIAN COOPERATIVE UNION, 1914 TO 1918.

[1 krone at par=26.8 cents.]

Year.	Number of affiliated societies.	Number of members.	Amount of business.

Roumania.

THE first manifestation of the cooperative spirit in Roumania appeared in the founding of a "people's bank" in 1894. All other forms of cooperative enterprise since developed are in the nature of offshoots from these banks. By 1903 the number of these banks had reached 700, the membership had risen to 59,844, and the capital to 4,250,600 francs (\$820,366, par). In that year a central bank and clearing house, the Casa Centrala, was formed, which now acts as the central credit institution of the whole peasant cooperative system.

In 1918 this central bank, with its 3,170 member banks, formed a network covering the entire country. This system of banks represented 645,000 stockholders, divided, according to occupation, approximately as follows: 600,000 were peasants, 10,000 were mer-

chants, 5,000 were school-teachers, 4,000 were priests, and 26,000 were workers in miscellaneous occupations.

Under a system which had grown up, in many districts the cultivatable land was practically monopolized by speculators who leased the land from the owners and either re-leased it or worked it with peasant labor at wages fixed by themselves. The peasant thus had no choice in the matter of employment or wages.

This situation was remedied to some extent by the laws of 1905 and 1907. The first legalized the formation of peasant cooperative lease-holding societies, and the second, in order to make land available to the peasant, authorized the purchase of the large estates by the communes. Though the latter law was defective, in that owners of large estates were not compelled to sell, yet under its provisions 109 estates amounting to 127,292 hectares (314,539 acres) were purchased between 1908 and 1915, of which 20,000 hectares (49,420 acres) were sold to peasants and the remainder rented to them.

The peasant cooperative land-leasing associations formed under the law of 1905 showed "an astonishing ability" to compete with the speculators. They made a practice of hiring experts to advise them with regard to rotation of crops, choice of seeds, etc. As a result of their systematic efforts toward improvement of agricultural methods, the average yield in the best years of the land taken over by these societies has been doubled.

During the war period, and particularly after Roumania entered the war in 1916, the peasants became accustomed to cooperative effort along numerous lines and on a large scale. Under the abnormal conditions caused by the war the Government was obliged to regulate trade and take charge of the provisioning of the people. In the villages only the cooperative associations were found to be capable of performing this function, and the people's banks, the most uniform and best organized of the cooperative organizations, were placed in charge. Only through them were the people able to obtain food and carry on exchange of products. During the period October, 1916, to March, 1918, through the medium of the banks, merchandise to the value of over 14,500,000 francs (\$2,798,500, par) was supplied to the peasants and produce worth 7,000,000 francs (\$1,351,000, par) was sold.

Cooperative production has been at a great disadvantage. It is stated that the industrial enterprises with which the cooperative productive associations compete enjoy exemption from duty on raw materials, special rates on the Government railways, and various other privileges which were not until recently accorded to the cooperative societies.

The consumers' cooperative associations have been "held within small compass by the simplicity of peasant life and the fact that the peasants produce nearly everything they use."

The following table shows the growth of the various types of cooperative societies in Roumania during the period 1908 to 1916, the latest year for which figures are available:

NUMBER OF COOPERATIVE ASSOCIATIONS IN ROUMANIA, NUMBER OF MEMBERS, AND AMOUNT OF CAPITAL AND RESERVE, 1908, 1912, AND 1916, BY TYPE OF ASSOCIATION.

[1 franc at par=19.3 cents.]

¹ This total is not the exact sum of the items but is as given in the report.

An interesting development has been taking place since December, 1918, when two decree laws provided for the expropriation of all cultivatable crown and institutional lands, all lands of subjects of foreign birth, and all rural lands belonging to absentees. In addition 2,000,000 hectares (4,942,000 acres) were expropriated from private estates of over 100 hectares (247 acres) of cultivatable land. The law of December 31, 1918, reorganized the central cooperative bank, the Casa Centrala, and gave it charge of the sale of the expropriated land to the peasants. It is stated that while great practical difficulties were encountered, expropriation was practically complete by June, 1919.

Other laws, enacted shortly after the expropriation acts, turned over to the cooperative associations the exploitation of the forests and the promotion of the creation of communal pastures.

One of the leaders in the Roumanian cooperative movement is quoted as saying: "We believe that before long the entire production of the villages will flow through the cooperatives." Where community production will leave off and strictly private enterprise begins, is stated to be impossible of prediction. Already the two are in conflict. Because the first-rate men found it more profitable to work for themselves, the cooperatives have, it is said, had to employ men who failed in their own ventures. According to the report, there are, however, those who are of the opinion that the development of cooperative effort will eliminate private capitalistic enterprise by "open competition."

Sweden.

THE founding of distributive societies in Sweden began during the period 1860-1870, about the same time as in Denmark, but the development of the societies was very gradual, and did not quicken until about the beginning of the present century. In 1899,

a central organization, the Cooperative Union, was founded, in which were federated various types of cooperative societies. At first the union was purely a propagandist organization. In 1904, however, it established the Cooperative Wholesale Society. With the establishment of the wholesale society the membership grew rapidly until at the end of 1918 there were 849 societies affiliated with the union.

In 1908, the union opened a savings bank which has made rapid progress. In the same year the union decided to limit membership to those societies which require cash payment, and in 1911, the wholesale society ceased the supply of goods to nonmembers.

The progress of the union during the war is shown in the following table:

DEVELOPMENT OF SWEDISH COOPERATIVE UNION DURING THE PERIOD 1914 TO 1918.

[1 krone at par=26.8 cents.]

Year.	Number of societies affiliated.	Number of societies reporting.	Membership of reporting societies.	Amount of business.
				<i>Kroner.</i>

Profit Sharing and Labor Copartnership in the United Kingdom.

THE British Ministry of Labor has recently issued a report on profit sharing and labor copartnership in the United Kingdom,¹ which states that the number of schemes which were in existence October 31, 1919, so far as reported to the ministry, was 182, the number of persons employed by the firms having these schemes being about a quarter of a million. These 182 schemes, it is added, were the survivors of 380 schemes which had been started at one time or another since the year 1865. It seems that the

¹ Great Britain. Ministry of Labor. Report on profit sharing and copartnership in the United Kingdom. London, 1920. 244 pp.

greatest activity in the formation of profit-sharing schemes was shown in the four years from 1889 to 1892.

The report suggests that the abandonment of the schemes which have ceased to exist has been caused by inability of the firms to earn sufficient profit to make profit sharing a success, or to some other cause independent of the profit-sharing scheme rather than to any defects inherent in the system itself, or to the dissatisfaction of employers or of the employees. Ninety-one out of 198 cases of abandonment are attributed to this last cause.

While in every year a number of firms are unable to pay any bonus at all, still it is estimated that, taking all the schemes into consideration, the average bonus over a long series of years is about 5 or 6 per cent. The average ratio of bonus to wages, covering the years 1901 to 1918, taking into account both the number who actually participated and the number who would have been entitled to participate in cases where the bonus was nil, is given as 5.5 per cent.

The number of participating employees, the total amount of bonus paid, and the average bonus per employee, by industry group, for the year 1918, are shown in the following table.

NUMBER OF SCHEMES, NUMBER OF EMPLOYEES AFFECTED, AND TOTAL AND AVERAGE AMOUNT OF BONUS PAID, BY INDUSTRY GROUP, IN 1918.

[1£ at par=\$4.8665.]

Industry group.	Number of schemes.	Number of employees participating (or entitled to participate).	Total amount of bonus.	Average bonus per employee.
			£	£ s. d.
Chemicals, oils, etc.....	5	2,393	30,509	12 15 0
Food and drink.....	10	3,622	43,396	11 19 7
Gas.....	31	22,447	24,985	1 2 3
Engineering, etc.....	6	15,004	34,415	2 5 10
Printing, etc.....	10	3,870	29,461	7 12 3
Textile.....	9	5,784	52,254	9 0 8
Merchants, etc.....	15	6,959	67,817	9 14 11
Insurance, etc.....	1	18,500	None.	None.
All other.....	18	3,254	16,891	5 3 10
Total.....	105	81,833	299,728	3 13 3

The report states that if employees in firms which distributed no bonus be excluded, the total number of actual participants in the schemes for which particulars can be given was 52,056, and the average bonus was £5 15s. 2d. (\$27.99, par).

The report gives the rules of a number of schemes of profit sharing or copartnership.

EMPLOYMENT AND UNEMPLOYMENT.

Employment in Selected Industries, April, 1920.

THE Bureau of Labor Statistics received and tabulated reports concerning the volume of employment in April, 1920, from representative establishments in 13 manufacturing industries. Comparing the figures of April, 1920, with those of identical establishments for April, 1919, it appears that in 11 industries there was an increase in the number of persons employed, while in 2 there was a decrease. The largest increase, 58.7 per cent, is shown in men's ready-made clothing, and the decreases, 5.8 and 4.6 per cent, appear in car building and repairing and in cigar manufacturing, respectively.

All of the 13 industries show an increase in the total amount of the pay roll for April, 1920, as compared with April, 1919. The most important percentage increases, 151.2, 90.7, and 81.1, appear in men's ready-made clothing, woolen, and hosiery and underwear, respectively. The big increases over last year's figures are due in part to a rise in volume of employment and in part to a recovery from the decline last year.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN APRIL, 1919,
AND APRIL, 1920.

Industry.	Estab- lish- ments report- ing for April, both years.	Period of pay roll.	Number on pay roll.			Amount of pay roll.

Comparative data for April, 1920, and March, 1920, appear in the following table. The figures show that in 6 industries there was an increase in the number of persons on the pay roll in April as compared with March and in 7 a decrease.

The largest increases in the number of people employed appear in car building and repairing, 4.2 per cent; and men's ready-made cloth-

ing, 2.8 per cent. Percentage decreases of 3.4 and 2.3 appear in leather manufacturing and cotton finishing, while both automobile manufacturing and boots and shoes show a decrease of 1.7 per cent.

In comparing April, 1920, with March of this year, 5 industries show an increase in the amount of money paid to employees and 8 a decrease. The most important increase is one of 4.9 per cent in hosiery and underwear, while car building and repairing shows an increase of 1.1 per cent. The greatest decreases are 5.9 per cent in iron and steel, 4.7 per cent in cigar manufacturing, 4 per cent in leather manufacturing, and 3.9 per cent in automobile manufacturing. April production was somewhat curtailed because of the railroad strike.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN MARCH AND APRIL, 1920.

Industry.	Establishments reporting for March and April.	Period of pay roll.	Number on pay roll.			Amount of pay roll.

¹An increase of less than one-tenth of 1 per cent.

In addition to the data presented in the above tables as to the number of employees on the pay roll, 87 plants in the iron and steel industry reported 132,771 employees as actually working on the last full day of the pay period reported for April, 1920, as against 123,867 for the reported pay-roll period in April, 1919, an increase of 7.2 per cent. Figures given by 98 establishments in the iron and steel industry for April, 1920, and March, 1920, show that 141,361 employees were actually working on the last full day of the pay period reported for in April, 1920, as against 142,763 for the period in March, 1920, a decrease of 1 per cent.

Changes in Wage Rates.

DURING the period March 15 to April 15, 1920, there were increases in wages made by establishments in all of the 13 industries. Of the establishments reporting, many did not answer the inquiry relative to this item, but in such cases it is not likely that changes were made.

Iron and steel.—Two establishments reported an increase of 10 per cent affecting 67 per cent of the employees in one and 12 per cent of the employees in the other. About 9 per cent of the force in one plant received an increase of about 6 per cent. Forty-five per cent of the men in one concern were increased 75 cents per day.

Automobile manufacturing.—One establishment gave an increase of 25 per cent to 75 per cent of the employees. Fifteen per cent of the men in one plant received an increase of 9.5 per cent. An increase of 5 per cent, affecting 36 per cent of employees, was reported by one concern. One establishment gave an increase of 2.2 per cent to 38 per cent of the force while another establishment gave an increase of 2 per cent to 4 per cent of the force.

Car building and repairing.—An increase of 15 per cent, affecting 20 per cent of the force was reported by one firm. One establishment gave an increase of 7 per cent to 8 per cent of the employees, while another establishment granted an increase of 2.9 per cent to 20 per cent of the foundry men.

Cotton manufacturing.—Two firms gave an increase of 10 per cent, affecting all employees in one firm, while the other firm did not state the number of employees affected. The entire force in two mills were given an increase of 8 per cent. All of the men in one establishment received an increase of about 5 per cent.

Cotton finishing.—An increase of 15 per cent, affecting 8 per cent of the employees, was reported by one establishment.

Hosiery and underwear.—One establishment reported an increase of 15 per cent but made no further statement. All of the employees in one mill were given an increase of 10 per cent, while 75 per cent of the employees in another mill received an increase of 5 per cent.

Woolen.—All of the employees in one establishment received an increase of 8 per cent.

Silk.—One firm granted an increase of 7.8 per cent, affecting 15 per cent of the employees while another firm gave an increase of 7 per cent affecting 22 per cent of the employees. About 9 per cent of the men in one establishment received an increase of about 6 per cent. All of the pieceworkers in one concern were increased 5 cents per hour.

Men's ready-made clothing.—One establishment gave an increase of 20 per cent to part of its employees.

Leather.—All of the employees in one establishment received an increase of 12 per cent while the entire force in another establishment were given an increase of 10 per cent. Ten per cent of the men in one concern received an increase of 6 per cent. One firm reported a general increase but made no further statement. All of the full-time workers in one establishment received a bonus.

Boots and shoes.—Two factories granted a 10 per cent increase affecting 6 per cent of the employees in one of the factories and 5 per cent of the men in the other. An increase of 8.8 per cent, affecting 4.5 per cent of the force was reported by one concern. Three plants gave an increase of 5 per cent, affecting 10 per cent of the force in one establishment, 8 per cent of the force in the second establishment, and 4 per cent of the force in the third establishment. One firm reported an increase, but made no further statement.

Paper making.—One establishment reported an increase of 25 per cent, affecting 7 per cent of the employees, while another establishment reported increases ranging from $12\frac{1}{2}$ to 22 per cent, but made no further statement. The entire force in one firm received an increase of about 14 per cent. All the men in one concern received an increase of $12\frac{1}{2}$ per cent, while the entire force in another concern received an increase of 12 per cent. One firm reported an increase of about 12 per cent, affecting about 17 per cent of the employees. All employees in three establishments were given an increase of 10 per cent. Fifty per cent of the force in one concern received an increase of 9 per cent. Two mills gave an increase of about 8 per cent, affecting 20 per cent of the employees in one mill and 18 per cent of the employees in the other. An increase of 7.4 per cent, affecting 37 per cent of the employees, was reported by one establishment, while 70 per cent of the employees in another establishment received an increase of 7 per cent. One firm that reported a general advance of wages made no further statement.

Cigar manufacturing.—All of the employees in one establishment received an increase of $16\frac{2}{3}$ per cent. One establishment gave increases ranging from 10 to 15 per cent, affecting 70 per cent of the employees. Two firms reported an increase of 10 per cent, affecting 53 per cent of the employees in one firm and 40 per cent of the employees in the other. All of the employees in one establishment were given an increase of 7.5 per cent, while the entire force in two establishments were given an increase of about 5 per cent. Ninety per cent of the men in one concern received an increase of 4.5 per cent. One establishment reported an increase of 10 per cent but did not state the per cent of employees affected. The factory workers in one plant received a bonus.

Changes in Volume of Employment in Representative Bituminous Coal Mines.

RECENTLY the Bureau has undertaken to increase gradually the number of industries from which to collect information concerning changes in employment from month to month.

One of the most important basic industries is that of coal mining; hence this industry was selected for addition to the list of 13 industries that have been covered for some time. Questionnaires were sent out and a sufficient number of returns have been received from bituminous coal-mine operators to warrant the publication of the material collected.

These figures, collected in large volume month after month, afford a barometer of industrial conditions of value to operators, manufacturers, merchants, and the general public. The information collected is published with the hope that more operators, both of anthracite and bituminous coal mines, will cooperate in this monthly collection and compilation of employment figures.

CHANGES IN VOLUME OF EMPLOYMENT IN REPRESENTATIVE BITUMINOUS COAL MINES, 1919, AND JANUARY TO APRIL, 1920.

¹ Because of the strike some mines were idle and others running with a small force; hence no figures are shown for these months.

INDUSTRIAL ACCIDENTS.

Influence of the War on Accident Rates in the Iron and Steel Industry, 1914-1919.¹

By LUCIAN W. CHANEY.

FOR a very long time to come the question of influence of the World War upon our social and industrial life will be a subject of earnest debate.

It is accordingly appropriate to devote this article to presenting some illustrations which seem most clearly to indicate the result which war conditions have tended to produce upon accident rates.

The first case to be considered is that of a group of mills which have been combined because they afford opportunity both to determine severity rates and to examine the movement of such rates in considerable detail. These mills are largely devoted to the fundamental departments of the industry, namely, blast furnaces, steel works, and rolling mills. They employed in the years covered (1914 to 1919) men varying in number from 35,000 to 50,000. The size of the group is accordingly sufficient to assume that the results obtained are fairly typical.

A chart will first be considered, in which are shown from month to month over the six years the fluctuations of four items, namely, employment, frequency of nondisabling accident, frequency of disabling accident, and severity of disabling accident. The figures of each group are reduced to index numbers on the basis of January, 1914, as 100. They are then plotted on a percentage scale which shows the per cent of increase or decrease from month to month.

It is desirable before proceeding with discussion of the features of this chart to emphasize one point which is brought out by it. That is the accidental character of accidents. Even in a group of employees as large as the present one it will be found that general conclusions which seem to be fully warranted are flatly contradicted by a great number of special cases. Accidents in their very nature depend on combinations of circumstances which might never occur twice. It is the unexpected which gives character to accidental happenings. This is true in some measure of all types of accidents, but particularly is it true of those which involve death or serious injury. It would be expected therefore that just such fluctuations as those recorded between the months would occur. The fact that there is not the same regularity as that found in other statistical fields does not in the least imply imperfection in the basic data nor error in the treatment.

¹ This article is from a bulletin on Causes and prevention of accidents in the iron and steel industry, now in preparation by the Bureau of Labor Statistics.

If employment be considered it will become evident that it proceeded on a fairly level keel during the first eight months of 1914. It is known from other sources of information that this was a considerably lower level than for the year 1913, which was a year of particularly high activity in the industry. There is then a further decline from which recovery begins with 1915. This increase continues with some unsteadiness until a maximum is reached in the month of

CHART A.—FLUCTUATIONS FROM MONTH TO MONTH OF SEVERITY RATES, OF FREQUENCY RATES FOR DISABLING AND NONDISABLING ACCIDENTS, AND OF EMPLOYMENT, 1914 TO 1919.

January, 1919. From that point there is a general tendency to decline.

Turning now to nondisabling accidents, it will appear that while they are doubtless influenced by the changes in employment they are more responsive to other and more obscure factors. When employment is at the lowest point this class of accidents is also at a low point. From January, 1915, there is an irregular rise, more rapid than the rise in employment, until August, 1916, from which there is a decline with some upward movements in each year.

The frequency of disabling accidents runs a somewhat similar course but nowhere departs so widely from January, 1914, as do nondisabling accidents. The high month is August, 1916, from which point there is an irregular decline.

The severity of disabling accidents is much more irregular from month to month and nowhere reaches a level as high as that of Jan-

uary, 1914. The high months are August and November, 1916, February, March, and August, 1918, and July, 1919. This irregularity and the frequent departure from the showing regarding frequency is entirely normal in view of the fact that the comparatively small number of deaths have a controlling influence on the severity rates and the deaths are not distributed regularly.

Chart A shows the percentage variations which occur from month to month. It is desirable to present the same data in a form in which

CHART B.—TREND OF SEVERITY RATES, OF FREQUENCY RATES FOR DISABLING ACCIDENTS, OF FREQUENCY RATES FOR NONDISABLING ACCIDENTS, AND OF EMPLOYMENT, 1914 TO 1919.

the irregularities are "smoothed" and the general trend of events made evident without the confusion due to temporary conditions.

In Chart B the rates are cast up for the years ending with each month, beginning with December, 1914. Each point in the curves resulting from plotting these values therefore represents an entire year and the irregularities seen in Chart A are in a measure eliminated.

A study of Chart B reveals that there was a slight downward trend in employment during the early portion, accompanied by downward movements in each of the three accident curves. This was most pronounced in severity of disabling accident, less so in frequency of disabling cases, and least in nondisabling cases.

Then, from the year ending June, 1915, to that ending June, 1916, employment was rapidly increasing. Each of the accident curves rises with the employment curve, the three pursuing nearly parallel courses, and both frequency curves rising more rapidly than the employment curve. It is known from other studies of the situation that this upward movement in employment involved a high accession rate of men new to the business. The huge demand for steel, which came with the opening of the war, led to taking on any man who offered himself and seemed capable for the physical demands of the task. Such a high accession rate of inexperienced men is always accompanied by increasing accident rates.

From the year ending June, 1916, to that ending January, 1917, the rise in employment continued, but at a less rapid rate. The proportion of inexperienced men introduced is known to be markedly less. The accident curves rise to this point but show the influence of the slackening in accessions. From the year ending January, 1917, the employment curve continues to rise quite steadily but the accident curves begin to decline. In the case of nondisabling and disabling frequency this decline continues to the calendar year 1919.

In the severity curve there appears a striking disagreement with the trend of frequency. While frequency is falling from the year ending January, 1918, severity rises to the year ending December, 1918. From that point irregular decline occurs to the end of 1919.

Chart A presents the fluctuations from month to month and Chart B the general trend over the six years. With this picture in mind it is possible to consider the possible relations of these several curves to war conditions and to suggest some explanations of the phenomena.

It may first be noted that the records embodied in the charts do not go back quite far enough to give all the desirable information. Periods of high industrial activity are necessarily those in which accident rates will tend to rise. During the period from 1906 onward there have been three conspicuous periods of this kind. They are approximately 1906-7, 1912-13, 1916-1918. The death rates per 1,000,000 hours worked, in the mills under consideration, have been since 1910 as follows: 1910, 0.70; 1911, 0.60; 1912, 0.63; 1913, 0.67; 1914, 0.47; 1915, 0.37; 1916, 0.50; 1917, 0.40; 1918, 0.53; 1919, 0.40. It will be observed that these figures have high points in 1910, 1913, and 1918, with depressed intervals between. The important point to be noted is that the prewar high point of 1913 is higher than the war high point of 1918, the proportion being 67 to 53; that is to say, the tendency to rising rates which war conditions brought about was either opposed by more effective safety measures or was intrinsically less than that existing in the prewar period. It may fairly be urged that the explanation is to be found in the improved construction of the new buildings and machinery which were installed in response to the war demand and in the active efforts put forth in training and introducing the new man who had to be employed.

A considerable number of industrial concerns took the position that the demands of war production were so imperative that they were perfectly justified in relaxing attention to safety measures of all sorts. The result is reflected in the increased accident occurrence registered by most agencies. Whether or not this increase brought the rates

generally above the prewar standard is a matter which can not be determined with certainty. It is to the great and lasting credit of the iron and steel industry that it did meet the situation directly and endeavored to combat the inevitable tendency by increased efforts. The final outcome of these various efforts was first to check the rising accident rates and finally to bring them down to points lower than the prewar level.

It is now pertinent to examine the contradiction noted above between the indications afforded by the frequency rates and severity rates for the years ending in the months of 1918. In this portion of the charts, frequency rates both for disabling and nondisabling accidents show a tendency to decline while severity is rising. This condition is of interest from several standpoints. It has often been noted that frequency and severity rates give these opposite indications; indeed, this fact was the moving reason for working out the system of severity rates. It is not often, however, that the contradiction is as pronounced and long continued as in this case. It is clear that the efforts of one sort and another which kept severity below the rate of 1913 and produced a marked decline of frequency after 1916 were after all not so well adapted to meet the severity problem as they were to deal with the problem of minor injury. Severity, it is true, did decline for a time concurrently with frequency but then took a turn in the opposite direction, which continued until the close of the calendar year 1918. From that point the curve again concurs with that of frequency. The extent to which minor injury was controlled in 1918 and the failure equally well to control the severer forms is strikingly brought out by contrasting the years 1915 and 1918, as is done in the following table:

FREQUENCY AND SEVERITY RATES FOR THE MONTHS OF 1915 AND 1918.

Month.	Frequency rates (per 1,000,000 hours exposure).		Severity rates (per 1,000 hours exposure).		Month.	Frequency rates (per 1,000,000 hours exposure).		Severity rates (per 1,000 hours exposure).	
	1915	1918	1915	1918		1915	1918	1915	1918
January.....	32.4	45.7	1.4	4.5	August.....	61.5	41.6	4.2	5.3
February.....	33.3	37.8	3.6	5.6	September.....	62.1	35.7	4.0	3.4
March.....	39.7	44.6	2.6	5.6	October.....	63.9	32.5	3.0	1.7
April.....	44.1	41.5	2.8	4.1	November.....	57.3	31.6	4.5	5.0
May.....	53.3	43.5	.6	3.9	December.....	57.8	31.5	3.6	4.0
June.....	59.3	41.0	4.3	3.9					
July.....	62.7	40.5	1.2	3.1	Total.....	53.2	38.8	3.0	4.1

Inspection of this table will disclose that 9 of the 12 months of 1915 have higher frequency rates than the same months of 1918. On the contrary, 1918 shows higher severity in 9 of the 12 months. Evidently the conditions of the two years were in some way distinctly different. Superficially the differences appear to be that 1915 was a year of rapid changes in the working force and that 1918 was one of relative stability of the workers but of intense industrial activity. In the first condition it is clear that all accident rates tend to rise rapidly. It is the uniform experience that whenever the accession of inexperience is increasing the accident rates tend

strongly to go up, and will do so unless very rigorous measures are taken in opposition.

A reasonable explanation of the rising severity of the years ending in 1918 is much less easy. The greater industrial activity of that year must have had its influence, but knowledge of the plants does not seem to justify placing any great stress upon that factor. The operations of such mills as are here grouped are necessarily of a rather leisurely character and can not in the nature of the case be hurried sufficiently to increase greatly the hazard of the individual man.

It has been suggested that the "flu" epidemic may have so influenced the physical condition of the men that they were more liable to accidental injury. This can scarcely be given great weight, since, though the severity rate of the months when "flu" was most prevalent is higher than the average, it is not higher than that in several other groups of months in which there was no "flu" complication.

This process of exclusion rather forces the conclusion that this is another case where the operators of these mills were led into a mistaken sense of security by the steadily falling frequency rates and so did not maintain full and rigorous attention to the causes of more severe injury. At all events it may be said that without constant attention to the severity rate it is impossible to have an accurate idea of the conditions which must be met.

The rates which form the basis of the foregoing charts and discussion are given in the following tables:

ACCIDENT RATES, BY MONTHS, 1914 TO 1919.

Month.	1914	1915	1916	1917	1918	1919

Departments of the Industry Manufacturing Various Products.

THE foregoing discussion illustrates the trend of accident rates in the basic departments of the industry. It will be of interest to determine whether the same forces were at work in other departments and to what extent the results were the same.

The plants for which it is possible to follow the details of war-time experience employed during the seven years which are covered a number of men varying from 110,000 to 186,000. The groups into which this total will be analyzed in seeking to determine the war-time experience in manufacturing various products are sufficiently

large to afford reasonable confidence that they represent typical conditions.

Chart C exhibits the trend of employment and of accident frequency rates in the entire group of plants from the year ending December, 1913, to that ending December, 1919.

The year 1913 as before noted was one of high industrial activity. Both in that particular and in the matter of accident rates the year formed a peak in the curves representing conditions. Following 1913 employment declined to the year ending May, 1915, and accident

CHART C.—TREND OF FREQUENCY RATES AND OF EMPLOYMENT FOR THE IRON AND STEEL INDUSTRY, 1913 TO 1919.

rates to the year ending July, 1915. Employment was increasing from that year until that ending November, 1917. A decline then began which was still in progress in the year ending December, 1919. Accident frequency increased from the year ending July, 1915, to the year ending August, 1916, and then while employment was still rising began to decline and continued so to do to the year ending December, 1919. It will be seen that this was in substantial agreement with what happened in the smaller group already considered.

The component parts of this total are presented in Chart D. It presents two groups of mills which produce miscellaneous steel products and one group of mills producing sheets and tin plate, wire products, tubes, and fabricated products.

Five of the six show a declining accident frequency to a year ending in some month about the middle of 1915. The sheet mills are unique among these production groups in that they show a declining accident frequency with only minor irregularities from the year ending December, 1913, to the year ending December, 1919. The other five groups have a rising frequency rate from a year ending near the middle of 1915 to a year ending with some month in 1916, varying from March to December. From that point there is a

CHART D.—TREND OF FREQUENCY RATES IN THE MANUFACTURE OF SPECIFIED PRODUCTS, 1913 TO 1919.

continuous, though not perfectly regular, decline to the year ending December, 1919, except in one case. One of the two groups which produce miscellaneous steel products has a second low point in the year ending February, 1918, from which a rise occurs until the year ending January, 1919. The second peak is slightly higher than the first.

It is evident that in all essential particulars the experience of these diverse production groups is the same as that in the fundamental departments. The rate tables on which the charts are founded follow.

FREQUENCY RATES PER 1,000,000 HOURS EXPOSURE FOR SPECIFIED PRODUCTS.

June, 1917.....	10,110	25,504	32,928	24,880	49,893	27,045	182,587
June, 1918.....	10,349	25,939	30,393	23,787	50,803	24,289	180,204
June, 1919.....	9,904	22,685	29,324	23,871	50,652	26,906	176,867

Fluctuation in Rates for Causes.

IT HAS been shown that certain very definite characteristics can be traced in the curves which represent the trend of accident rates over the war period. It is possible to examine the situation from another point of view. If the rates for the various causes be determined it will be possible to observe whether the indications from the groupings already presented are repeated in the various cause groups.

The following table shows the main cause groups:

ACCIDENT FREQUENCY RATES PER 1,000,000 HOURS EXPOSURE, IN THE IRON AND
STEEL INDUSTRY, BY CAUSES.

Cause.	1913	1914	1915	1916	1917	1918	1919
Working machines.....	3.8	2.7	2.6	2.6	2.0	1.8	1.4
Cranes.....	3.5	2.3	2.3	2.8	2.5	2.2	1.9
Vehicles.....	2.3	1.9	1.6	1.7	1.7	1.3	1.2
Hot substances.....	5.4	3.6	3.7	4.5	3.6	3.0	2.8
Falls of person.....	4.5	4.1	3.5	3.7	3.2	2.8	2.8
Falling material, not otherwise specified.....	1.2	.7	.7	.6	.4	.3	.4
Handling tools and material.....	26.7	19.4	20.6	21.5	15.7	12.8	11.7
Other causes.....	12.9	8.8	6.5	7.0	5.4	4.6	4.1
Total, all causes.....	60.3	43.5	41.5	44.4	34.5	28.8	26.3

It will be found that in practically all the cause groups there is a decrease after 1913 into the years 1914 and 1915, followed by increase to a peak in 1916, followed by further decline. The handling of tools and material produces more accidents than any other single group of causes. The rates per 1,000,000 hours exposure for each year beginning with 1913 are 26.7, 19.4, 20.6, 21.5, 15.7, 12.8, and 11.7. Inspection of this series discloses the characteristic high point in 1916.

It is possible to recapitulate and summarize the facts of the war period and the explanations which may be offered of the course of events. It may be noted that—

1. Whatever form of classification is used (the fundamental departments, production groups, or cause groups) the same trend is shown.

2. The period just prior to the war was a period of industrial decline. Employment went down, "labor mobility" almost ceased. Accident rates dropped more rapidly than employment.

3. As soon as the effect of European war orders began to be felt in this country employment began to increase. The accession of inexperienced men increased even more rapidly. Accident rates went up.

4. The iron and steel industry was alarmed by the increasing accident occurrence and undertook a strenuous counter campaign.

5. This was very successful in controlling and finally causing a decline in minor injury.

6. Major injury was not controlled so perfectly but was prevented from rising above the level of 1913 and was finally considerably reduced.

This review of the war period strongly supports the contention that even in the most strenuous times it is possible to hold in check the tendency to rising accident rates by the application of the three cardinal methods of the safety movement: (1) Adequate instruction of the men in skillful methods of work; (2) careful supervision of the well-instructed men; (3) "engineering revision," by which the safety of work places is increased.

Coal-Mine Accidents in the United States in Six Months Ending January, 1920.

ACCORDING to a statement recently issued by the United States Bureau of Mines, there was a gratifying decrease in the number of men killed in the coal mines of the United States during the six months ending January, 1920, as compared to the quantity of coal produced.

During July last year, when 221 men lost their lives, the production of coal was over 50,000,000 tons. In January, 1920, the production had increased to 56,000,000 tons, or 12 per cent, while the fatalities, instead of increasing proportionately, actually decreased to 188, or nearly 15 per cent. Nor is this decrease a mere accident or coincidence peculiar to the month of January, as may be seen from the following table:

PRODUCTION OF COAL, NUMBER OF FATALITIES, AND FATALITIES PER MILLION TONS MINED, IN COAL MINES OF UNITED STATES, JULY, 1919, TO FEBRUARY, 1920.

Month.	Production (short tons).	Men killed.	Number killed per million tons.
July, 1919.....	50,501,000	221	4.33
August, 1919.....	50,805,000	223	4.39
September, 1919.....	54,735,000	179	3.27
October, 1919.....	54,702,000	243	3.76
November, 1919.....	26,389,000	94	3.56
December, 1919.....	44,527,000	169	3.80
January, 1920.....	55,043,000	188	3.35

From the figures shown above it may be observed that the average monthly production for January and the five months immediately preceding was 49,500,000, or only 2 per cent below that for July, while the average number of men killed was 183, or a decrease of over 17 per cent.

The month of July, 1919, has been used as the base for this comparison because it is fairly representative of the average number of men killed each month since 1911. It will be noted that during the six months ending with January, 1920, the accidents have by no means kept pace with the increasing production of coal, and that during the coal strike last November the decline in the output of coal was accompanied by an even greater decline in the number of lives lost.

Metal-Mine Accidents in the United States During 1918.

THE RECENT report of the United States Bureau of Mines on Metal-mine accidents in the United States during the calendar year 1918 (Technical Paper 252) opens with the statement that the returns for the year show the lowest fatality rate recorded since the bureau began the collection of accident statistics in 1911, and that the number of nonfatal injuries was slightly less than in 1917 in spite of war conditions and labor shortage. Reports from 3,636 operators (about 1,000 less than in 1917) give a total of 182,606 employees as compared with 200,579 in 1917. In addition, the metallurgical works (not including iron and steel) reported 79,752 men in 1918 as compared with 84,042 in 1917.

There were 646 fatalities in metal mines in 1918; in 1917 there were 852. The fatality rate in 1918 is 3.57 per 1,000 300-day workers as compared with the normal rate of 3.60 for 1917 and 3.62 for 1916. The 1918 rate, it is stated, is the lowest recorded since 1911, when it was 4.45.

The report shows a total of 42,915 nonfatal injuries at metal mines, which is a decrease of 3,371 from 1917, the accident rate being 237.09 per 1,000 300-day workers as compared with 240.97 in 1917, and 250.64 in 1916.

The tables in the report represent the five divisions of the mining industry, as follows: Copper mines, 524 operators; gold, silver, and miscellaneous mines, 2,429 operators; iron mines, 176 operators; lead, and zinc mines (Mississippi Valley), 236 operators; nonmetallic mineral mines (not including coal), 271 operators.

It is explained that as many of the States now have compensation laws the bureau's classification of serious and slight injuries is on a 14-day (2 week) basis in order to conform to the classification used by the States. The classification of injuries includes three types, as follows:

FATAL, SERIOUS, AND SLIGHT INJURIES IN METAL MINES IN THE UNITED STATES
IN 1917 AND 1918.

Injury.	1917	1918	Per cent of decrease.
Fatal.....	852	646	21.2
Serious (time lost more than 14 days):			
Permanent disability—			
Total ¹	39	62	² 58.9
Partial ³	666	640	3.9
Others.....	10,220	9,066	11.3
Slight (time lost, 1 to 14 days, inclusive).....	35,361	23,147	6.3
Total.....	46,286	42,915	7.3

¹ Permanent total disability is loss of both legs or arms, one leg and one arm, total loss of eyesight, paralysis, or other condition permanently incapacitating the workman from engaging in a gainful occupation.

² Increase.

³ Permanent partial disability means loss of one foot, leg, hand, eye, one or more fingers, one or more toes, any dislocation where ligaments are severed, or any other injury known in surgery to be permanent partial disability.

The following table shows the number of employees, the number of fatalities and injuries, and the fatal and nonfatal accident rates, by kind of mine, during 1917 and 1918.

NUMBER EMPLOYED, NUMBER KILLED AND INJURED, AND FATAL AND NONFATAL
ACCIDENT RATES IN MINES DURING THE YEARS 1917 AND 1918.

Kind of mine.	Active operators.	Number of men employed.	Average days worked.	Number killed.	Number injured (time lost more than 1 day).	Number 300-day workers.	Killed per 1,000 300-day workers.	Injured per 1,000 300-day workers.

¹ Excluding the deaths from the North Butte mine fire, the fatality rate was 3.34 per 1,000, the lowest on record for the copper group.

The causes of accidents are shown in the report in considerable detail. Comparative data for accidents at metal mines, coal mines, and quarries are given.

INDUSTRIAL POISONS.

Tellurium as an Industrial Health Hazard.

A STUDY of tellurium was recently made by Dr. Shie and Dr. Deeds, of the United States Public Health Service; the results were published in Public Health Reports (Apr. 16, 1920, pp. 939-954), in a preliminary report, the purpose of which is "to invite the attention of industrial hygienists and physicians to the importance of tellurium as an industrial health hazard."

The possibility that this substance might act as an industrial poison first came to the attention of the authors in 1918 while they were making a study of lead poisoning in an electrolytic lead refinery. It was noted that practically all the men employed in one department—13 in number—smelled strongly of garlic and, upon being questioned, complained of dry skin and a loss of the sweat function. These men were working in the silver refinery around blast furnaces and were subjected to high temperatures. The slime from the electrolytic tanks was treated to remove the Doré metal, and tellurium was encountered as an impurity. The temperature attained in the blast furnaces was about 1,200°-1,400° F., and tellurium fumes were given off probably in the form of hydrogen telluride, a compound analogous to sulphuretted hydrogen and arseniuretted hydrogen. Tellurium was also present in the dust about the furnaces, probably in the form of the oxide and telluride. No other men in the plant complained of similar symptoms, and no others came into contact with tellurium.

The 13 men were examined with the following result: Seven showed evidences of tellurium absorption as indicated by garlic odor to the breath, sweat, and urine, to dryness of the mouth, and metallic taste. Five of these had a considerable inhibition of the sweat function, and the two who did not, had worked only two weeks; three of the five had a dry, itching skin, anorexia, nausea, some vomiting, and some degree of depression or somnolence. Six of the men examined had a rash distributed quite generally over the body, and "it is probable that the dry skin, incident to the complete or partial suppression of the sweat function, had something to do with its inception." The length of time the men examined had been employed was, in the majority of cases, very short, so that in a number of cases there had hardly been time enough for the mild chronic effects of tellurium to have developed, and the one who had worked in the department for the longest period—two and a half years—had been exposed to the hazard only at rare intervals.

Chemistry and Properties of Tellurium.

THE paper considers the chemistry of tellurium, which in the past was scarce, the only method of obtaining it being a very lengthy one of extraction applied to large masses of ores. It is now obtained from the dross produced in electrorefining. In this process the slime which settles to the bottom of the electrolytic tanks is treated to

recover the more precious metals, and the residuum is then treated to obtain the tellurium. It may also be prepared from its minerals or from the residue in several metallurgical processes.

Tellurium is a bluish-white silverlike element possessing metallic luster. It is a poor conductor of heat and electricity. It melts at 452°C . When slowly cooled from the molten state it forms hexagonal rhombohedral crystals, isomorphous with sulphur and selenium. In physical properties it resembles the metals, but in chemical properties it is decidedly nonmetallic. It forms one of the oxygen family of elements and is closely related to sulphur and selenium of the same family.

Summary.

AFTER a consideration of the poisonous properties of tellurium, based upon the 13 cases examined and upon experimental work, the paper concludes with this summary to which a "fairly complete" bibliography of the subject is added:

Until within recent years tellurium was considered only as more or less of a chemical curiosity. With the development of the electrolytic-refining industry, however, its production has increased, and it can no longer be considered a rare element. As yet no very important industrial use has been found for it; but numerous research organizations, among them the National Research Council, are attempting to discover ways in which it can be used on a large scale in industry. At present at least one large corporation has erected a plant for the sole purpose of isolating and refining tellurium. With the further development of such activities it is to be expected that the production of tellurium will greatly increase and that concomitantly there will be an increase in the health hazard incident to the increased exposure of the workers. We might then expect to encounter the severe effects of tellurium poisoning, such as are now manifested by laboratory animals under the influence of fairly large doses of tellurium.

The tellurium poisoning encountered thus far in industry has not been severe. The primary effects are suppression of the sweat, of the saliva, and of the acid in the gastric juice. This leads to a dry, itching skin, dry mouth, metallic taste, anorexia, nausea, vomiting, indigestion, and constipation. Somnolence is often a prominent symptom. The earliest symptom of tellurium absorption is the garlic odor to the secretions and excretions due to methyl telluride. Secondary effects to be expected are impaired nutrition with emaciation and, where the workers are exposed to high temperatures, increased susceptibility to heat exhaustion.

The diagnosis of tellurium poisoning may be made from the garlic odor of the excretions, the suppression of the sweat, the dryness of the mouth, and the demonstration of tellurium in the urine or feces.

The preventive measures are similar to those used for other metallic poisons and may be summed up as good working conditions and proper personal hygiene.

In treatment, of course, the most important measure is the removal of cause. After that pilocarpin may be used to counteract the effect of the tellurium, and the avenues of elimination should be opened and excretion favored by promoting secretions, diuresis, and free bowel movements. Hydrochloric acid may be administered to remedy the deficiency of acid secretion. The remainder of the treatment is symptomatic.

The prognosis so far has been good, the condition gradually improving upon prompt removal of the cause. This is due to the fact that no serious cases have thus far been encountered. It is thought that the prognosis will be less favorable when more severe poisoning occurs as a result of greater absorption of tellurium incident to its increased production.

The 13 workers reported are still under observation and physical examinations will be made from time to time to observe their condition. New workers in the department will also be closely watched. Along with this, laboratory work is being done to determine more accurately the toxicity of tellurium and its effects upon the blood, blood pressure, kidneys, etc.

It is hoped that samples of the air which the men breathe may be collected while they work, so that determinations of the amount of tellurium taken into the lungs may be determined. Similar determination of the amounts ingested would also be of value, and it is expected that they will be made.

Hexamethylene-tetramine as a Poison in the Rubber Industry.

THE rash produced by hexamethylene-tetramine upon workers in the rubber industry and a means of prevention are discussed in a paper published in the *Journal of Industrial Hygiene*¹ as a reprint from the *India Rubber World*, of November 1, 1919.

The paper gives the results of a study made by the research laboratory of the Firestone Tire & Rubber Co., Akron, Ohio, of organic accelerators of vulcanization. Special attention was given to the subject of toxicity with the purpose of finding an accelerator which combines excellent acceleration with a minimum of toxic action, and the authors state that "Knowing that many rubber companies are using hexamethylene-tetramine or 'urotropin,' it was thought that a study of the toxicology of this substance would be of interest not only to ourselves, but also to those who are already using this accelerator." The investigation was extended to cover the probable cause of its action and to find, if possible, an antidote or simple means of prevention.

The paper refers to a report of an investigation into the toxic properties of the more commonly used accelerators presented in September, 1918, by the committee on organic accelerators of the rubber section of the American Chemical Society, in which the action of hexamethylene-tetramine was summarized as follows:

Symptoms of poisoning.—Rash and inflammation of skin which has been in repeated contact with stock containing this material. In severe cases, blisters filled with watery fluid result.

Antidote.—Cleanliness and care in regard to clothing are the best preventives. Change of occupation will cause the rash to disappear, leaving no permanent effects.

In order to study the nature of the irritation ascribed to this accelerator, the tetramine was applied in powdered form and in water solution to different parts of the body of men selected for these tests. The results of the experiment were negative and the accelerator was then introduced into a factory compound in order to study its effect upon actual working conditions, the workmen handling the experimental stock being carefully observed. This test was begun in cool weather and for some time no deleterious effect was observed. With the approach of warmer weather, however, the action of the hexamethylene-tetramine began to manifest itself, usually appearing first as a rash on the wrist or forearm and in many cases remaining confined to these parts, but in others spreading to the face and neck, especially around the eyes, and occasionally appearing on the shoulders, legs, and even across the stomach. The authors concluded that perspiration undoubtedly plays an important part in the production of the rash, as it became almost epidemic with the rise in temperature.

Sodium Bicarbonate in Prevention and Treatment.

THE account of the use of sodium bicarbonate in the treatment of this rash upon men selected for tests is given in detail, and the authors state:

¹ Poisons in the rubber industry. By Norman A. Shepard and Stanley Krall. In *Journal of Industrial Hygiene*, Boston, May, 1920, pp. 33-38.

On the strength of these results bicarbonate solution was provided, so that all the men handling the raw stock containing the hexamethylenetetramine could obtain it if troubled with this rash. Though it was not possible to obtain as accurate data on all those applying the solution, the reports obtained from both the foremen and the men using the solution were very encouraging. * * *

While it is true that the necessity for the application of any preventive or prophylactic solution, such as bicarbonate of soda or borax, is a serious drawback to the use of a substance as an accelerator, it does not prohibit its use. It offers a better solution of the difficulty certainly than that offered by the committee on accelerators. "Change of occupation," with the entailed loss of wages and curtailed production, can scarcely be considered a satisfactory antidote, either from the standpoint of the employee or employer.

It was found that the use of the bicarbonate solution is attended by no disagreeable results, except a considerable smarting when first applied to a severe case, and that it can be applied to the face and neck and even around the eyes with perfect safety. While it has an apparent curative effect, it is stated to be unquestionably chiefly preventive, the result being that while further development of the rash is prevented the old rash is allowed to heal without further infection. The authors believe that, while their observations are based upon a comparatively small number of cases, "the results seem to justify the conclusion that bicarbonate can be used successfully in controlling the hexamethylene-tetramine rash."

Industrial Blood Poisons in Anilin Manufacture.

"INDUSTRIAL blood poisons" is the title of an article by C. R. Newton, in the Journal of the American Medical Association, Chicago, April 24, 1920 (pp. 1149, 1150), which is based on a first-hand study of 8 cases of benzene and anilin intoxication selected from a number of cases occurring in anilin manufacture during the early days of the war before the manufacturing methods were improved; this was followed by a study of 10 cases subject to more or less exposure to benzene, made for the purpose of determining the cumulative properties of this poison. The following is the history of a typical case:

Mr. A., chemist, aged 30, in charge of operations, who had been working intensively in benzene for about two weeks, complained, June 12, 1916, of headache, anorexia, lassitude, and loss of weight. Suddenly pain in the abdomen developed, accompanied by nausea and vomiting. Physical examination detected nothing abnormal. Temperature and pulse were normal. An examination of the blood, however, revealed a marked leucopenia. The blood was normal in color, but seemed to be lacking in viscosity. There were 5,760,000 red blood cells per cubic millimeter; 1,200 white blood cells; hemoglobin, 85 per cent (Sahli). The differential count revealed: Large mononuclears, 39 per cent; small mononuclears, 0; polymorphonuclears, 54 per cent; eosinophils, 0; transitionals, 0.6; other cells, 0; total, 93.6 per cent.

The intoxication in this case was largely from inhalation. Aside from the blood findings, the physical picture is that of a nervous dyspepsia, which was probably true in this case, as the man was of a nervous temperament and anxious over the responsibility of his position.

After a month's leave of absence with complete rest, the leucocyte count became normal and the patient made a complete recovery. It was not our observation that a leucopenia alone, of the severity herein described, would cause symptoms.

The author states it as his opinion—

Not that benzene and its amino-derivatives possess any very definite cumulative action, but that the anemias of which they are the cause follow a definite intoxication

or a series of definite intoxications. It remains to be determined, however, whether or not the constant inhalation of even minute quantities of benzene vapor from spreading machines, cement cans, and other sources would tend to interfere with proper oxygenation of the blood and tissues, even when there is no cell destruction, and thus undermine the worker's resistance to disease.

The following conclusions are reached:

1. Workers chronically exposed to benzene may show leucopenia without any other symptoms, and make complete recovery.
2. Acute exposure to anilin and nitrobenzene vapors produced cyanosis with destruction of the red blood corpuscles, but with little change in the white corpuscles with recovery. In one case in which free benzene was presumably present, there was destruction of white cells without appreciable destruction of red cells, and a more rapid recovery, that is, in three days.
3. The maximum white cell destruction by benzene, and the maximum red cell destruction by anilin-nitrobenzene, may not be reached for several hours after the onset of the symptoms.
4. Workers exposed for long periods to benzene may not have a leucopenia; apparently, therefore, the action is not cumulative.

WORKMEN'S COMPENSATION.

Constitutionality of Amendment to Judicial Code as to Maritime Injuries.

ON MAY 17, 1920, the United States Supreme Court handed down a decision involving the much disputed point of conflict between Admiralty jurisdiction in maritime cases and the jurisdiction of the State workmen's compensation laws. The decision was rendered in the case of *Knickerbocker Ice Co. v. Stewart* (40 Sup. Ct. —), which was brought to the Supreme Court on a writ of error from a decision of the Court of Appeals of the State of New York. In this case William Stewart, while employed by the Knickerbocker Ice Co. as a bargeman, and while he was doing work of a maritime nature, fell into the Hudson River and was drowned. His widow elected to take compensation under the State workmen's compensation act and the State industrial commission allowed an award. The employer appealed from this award, first to the appellate division of the New York Supreme Court and thence to the court of appeals, but in each case the award of the industrial commission allowing compensation was affirmed. Thereupon the employer took the case to the United States Supreme Court on a writ of error. The Supreme Court reversed the decision of the New York Court of Appeals and remanded the case for further proceedings not inconsistent with its opinion. A dissenting opinion was rendered by Mr. Justice Holmes in which Justices Pitney, Brandeis, and Clarke concurred. These same justices dissented in the opinion handed down in the case of *Southern Pacific Co. v. Jensen*, 244 U. S. 205, 37 Sup. Ct. 524. (See MONTHLY REVIEW for July, 1917, pp. 100-103.)

The constitutionality of the New York compensation act was assailed in the United States Supreme Court in the *Jensen* case, in which the State courts had affirmed an award for maritime injuries, and the law was declared unconstitutional because it compulsorily included employers engaged in maritime work as well as those engaged in industrial enterprises. This inclusion of maritime cases was held to be an invasion of the exclusive jurisdiction vested in the Federal courts under section 2, Article III, of the United States Constitution and clause 3, sections 24 and 256, of the Federal Judicial Code. Subsequent to the decision rendered in the *Jensen* case Congress amended clause 3 of section 256 of the Judicial Code, which contains a saving clause allowing suitors to choose whether to sue in admiralty or at common law, by adding thereto the following: "and to claimants the rights and remedies under the workmen's compensation laws of any State," making the third clause read as follows:

The District Court shall have original jurisdiction as follows:

Third. Of all civil causes of admiralty and maritime jurisdiction, saving to suitors in all cases the right of a common-law remedy where the common law is competent to give it, and to claimants the rights and remedies under the workmen's compensation law of any State.

The Knickerbocker Ice Co. in this case contended that the New York workmen's compensation law did not in any way apply to it notwithstanding the amendment to the Judicial Code above quoted. It based its case almost entirely upon the decision in the Jensen case and maintained that Congress had no authority to make the workmen's compensation laws of any State applicable to admiralty or maritime cases. In this contention the company was upheld by the Supreme Court, which declared the aforementioned amendment to the Judicial Code unconstitutional and void. Mr. Justice McReynolds, who rendered the majority opinion, said in part:

The act [amendment to clause 3, section 256, Judicial Code] only undertook to add certain specified rights and remedies to a saving clause within a code section conferring jurisdiction. We have held that before the amendment and irrespective of that section, such rights and remedies did not apply to maritime torts because they were inconsistent with paramount Federal law—within that field they had no existence. Were the added words therefore wholly ineffective? The usual function of a saving clause is to preserve something from immediate interference—not to create; and the rule is that expression by the legislature of an erroneous opinion concerning the law does not alter it. Endlich, *Interpretation of Statutes*, sec. 372.

Neither branch of Congress devoted much debate to the act under consideration—altogether, less than two pages of the Record (65th Cong., 1st sess., pp. 7605, 7843). The Judiciary Committee of the House made no report; but a brief one by the Senate Judiciary Committee probably indicates the general legislative purpose. And, with this and the accompanying circumstances, the words must be read.

Having regard to all these things, we conclude that Congress undertook to permit application of workmen's compensation laws of the several States to injuries within admiralty and maritime jurisdiction; and to save such statutes from the objections pointed out in *Southern Pacific Co. v. Jensen*. It sought to authorize and sanction action by the States in prescribing and enforcing, as to all parties concerned, rights, obligations, liabilities, and remedies designed to provide compensation for injuries suffered by employees engaged in maritime work.

And so construed, we think the enactment is beyond the power of Congress. Its power to legislate concerning the rights and liabilities within the maritime jurisdiction and remedies for their enforcement, arises from the Constitution, as above indicated. The definite object of the grant was to commit direct control to the Federal Government; to relieve maritime commerce from unnecessary burdens and disadvantages incident to discordant legislation; and to establish, so far as practicable, harmonious and uniform rules applicable throughout every part of the Union.

To say that because Congress could have enacted a compensation act applicable to maritime injuries, it could authorize the States to do so as they might desire, is false reasoning. Moreover, such an authorization would inevitably destroy the harmony and uniformity which the Constitution not only contemplated but actually established—it would defeat the very purpose of the grant.

The Dissenting Opinion.

THE dissenting opinion, as presented by Mr. Justice Holmes, after reciting the references to the amended sections of the Judicial Code, continues in part as follows:

I do not suppose that anyone would say that the words, "The judicial power shall extend * * * to all cases of admiralty and maritime jurisdiction" (Constitution, Art. III, sec. 3), by implication enacted a whole code for master and servant at sea, that could be modified only by a constitutional amendment. But somehow or other the ordinary common-law rules of liability as between master and servant have come to be applied to a considerable extent in admiralty. If my explanation, that the source is the common law of the several States, is not accepted, I can only say I do not know how unless by the fiat of the judges. But surely the power that imposed the obligation can change it, and I suppose Congress can do as much as the judges who introduced the rules. For we know that they were introduced and can not have been elicited by logic alone from the medieval sea laws.

But if Congress can legislate, it has done so. It has adopted statutes that were in force when the act of October 6, 1917, was passed, and to that extent has acted as definitely as if it had repeated the words used by the several States—not an unfamiliar form of law. [Cases cited.] An act of Congress, we always say, will be construed so as to sustain it, if possible, and therefore if it were necessary the words “rights and remedies under the workmen’s compensation laws of any State” should be taken to refer solely to laws existing at the time, as it certainly does at least include them.

Mr. Justice Holmes cited in support of his position, and that of his concurring colleagues, decisions sustaining the validity of State pilotage laws, and also pointed out that in the saving of a common-law remedy, Congress “adopted the common law of the several States within their several jurisdictions, and, I may add by way of anticipation, included at least some subsequent statutory changes,” citing cases.

However desirable it may seem to any student of the problem that there should be a compensation system for maritime workers such as practically all the States having important harbors have enacted, the fact remains that Congress in its attempt to provide this system through its amendment of the Judicial Code enacted a diverse and not a uniform method of adjudication. The laws of New York cover the great harbor of the city of the same name, while the port of Boston is covered by a compensation law differing considerably in its provisions; and the same is true for Philadelphia, Baltimore, Baton Rouge, Galveston, San Francisco, Seattle, etc. Furthermore, three inharmonious modes of recovery apparently existed side by side: In admiralty, at common law, and under the compensation law of the locality where the accident occurred or the contract was entered into. Such diversity makes for uncertainty and conflict, and is at direct variance with “the object of vesting in Congress the power to regulate commerce with foreign nations and among the States,” which “was to insure uniformity of regulation against conflicting and discriminating State legislation” (*County of Mobile v. Kimball* (1880), 102 U.S. 691); or, as said in the Jensen case above cited, “If New York can subject foreign ships coming to her ports to such obligations as those imposed by her compensation statute, other States may do likewise. The necessary consequence would be destruction of the very uniformity in respect to maritime matters which the Constitution was designed to establish.”

It is of interest to note the diversity of construction put upon the amendment to the Judicial Code prior to the decision in the instant case. A Federal judge of the New York district took the view that the amendment had the effect of incorporating into the Judicial Code compensation legislation whether existing or of subsequent enactment; so that in States where other liabilities were abolished in favor of the remedy provided by compensation, this provision was operative in maritime cases since the amendment of the code, and none other could be availed of. (*The Howell*, 257 Fed. 578.) On the other hand, a court of the same rank of the district of Oregon took the ground that since the amendment to the code placed the three remedies on an equality, the Oregon compensation law could not be regarded as exclusive, and that Federal courts must administer maritime law as provided by Congress, unaffected by State legislation. (*Rohde v. Grant Smith Porter Co.*, 259 Fed. 304.) The decision of the Supreme Court of California, March 12, 1920, in a case

not yet reported, goes still further, holding the amendment to the Judicial Code unconstitutional on grounds closely paralleling those announced by the Supreme Court of the United States in its decision two months later. (*Sudden & Christensen v. Industrial Accident Commission*, — Pac. —.)

The decision of the Supreme Court has at least the merit of ending the very apparent uncertainty as to the effect and validity of the Federal amendment under consideration, and points the way to authoritative action by Congress; or, as said by the Seamen's Journal of San Francisco, "In one way the decision is a distinct relief. The maritime workers of the United States now know where they stand in this matter. Let them now get together and clear the decks for action that will lead to the speedy enactment of a Federal workmen's compensation law."

Of course the decision invalidates awards made under the amendment, and terminates all claims under consideration where the injury comes under maritime law.

In California, for instance, the decision has destroyed every hope the widows and children of the men lost in the *Romokc*, *San Gabriel*, *George Loomis*, and *J. A. Chandler* ever had of getting any compensation whatever. It is worse than useless for them to bring suits in a court of admiralty, for the law expressly limits the shipowner's liability for damage resulting from the loss of the ship to the amount salvaged from the wreck, and the above named ships were all total losses.

Even the long-established saving of a common-law remedy found in the code can hardly be looked upon as valuable in view of the decision of the Supreme Court in a case in which the 20th section of the seamen's act of 1915 (38 Stat. 1185) was under consideration. This section undertook to abolish the doctrine of fellow service as between seamen having command and those under their authority. It was held (*Chelentis v. Luckenbach S. S. Co.*, 247 U. S. 372, 38 Sup. Ct. 501) that it was only possible to enforce by common-law remedies any right sanctioned by the maritime law, this being the utmost effect that could be given to the saving in the Judicial Code. "We find nothing therein which reveals an intention to give the complaining party an election to determine whether the defendant's liability shall be measured by common-law standards rather than those by the maritime law." The section of the seamen's act under consideration was said to "disclose no intention to impose upon shipowners the same measure of liability for injuries suffered by the crew while at sea as the common law prescribes for employers in respect of their employees on shore." This decision so completely invalidates the anticipated effect of section 20 of the seamen's act that an amendment thereof has been incorporated in current legislation which proposes an election on the part of a seaman suffering personal injury by which he may bring suit, with right of trial by jury, in lieu of a maritime proceeding, and have in his action the benefit of "all statutes of the United States modifying or extending the common-law right or remedy in cases of personal injury to railway employees." This has the advantage, of course, of making applicable the provisions of a Federal law, but in the face of the decision in the *Chelentis* case it is not apparent that it has surmounted the difficulties therein interposed to the operation of the original section. Furthermore, it proposes at best to give but a right of action under the limitations of a type of

law that has been largely disappointing to its proponents in its own field, and whose spirit is not in harmony with maritime law.

Those who have studied the workings of the railroad act for interstate commerce in comparison with the results of compensation legislation when applied to similar employment in carrying on intrastate commerce can but regret that the efforts put forth to secure an amendment permitting suits for damages could not have been directed to the securing of a compensation law, which after all more nearly approaches the spirit of the maritime law in its disregard of the matter of negligence as a basis for claims, and has been abundantly approved in the 42 States of the Union in which such laws now exist. The decision in the Knickerbocker case shows the necessity for congressional action in behalf of maritime employees just as emphatically as the decision in the case of the New York Central R. R. Co. v. Winfield (244 U. S. 147, 37 Sup. Ct. 546) demonstrates the necessity of Federal action for interstate carriers by railroad. The reasons for the failure thus far to secure this much-needed legislation for employees in interstate and foreign commerce need not be gone into, but it is evident that every added failure to secure the benefits of improved legislation by piecemeal or compromise action only emphasizes the duty and responsibility of Congress to provide a uniform law, efficiently administered, for the compensation of injured workers and their dependents in these great fields which are beyond the control of the States.

Recent Reports on Operation of Workmen's Compensation Laws.

Illinois.

THE Industrial Commission of Illinois recently published a brief report on its activities for the year ending June 30, 1919, with statistics for the calendar years 1917 and 1918.¹ The report opens with a review of the amendments to the State law enlarging benefits in a number of cases, and making procedure more simple and direct. It is shown that 294 compensation cases were pending or taken up to the court on appeal from the orders of the commission during the year. Of these, 149 were pending at the end of the year. In 92 cases the decision of the industrial commission was affirmed, while in 29 the court disagreed with the commission on some point. In 21 cases the matter was remanded to the commission, in 6 the award was vacated, and in 2 the record of the commission was quashed. Important decisions of the supreme court are also noted, particular emphasis being placed on one in which a one-armed workman lost a leg as a result of an accident in his employment and was held to be entitled to compensation by the last employer for permanent total disability.

The total number of arbitrations filed for the year ending July 1, 1919, was 5,696, which was 52 per cent more than the number for the

¹Industrial Commission, State of Illinois. Annual report for fiscal year ending June 30, 1919, and statistical report for calendar years 1918 and 1917. Springfield, Ill., 1920. 49 pp.

preceding year. There were 2,869 awards made, or just about one-half of the number of arbitrations filed. The total amount awarded was \$2,796,905.

Requests for lump sums numbered 3,014. Lump sums were granted in 2,359 cases, of which 2,051 were for nonfatal injuries, and 308 for fatal injuries; final rejection was made in 193 cases, while all other cases were continued or otherwise disposed of.

The statistical tables are presented, "as far as possible," in accordance with the recommendations of the statistical committee of the International Association of Industrial Accident Boards and Commissions. A new feature of the table of awards is one showing the unpaid amounts on awards for the year. The number of accidents for 1918 (calendar year) was 38,247. Of these, 35,989 were reported as closed cases, and 2,258 as open or pending. The amount of compensation paid for both classes of cases was \$3,399,243, while the amount still to be paid was \$1,747,252. Medical and funeral expenses are reported at \$497,691, though it is said that medical payments undoubtedly greatly exceeded the above amount, as it does not include payments on noncompensable accidents nor medical payments made by contracts.

The largest number of accidents, 8,490, is reported from the mining of coal; next come metal products, with 4,405; foods, beverages, and tobacco, 4,001; and machinery and instruments, 3,107. Out of 38,247 compensable cases, 629 were for death, 10 for permanent total disability, 3,904 for permanent partial disability, and 33,704 for temporary total disability. A table giving the location of injuries shows that there were 2,654 head injuries, of which more than one-half—1,456—affected one eye, while 60 affected both eyes. Injuries to the face and neck numbered 938, to the trunk 5,310, to the upper extremities 17,060, to the thumb 1,717, and to the index finger 2,989. The lower extremities suffered 12,285 injuries.

Other tables show the nature of the injury by cause of accident, nature of injury and result of disability, and distribution by counties, by months, by sex and age, and by industry, dependency, and average cost. The average cost of temporary total disabilities was \$54; of permanent partial disabilities, \$511; of permanent total disabilities, \$11,961; and for death, \$2,703.

Similar tables to those noted above are given for the year 1917, besides a detailed table of fatal accidents showing occupation, age, cause of accident, number of dependents, compensation, medical and hospital expenses, and funeral costs.

Kentucky.

THE third annual report of the compensation board of Kentucky² begins with an account of the maintenance fund, which is derived from a 4 per cent tax on the net premiums received by insurance companies on compensation business done in this State, and a like tax on self insurers. The income for the first year was \$36,236, and expenses amounted to \$26,589. Income during the second year and balance carried over from the first year totaled \$46,053,

² Workmen's Compensation Board, Commonwealth of Kentucky. Annual report of department, June 30, 1918, to June 30, 1919. [Frankfort, 1919.] 82 pp.

of which \$26,025 was expended. The third year showed receipts and balance carried over from preceding year totaling \$106,593 and expenses amounting to \$32,388, leaving a balance of \$74,205 on June 30, 1919. The low cost of administration, which is said to be due to restricting the employment of assistance to that which was absolutely necessary, "consistent with the growth and development of the department," is emphasized.

The number of accidents reported during the year was 13,894, of which the coal-mining industry was responsible for 4,784; 5,850 agreements were approved by the board, covering compensation amounting to \$293,522, besides medical, surgical, and hospital expenses. The satisfactory operation of the act is said to be evidenced by the fact that up to June 30, 1919, 5,674 employers had accepted the provisions of the law, while only 42 had withdrawn their acceptances, and in no case was a complaint filed as a cause of the withdrawal.

The Kentucky statute is unique in legislation in the United States, in that it requires a written election by the employee if he is to come under the act. This is said to be a necessity on account of the provision of the State constitution, which was held by the court of appeals of the State to invalidate the earlier law which presumed election by the employee where the employer had accepted the provisions of the act. An amendment to the constitution is recommended, so as to avoid the necessity of this provision, inasmuch as it is thought to militate against the satisfactory operation of the law, employees being debarred from rights under it by any failure to take the necessary step, even though they may have intended to do so.

The tables show the number of accidents by industries, by cause of injury, by nature of injury, the amount of awards, the number of closed cases, and by duration of disability in days. There is some lack of coordination and classification of the material, so that the data can not be made use of as readily as might be desired. The report closes with a discussion of procedure, and a reproduction of the rules used and an explanation of the forms adopted by the board.

Oklahoma.³

THE compensation law of this State and rules of procedure of the commission are presented in the first 60 pages, following which are opinions of the industrial commission, and of the supreme court in cases appealed from the commission. This is the second volume of the series, and presents 58 decisions by the commission and 7 by the supreme court. The volume is published in accordance with an order by the commission, which directs that persons transacting business before the commission and desiring to refer to its decisions or orders, "shall refer to same by citing the official reports by style of case and page and volume number of said reports." Following the opinions reproduced is a digest presenting, under various topical headings, brief statements of findings, with citations to cases. Indexes to the law and the rules conclude the report.

³ Industrial Commission. Reports, vol. 2. Cases determined by the commission from Jan. 1, 1918, to Jan. 1, 1920. Oklahoma City, 1920. 327 pp.

Oregon.⁴

THE report of the Industrial Accident Commission of Oregon is practically entirely statistical, and differs from the usual report in that it presents data in cumulative form covering three years' operation of the law. The act came into effect July 1, 1914, but the first year's experience is omitted from the cumulative tables, so that but three years' experience is shown. The reason for cumulative rather than separate tables "is that the larger volume of experience and the longer period covered tend to smooth out the irregularities of the separate years, thus making the results more reliable."

Certain facts are given, however, for the fiscal year covering July 1, 1917, to June 30, 1918. The entire business of compensation is transacted through a State fund to which employers contribute at classified rates, while 1 cent for each day worked is to be contributed by the employee. For the year named the employers contributed \$1,769,368, and workmen \$156,152. The total receipts were \$2,181,431 and disbursements for benefits \$1,349,510, while administrative expenses amounted to \$106,428. The balance on hand June 30, 1918, was \$1,026,785.

Receipts for the three-year period averaged for all industries \$3.33 per year per \$100 of pay roll; disbursements equaled \$2.51 per \$100 of pay roll. "The three-year experience shows that of the total expenditures by the commission the injured workmen or their dependents received in compensation benefits an average of \$0.9298 of every dollar of such expenditures, and that but \$0.0702 was required to carry the benefits to claimants." Figured on the basis of 300 actual working days representing a full-time worker the summary for the three years shows that 121,272.94 full-time workers suffered 25,119 accidents, losing a total of 2,773,670 days, or 22.871 days per full-time worker. The number of accidents per full-time worker was 0.207.

Fatal cases receiving awards through the three years were 225 in number, or nine-tenths of 1 per cent of all cases; they were responsible, however, for 44.85 per cent of the total awards. Permanent total disability cases numbered 17, or 0.07 per cent of the total, and received 5.21 per cent of the awards. Permanent partial disability resulted in 1,196 cases, or 4.76 per cent of the total, incurring 22.26 per cent of the awards. There were 23,681 cases of temporary total disability, or 94.27 per cent of the total, and costing 27.68 per cent of the aggregated awards. The number of awards for the three years was 25,119 and the aggregate awards, \$2,381,237.

A valuable detailed table shows by industries and groups of industries, receipts and disbursements for the funds, showing separately the gross pay roll for 36 months on which premiums were based, premiums received, workmen's payment, other sources of income, claim awards, and administrative expenses. The total receipts and disbursements per \$100 of gross pay roll, and disbursements per working day, are also shown. The gross pay rolls for 36 months amounted to \$118,610,478. There were employers' premiums of \$3,103,561, and workmen's contributions of \$332,375, the total

⁴ Third report of the State Industrial Accident Commission, showing the cumulative experience for the three-year period ending June 30, 1918. Salem, 1920. 81 pp.

receipts aggregating \$3,947,386. Total disbursements amounted to \$2,977,651, or \$0.082 per working day.

The second table shows frequency of accidents by industries and extent of disability; and the third, severity of injuries by industries and extent of disability. In computing severity the commission makes use of the weightings adopted by the committee on statistics and compensation insurance cost of the International Association of Industrial Accident Boards and Commissions. The fourth table presents compensation and medical aid by extent of disability.

The following table summarizes the experience for the year ending June 30, 1918, and the three years' experience:

COMPENSATION PAID, AND MEDICAL COSTS, BY NATURE OF DISABILITY, FOR THE YEAR AND FOR THREE YEARS ENDING JUNE 30, 1918.

Nature of disability.	Year ending June 30, 1918.				Three years ending June 30, 1918.			
	Compensation.		Medical aid.		Compensation.		Medical aid.	
	Num- ber of cases.	Average amount.	Num- ber of cases.	Average cost.	Num- ber of cases.	Average amount.	Num- ber of cases.	Average cost.
Deaths.....	103	\$5,122.90	57	\$47.49	225	\$4,746.61	(1)	\$30.60
Permanent total disabilities.....	9	7,072.22	6	204.15	17	7,302.80	(1)	205.43
Permanent partial disabilities.....	605	303.99	306	54.80	1,196	443.19	(1)	58.68
Temporary total disabilities.....	12,024	27.73	6,686	13.80	23,651	27.83	(1)	13.61
	12,741	91.81	7,052	15.54	25,119	94.80	13,582	16.11

¹ The number of cases in which medical aid was furnished is not given separately. The costs here shown are based on an aggregate of 13,582 cases. In the remaining cases, medical aid was given under contract, and the cost per case could not be determined.

Other tables show causes of accidents by extent of disability; nature of injury by cause; nature and location of injury, by extent of disability; infected injuries; sex and wages; and sex and age. The concluding table shows remarriage experience of widows to whom compensation awards have been made for the full four-year period of the operation of the act up to June 30, 1918. The table shows widow's age at death of husband, grouped by five-year periods, the average age of children, their number, and the number of widows remarrying in each of the four years. The total number of widows was 159, of whom but 17 have remarried. Seven remarriages occurred in the first year, 6 in the second, 3 in the third, and 1 in the fourth; one widow died in the first year without remarriage. The aggregate years of widowhood amounted to 239. The year in which widowhood occurred is not indicated, but the diminishing number of marriages from the first to the fourth year indicates, so far as any opinion can be formed from such a slight basis, that the tendency to remain single and draw the compensation benefits has increased rather than diminished.

Washington.⁵

THE Industrial Insurance and Medical Aid Departments of Washington combined in the publication of their report for the year ending September 30, 1919. The report opens with an ac-

⁵ Eighth annual report of the Industrial Insurance and Medical Aid Departments for the 12 months ending Sept. 30, 1919. Olympia, 1920. 95 pp.

knowledge of the benefits derived from enlarged appropriations, making it possible to raise the efficiency of the department. It is noted later, however, that the natural growth of the industries of the State was greater than was anticipated when the appropriation was made, so that even with undesirable economies, a deficit is likely to develop. Recommended amendments were adopted by the legislature of 1919, so that a number of new industries have been brought under the act, and other desirable changes have been made. However, these changes result in such modifications of the reports as to render the report for the current year not comparable with the earlier reports in a number of respects. The desirability of uniformity is dwelt upon at some length, and is "regarded as an important objective." A prime existing difficulty is the variation in waiting time. "A State that has a seven-day waiting period has no record of approximately 25 per cent of industrial accidents. Where the waiting period is two weeks, the State will have no record of about 50 per cent of industrial accidents." The original law of Washington had no waiting period, but in 1917 a seven-day waiting period was established. This change "had the immediate effect of reducing the relative number of accidents reported from time to time, because in most instances where the loss of time was less than seven days, there being no compensation involved, neither employer nor employee could be induced to render any report." It was estimated that with a uniform waiting period about 90 per cent of the statistical matter could be made uniform in the different State reports.

Washington is one of the States having a compulsory compensation system and an exclusive State fund. The accident fund is divided into 38 classes, for each of which balances are separately maintained. At the beginning of the year covered the total balance for all funds was \$876,626, while at the end of the year it was \$1,072,742. The aggregate for reserve funds for all classes likewise increased from \$2,616,649 to \$3,606,735. The medical aid fund showed a balance on hand at the end of the year of \$160,902.

The average cost of insurance for each class per \$100 of pay roll is shown for the years 1913 to 1918, inclusive. This ranges from 11 cents in lithographing, printing, etc., 16 cents in moving pictures, theaters, etc., and 30 cents in those industries which are permitted to come under the act by elective adoption, to \$4.44 in the construction of canals, pile driving, the building of breakwaters, etc., and \$4.05 for work on bridges and trestles, millwrighting, tanks and towers. The rate for shipbuilding has averaged \$1.23 per \$100 of pay roll; for logging, sawmills, etc., \$1.92; for coal mines, \$3; for smelters, etc., \$1.37; and for tunnels, sewers, drilling wells, etc., \$2.75. "This is industrial insurance at actual cost. Every dollar paid in by the employers of the State goes direct to their injured employees." The report presents comparisons drawn by statisticians who have examined the laws of States having competitive State funds, setting forth the savings that would result if the rates and system in force in Washington had been in effect in these States.

The number of accidents reported for the year was 22,273, a decrease of 18.4 per cent as compared with the previous year. Of these, 368 were fatal and 30 were adjudged to be permanent total

disabilities. Adjudications made during the year allowed awards in 11,803 cases of temporary disability, 418 cases of death, and 29 cases of permanent total disability. There were also 2,366 awards for permanent partial disability. The average duration in work days of temporary total disability is given as 35.9, and the average cost as \$50.02. Permanent partial disabilities received an average award of \$374.79. It is of interest to note the closeness of this average to that for the year 1916, when there is added to the earlier average the 30 per cent increase due to the increased benefits allowed by amendment to the law. Thus in 1916 the average for permanent partial disabilities was \$289, which, increased by 30 per cent would be \$375.70, or within a dollar of the experience of 1919. Of the 418 claims for death, 171 had been suspended or rejected by the end of the year. The 247 cases pensioned had been awarded an average rate of \$25.44 per month; the average amount of reserves for pensions was \$3,670.37. For permanent total disability the average monthly pension was \$27.17 and the average reserves \$4,062.23.

Other tables show the number of dependents; nativity; conjugal condition; causes of injury, mechanically produced and nonmechanical, by industry; classes; duration of disability; severity ratings, and the specific injuries resulting under different classifications as amputations, fractures, dislocations, etc.

Wyoming.⁶

THE Workmen's Compensation Department of Wyoming issued for the year ending December 31, 1919, a report entitled "Employers' Number." While this report gives in detail the operations of the compensation law of the State for the calendar year 1919, it also summarizes its operations for the 57 months since the act came into operation on April 1, 1915. The first report covered 18 months, the second 15 months, while the third and fourth relate to calendar years. These variations of periods render comparisons possible only for 1918 and 1919.

The report is designated the "Employers' Number" because it is addressed particularly to employers with an effort to promulgate a clearer understanding of what is termed "The Compensation Principle." The law is a compulsory one, and the report attempts so to present the facts as to emphasize the service that is rendered rather than to make prominent the compulsory tax feature of the law. The cooperative benefits are therefore emphasized as well as the moderate costs.

Insurance under the law may be effected only in the State fund, and is required of all employers engaged in extra hazardous employments enumerated in the act. During the first 18 months 241 employers were contributors, while during the second period (15 months) there were 501. During 1918, 664 employers became contributors, while in 1919 the number increased to 1,032. Employers' assessments in 1918 amounted to \$215,498, and in 1919 to \$240,308.

The State appropriated \$40,000 for each of these years, while interest on deposits and investments amounted in 1919 to almost

⁶ Fourth report of the Workmen's Compensation Department for the 12 months ending Dec. 31, 1919. Laramie, Wyo., 1920. 165 pp.

as much—\$32,803. Disbursements for injuries in 1918 amounted to \$94,954, and in 1919 to \$131,758. Expenses in 1918 were just under 3.9 per cent of the employers' assessments, while in 1919 they slightly exceeded 3.8 per cent. The total receipts for the State fund during the period of its existence amounted to \$1,167,498, while the total disbursements were \$418,835, leaving a balance of \$748,663.

Awards made during 1919, amounting to \$144,252, were distributed in the following proportions: For death, 45.2 per cent; for permanent total disability, 6.6; for permanent partial disability, 29.8; and for temporary disability, 18.4. Taking the whole experience of the nearly five years' operation of the law, there were 123 awards for death amounting to \$167,217; 11 for permanent total disability, amounting to \$15,158; 292 for permanent partial disability, amounting to \$131,684; and 2,187 for temporary disability, amounting to \$79,626. The total aggregates 2,613 claims paid, amounting to \$393,685. There were 23 supplemental and follow-up orders aggregating \$10,426, in addition to the foregoing.

The tables show the number and cause of accidents by nature of industry, receipts and disbursements by industries, and a statement of the individual contributions of employers during the year.

Manitoba.⁷

THE Workmen's Compensation Board of Manitoba presents in its annual report summary figures for 1919, and details for 1917-1918. An amendment of 1919 permits employers not covered by the act voluntarily to place their employees under it, and a growing tendency is noted to make use of this opportunity. The effect of the increased cost of living on the allowances provided for widows and children leads to a recommendation that monthly payments in each case be increased 50 per cent, for widows from \$20 to \$30, and for children from \$5 to \$7.50.

The number of accidents reported during 1919 was 2,829, an increase of about 5 per cent over the number reported in 1918. There were 1,684 claims filed, 985 cases in which there were no claims or the claims were not accepted, and 160 cases in which the files were incomplete at the time of the report. Of the claims filed 33 were for death, 70 for permanent disability, either partial or total, and 1,581 for temporary disability.

Comparisons with 1918 show a considerable increase in the amount of business transacted, and a canvass is being made by the board to secure compliance with the law on the part of all classified employers. Some flagrant violations and evasions of the act were found, in all 19 employers being prosecuted, with conviction obtained and a fine imposed in every case. A notable case was that of the Canadian National Railway, which had refused to make its contributions to the administrative fund for two years, but which has finally complied with the act and is now making its contribution as contemplated by law. The administrative expense is borne by a contribution of $7\frac{1}{2}$ per cent of the premiums paid insurance carriers, and at the same rate on an estimated premium chargeable self insurers.

⁷ Report for 1919 of the Workmen's Compensation Board, Manitoba. Winnipeg, 1920. 32 pp.

The actual expenses of administration were 6.3 per cent of the estimated premium income for 1919, while in 1918 the rate was 5.69.

The number of accidents occurring in 1918 for which report is made was 1,731. Of these 1,587 were temporary in their results, causing disability for an average of 23.25 days. There were 102 cases of permanent disability, of which but two caused an impairment of the earning capacity amounting to 70 per cent or more. There were 42 deaths, involving 61 total dependents and 4 partial dependents.

The amounts awarded were not given for the different classes of injuries, but the tables show time lost, average age and wage, causes of accidents, month of occurrence, duration of temporary disabilities, nature of injuries, and industries in which permanent disability and death cases occurred.

LABOR LAWS AND DECISIONS.

Retirement of Civil-Service Employees.

THERE was enacted into law on May 22, 1920, a retirement bill for employees in the classified civil service of the United States, this date being the day of its approval by the President. The bill known as the Lehlbach-Sterling bill, from the chairmen of the committees of the House and Senate, respectively, having the matter in charge, passed the Senate April 3, 1920, and passed the House with amendments on the 30th of the same month. The measure then went to conference, where an agreement was reached which received the indorsement of both Houses. This completed the legislative processes in connection with a measure which terminates efforts extending over 30 years. Indeed, civil-service retirement bills were introduced in both Houses of Congress as early as 1887.¹ In 1890 Postmaster General Wanamaker introduced in his annual report a recommendation for a method of retiring superannuated Government employees, with particular reference, of course, to the Postal Service. Repeated recommendations have been made by practically all the Cabinet officers, by the Civil Service Commission, and by others interested, looking toward the same end, and it is estimated that at least 50 bills have been introduced in Congress for its accomplishment.

A prime hindrance to the enactment of any law was the decided divergence of opinion as to how the costs should be met. Some favored retirement at the entire cost of the Government, while others took the view that contributions made by the employees should constitute the sole source of retirement benefits. The idea of joint contributions was finally adopted as a solution of the problem. There were of course some in both Houses who regarded the entire plan as objectionable, but the great majority took the view that it was both economical for the Government and humane to its employees to provide a system of retirement for superannuated workers.

As originally drawn, the bill contemplated retirement for civil-service employees generally at the age of 65 years—mechanics, city and rural letter carriers and post-office clerks being eligible for retirement at the age of 62 years, and railway postal clerks at 60

¹ The so-called Pendleton act, establishing the classified civil service, was enacted in January, 1883. In January, 1887, Senator Hampton of South Carolina and Mr. Crain of Texas, introduced bills in the Senate and House, respectively, "To establish a retired list for persons employed in the Civil Service." A year later Mr. Crain reintroduced his bill in the 50th Congress. No further action in this line was taken until in the 54th Congress bills were introduced by Senator Proctor of Vermont, Mr. Wilson of Ohio, and Mr. Powers of Vermont in December, 1895; by Mr. Tawney of Minnesota in 1896; and by Mr. Brosius of Pennsylvania, Mr. Gillett of Massachusetts, and Mr. Hurley of New York in 1897. Senator Lodge of Massachusetts and Messrs. Hurley, Brosius, Gillett, and Tawney introduced bills in the 55th Congress; and Messrs. Brosius and Boutell (Illinois) in the 56th. Beginning with the 54th Congress, therefore, the effort to secure a retirement system has been practically continuous, though no committee action was taken on any of the bills noted above except an adverse report on Mr. Crain's second bill.

years of age. These recommendations were made by the committees of both Houses, but when the bill was taken up in the Senate there was strong opposition to these age limits, and a uniform retirement age of 70 years was substituted for the various ages named in the bill. When it reached the House the original age limits were restored, but in conference a compromise was made by leaving the age 70 years for the general classes of employees, while for mechanics, letter carriers, and post-office clerks the age was made 65 years, and for railway postal clerks 62 years, and these provisions stand as the terms of the law, there being no opposition in the House, though in the Senate there was some effort to secure an insistence on a uniform 70-year basis. However, the report was considered on May 17 by unanimous consent and adopted without a record vote.

Conditions of retirement are fixed by length of service, no retirement for age being authorized until after 15 years of service, which secures the minimum benefit of 30 per cent of the employee's average annual salary or pay for the 10 years next preceding the date of retirement. The annuity for this class may not exceed \$360 per annum nor be less than \$180. After service of 18 years but less than 21 the percentage is 36, and the annuity ranges from \$216 to \$432. The next grade includes employees whose service ranges from 21 to 24 years. These receive 42 per cent of their basic salary or pay, not less than \$252 nor more than \$504 per annum. Those serving from 24 to 27 years before reaching the age of retirement receive 48 per cent of their pay as an annuity, not less than \$288 nor more than \$576. From 27 to 30 years the percentage is 54, and a sum not less than \$324 nor more than \$648. The maximum is 60 per cent of the annual pay for employees having served 30 years or more, the amounts ranging from \$360 to \$720 per annum.

Employees not wishing to retire on reaching the age fixed by the law may apply for an extension of two years, and if the head of the office in which the applicant is employed certifies to his efficiency and willingness to remain in the service, and that such continuance would be advantageous to the public service, the employee may be retained for a term not to exceed two years on approval and certification by the Civil Service Commission. A similar extension may be had for an additional term, and so on, but at the end of 10 years from the date of the act but two such extensions will be permitted.

Employees "totally disabled for useful and efficient service by reason of disease or injury not due to vicious habits, intemperance, or willful misconduct on the part of the employee" may be retired on the same basis, in so far as periods of service and amounts of benefits are concerned, as are persons reaching the age of 70 years. Annual examinations are provided for to determine the continuing disability of the annuitant.

Persons covered include all employees in the classified civil service of the United States, including superintendents of national cemeteries, employees of the Superintendent of the United States Capitol Buildings and Grounds, the Library of Congress, and the Botanic Gardens. Excepted are persons appointed by the President and confirmed by the Senate, postmasters, and such employees of the Light-house Service as come within the provisions of a special retirement act for that service. It also includes all regular annual employees of the

municipal government of the District of Columbia, including those receiving per diem compensation but rendering continuous service. Members of the police and fire departments are excluded, as are school officers and teachers, other retirement systems being provided for them; other public school employees are included, however.

The contributions to be made by employees begin on "the first day of the third month next following the passage of this act," and are made monthly thereafter, the amount being 2½ per cent of the basic salary or pay, therefore not affecting any bonus that may be received. Provision is made for the conservation and investment of these deductions in a special fund to be known as the civil service retirement and disability fund. Such deductions are to be credited to the individual employee, and in case of his absolute separation from the service before becoming eligible for retirement on an annuity, all deductions shall be returned with accrued interest compounded at the rate of 4 per cent per annum. It is also provided that if an annuitant shall die before receiving annuities equal in amount to the total deductions from his or her salary, together with interest thereon at 4 per cent compounded annually, any excess remaining shall be paid over in one sum to the legal representatives of the deceased annuitant; or if the employee shall die before retirement, the amount deducted shall be paid with interest to said representatives.

The act is to be administered by the Commissioner of Pensions, although the Civil Service Commission is to maintain a complete record of transfers, appointments, changes in grade, separation from service, etc., so as to furnish the Commissioner of Pensions with an adequate basis for the handling of the system.

The date for the coming into effect of the act, so far as deductions from salaries are concerned, is reported by the Pension Bureau to be August 1, the first salary payment to be affected being that due on August 15, following which deductions will be made on each pay day, thus keeping all accounts current and equalizing the burden of the deductions, unless the Comptroller of the Treasury shall decide that deductions may be made at the end of each two-week period instead of at the end of the month only. The retirement of persons eligible by reason of attained age will take place August 21, in the absence of action for an extension of service, the employment status terminating August 20.

Federal Provision for Vocational Rehabilitation of Disabled Persons.

A SUMMARY account of legislation looking to the rehabilitation of persons disqualified for employment chiefly by reason of industrial injuries is carried in the MONTHLY LABOR REVIEW for April, 1920 (pp. 202-206).¹ Some of these laws provide for co-operation with the Federal Government in the undertaking, as was pointed out in the article noted.

On June 21, 1919, the Senate passed a bill providing for cooper-

¹ States which have enacted rehabilitation laws are Massachusetts, in 1918, and the following in 1919: California, Illinois, Minnesota, Nevada, New Jersey, North Dakota, Oregon, Pennsylvania, and Rhode Island. Full information is not at hand as to the current year, but laws have been enacted in New York and Virginia this year.

ation with the States in the vocational rehabilitation "of persons disabled," meaning thereby "any person, who by reason of a physical defect or infirmity, whether congenital or acquired by accident, injury, or disease, is, or may be expected to be, totally or partially incapacitated for remunerative occupations." Instead of acting on this measure the House passed quite a similar one on October 17, 1919, which it transmitted to the Senate for its consideration. On April 12, 1920, the Senate acted by substituting its measure for that sent over from the House, and a conference was requested. No conference was ever held, but the Senate's measure was referred to the Committee on Education. On May 25, 1920, the House took up the Senate measure under a special rule and agreed to its acceptance on a motion to concur in the Senate amendment. The bill was approved by the President on June 2.

It is apparent from the scope of the act that it is much wider than if restricted to persons disabled by injuries received in industry, and the inclusion of persons suffering from congenital disability or disease met with some opposition. The term "rehabilitation" is defined as meaning "the rendering of a person disabled fit to engage in a remunerative occupation." The act appropriates \$750,000 for the fiscal year ending June 30, 1921; and "for the fiscal year ending June 30, 1922, and thereafter for a period of two years, the sum of \$1,000,000 annually." This amount is to be divided among the States prorated according to their population, not less than \$5,000 per year to be allotted to any State. States are to furnish dollar for dollar for any Federal aid accepted, and plans of administration, courses and methods of instruction, qualifications of teachers, directors, etc., and methods of placement are to be approved by the Federal Board of Vocational Education. The act is in effect a supplement to the Smith-Hughes Vocational Act of 1917, and contemplates administration in the various States by the same boards that are provided for to co-operate under the Smith-Hughes Act. The Federal board is allowed a special appropriation of \$75,000 annually for the four-year period contemplated for the operation of the act under its initial enactment, for the purpose of making studies as to the rehabilitation of disabled persons and their placement in suitable or gainful positions and for administrative costs.

Constitutionality of the Seamen's Act Upheld.

THE United States Supreme Court recently handed down an important decision interpreting section 4 of the Seamen's Act of March 4, 1915 (38 Stat., 1164), which relates to the payment of the wages of seamen. The section provides that every seaman on board a vessel is entitled to demand and have paid to him by the master of the vessel at every port where the vessel loads or discharges cargo, one-half of the wages which he has then earned, anything in the contract of employment to the contrary being declared void. It is also provided that in the event of the refusal of the master to pay one-half the wages due, the seaman then becomes entitled to full payment of his wages and can resort to the United States courts to enforce his rights under the act. The act specifically includes foreign seamen on board foreign vessels while in harbors of the United States.

In this case (*Strathearn S. S. Co. v. Dillon*, 40 Sup. Ct., 350) Dillon, a British subject, shipped on board a British vessel in Liverpool, England, under shipping articles which stated that the voyage was to end at Liverpool in not more than three years and that no wages were to be paid until the end of the voyage. This agreement was made in May, 1916. When the vessel arrived at Pensacola, Fla., in July, 1916, Dillon, in accordance with the above provision of the United States seamen's act, made a demand for one-half of his wages which he had then earned. The master of the vessel refused this demand, whereupon Dillon filed in the district court of the United States a libel against the ship for the entire amount due him.

The district court found against Plaintiff Dillon, upon the ground that his demand, because made within five days after the arrival of the vessel in an American port, was premature. Dillon appealed to the circuit court of appeals which reversed this decision and held that he was entitled to a recovery (256 Fed., 631, 168 C. C. A., 25). This decree was brought before the United States Supreme Court by the *Strathearn Steamship Co.* on a writ of error. The Supreme Court affirmed the decision in favor of Dillon.

The contentions of the steamship company were (1) that the act applied to American seamen only and therefore could not be invoked by a British subject, and (2) that the act is unconstitutional in that it is destructive of contractual rights.

Both these points were resolved against the company. In deciding the first point the court said in part:

But, taking the provisions of the act as the same are written, we think it plain that it manifests the purpose of Congress to place American and foreign seamen on an equality of right in so far as the privileges of this section are concerned, with equal opportunity to resort to the courts of the United States for the enforcement of the act.

In deciding in favor of the constitutionality of the act, the court continued as follows:

We come then to consider the contention that this construction renders the statute unconstitutional as being destructive of contract rights. But we think this contention must be decided adversely to the petitioner upon the authority of previous cases in this court. The matter was fully considered in *Patterson v. Bark Eudora* (190 U. S., 169, 23 Sup. Ct., 821, 47 L. Ed., 1002), in which the previous decisions of this court were reviewed, and the conclusion reached that the jurisdiction of this Government over foreign merchant vessels in our ports was such as to give authority to Congress to make provisions of the character now under consideration; that it was for this Government to determine upon what terms and conditions vessels of other countries might be permitted to enter our harbors, and to impose conditions upon the shipment of sailors in our own ports, and make them applicable to foreign as well as domestic vessels. Upon the authority of that case, and others cited in the opinion therein, we have no doubt as to the authority of Congress to pass a statute of this sort, applicable to foreign vessels in our ports and controlling the employment and payment of seamen as a condition of the right of such foreign vessels to enter and use the ports of the United States.

Although, as above stated, the constitutionality of the seamen's act had been previously sustained, the particular point here involved had never before been decided and for this reason the case was looked upon by the seamen's unions as a test case. The best legal talent obtainable was engaged by the organized seamen of America, and the result, it was said, "was as anticipated—a unanimous verdict for the constitutionality of the seamen's charter of freedom." It has long been the contention of American seamen that the United States by setting a high standard for the employment and protection of its

seamen would eventually compel other countries to bring their standards up to the same level. The above decision has for this reason been hailed by the organized seamen as a distinct triumph, and an advance toward this end. The importance attached to this case is indicated by the fact that in addition to the counsel for the parties, representatives of the British embassy and the United States were permitted to appear by special leave.

Austrian Law Establishing Chambers of Labor.

FOR decades Austrian wage earners have repeatedly (the first time in 1848) demanded that a legal institution be created for the representation of their interests. This demand has finally been realized through the recent enactment by the National Assembly of a law establishing chambers of labor (*Arbeiterkammern*).¹ The basic idea of the demand of the wage earners and also of the law is that, as corporations representing the interests of other classes of the population, such as chambers of commerce and industry (*Handels- und Gewerbekammern*), bar associations (*Advokatenkammern*), medical associations (*Aerztekammern*), etc., have been in existence for a long time, like corporations should also be created for the safeguarding of the interests of manual workers and salaried employees. Consistent with this idea the wage earners have always opposed the creation of so-called joint industrial councils (*Arbeitskammern*), in which both employers and employed were to be equally represented, and have insisted on the creation of chambers of labor in which the wage earners alone should be represented. Briefly summarized the provisions of the new law are the following:

The law states that it shall be the task of the chambers of labor to represent the economic interests and to promote the economic and social conditions of manual workers and salaried employees in industry, commerce, transportation, and mining. The duties assigned to the chambers are:

1. To render opinions and submit proposals to the authorities and legislative bodies as to the regulation of working conditions, protective labor legislation, workmen's insurance, the labor market, and on all matters of trade, industry, commerce, and transportation which directly or indirectly affect the interests of manual workers or salaried employees, and finally as to matters relating to housing, nutrition, hygiene, and education of the people.

2. To render opinions on bills, laws, and other legal regulations, dealing with matters enumerated under 1.

3. To render opinions as to the creation and organization of public institutions for the promotion of trades, industry, commerce, and transportation.

4. To cooperate in the industrial and economic administration and in measures and institutions relating to labor relations or the improvement of the economic and social situation of manual workers

¹ Die Gewerkschaft, vol. 12, No. 10. Vienna, Mar. 9, 1920.

and salaried employees, whenever special laws and regulations provide such cooperation.

5. To send representatives into other corporations and authorities or make proposals for appointments to such corporations or authorities whenever such action is provided by special laws or regulations.

6. To keep lists of occupational organizations of manual workers and salaried employees in existence within the district of the chamber.

7. To cooperate in the compilation of labor statistics and in investigations of social and economic conditions of manual workers and salaried employees.

8. To create and administer or to cooperate in the creation and administration of institutions for the improvement of the economic and social situation of manual workers and salaried employees, especially for the purpose of concluding collective agreements, the procuring of employment, the combating of unemployment, housing work, care for the nutrition and health of manual workers and salaried employees and of their families, promotion of vocational, general mental and physical training of manual workers and salaried employees, and of the growing generation.

The law orders all national Government offices, State governments, and councils to submit to the chambers of labor bills as well as regulations for the enforcement of laws affecting the interests of manual and nonmanual workers. It places the chambers of labor within the organization and under the supervision of the ministry for social administration.

Each chamber of labor is to be composed of two sections—a section for manual workers and one for salaried employees. A chamber may be composed of not less than 30 and not more than 100 members. The election of members is to be effected according to the principles of proportionate representation, by direct secret ballot, and for a term of 5 years. Each section forms a separate electorate.

Every manual worker or salaried employee, without distinction of citizenship, who on election day has completed his eighteenth year of age and has been employed at least two months within the district of the chamber of labor has the right to vote. All citizens of German Austria who on election day have completed their twenty-fourth year of age and have been employed as manual workers or salaried employees for at least 3 years are also eligible.

The newly elected chamber of labor is to be convened by the supervisory authority. At its initial session it shall elect from among its midst a president, whose election must be confirmed by the minister for social administration. The president is the legal representative of the chamber. The sessions of the chamber shall as a rule be public.

The costs of the chambers of labor are to be borne by the manual workers and salaried employees themselves. Contributions for the chambers of labor shall as a rule be collected by means of assessments upon the contributions for sick funds. The amount of these assessments is to be determined by the chambers of labor.

A chamber of labor is to be created in every locality in which a chamber of commerce and industry exists, i. e., in the cities of Vienna, Linz, Gratz, Leoben, Klagenfurt, Innsbruck, and Feldkirch.

At least once a year the directorates of all the chambers of labor are to meet in conference for the purpose of discussing matters of common interest. The chambers of labor are authorized to convene manual workers' and salaried employees' conferences to be attended by representatives of manual workers' and salaried employees' organizations and by the members of the manual workers' and salaried employees' sections of the chambers. These conferences are intended to bring about closer relations between the chambers of labor and the trade-unions.

Austrian Domestic Service Law.

DIE Gewerkschaft (Vienna), the official organ of the Austrian trade-unions for March 2, 1920, reports that after long discussions the Austrian National Assembly has passed a protective law for domestic servants. The enactment of the bill was greatly retarded by the contention of the bourgeois parties that the subject dealt with came within the competence of the provincial diets and not within that of the State. The real reason why these circles opposed the bill was that they disliked its basic idea of granting to domestic servants the same legal protection as that already enjoyed by industrial and agricultural workers. The regulation of the hours of labor of domestic servants aroused their strongest opposition.

Consequent to this opposition the bill underwent numerous amendments which weakened it considerably. The terms of the law as finally enacted are the following:

The law is applicable only to persons employed exclusively in domestic service and not to those simultaneously active in an agricultural establishment of their employer. Immediately on entering employment each domestic servant must, on his request, be issued a labor contract showing his rights and duties.

The wages of domestic servants are to be fixed according to local usage. Wages must be paid not later than on the first of each month. Servants not receiving board must be paid the board allowance agreed upon, semimonthly and in advance. If they are furnished board, it must be wholesome and sufficient and as a rule be the same as that furnished to adult healthy members of the family. Servants' quarters must be so constituted that they do not endanger their health and morals. Their sleeping rooms must have doors that can be locked from the inside, and they are to be furnished a safe, lockable receptacle for their personal belongings.

The law provides a daily uninterrupted rest of at least 9 hours, which, as a rule, shall fall within the period between 9 p. m. and 6 a. m. In addition, servants must be allowed a total of two hours' rest for the partaking of the principal meals. Servants under 16 years of age are to be allowed an uninterrupted daily rest of 11 hours and 3 hours' rest during their working time. Any curtailing of rest periods caused by work not permitting of delay must be compensated extra.

Domestic servants must be granted 8 hours' leave every second Sunday, this leave to begin not later than 3 p. m. If leave is to exceed 8 hours it must be previously agreed upon with the employer. In addition, they are to be given 4 hours' leave on one week day of each week, the leave to begin not later than 5 p. m. They must moreover be granted time for attending religious services. During the first year of his service each servant is entitled to one week of annual leave, during the second year to two weeks, and during the fifth year to three weeks. During his annual leave he is to receive full pay and in addition a subsidy in the following amount: In case of one week's leave, half a month's pay; in case of two weeks' leave, one month's pay; and in case of three weeks' leave, one and one-half month's pay. If a domestic servant is discharged by an employer with the obvious intent of depriving the servant of his leave, the latter may claim compensation in the amount of the allowance that would have been due him had he been granted leave.

In case of sickness a domestic servant is entitled to free medical treatment and medicines. If taken to a hospital he is, in addition, entitled to full pay. If the employer moves to another locality, the servant is under no obligation to follow him and can not be discharged for refusing to do so, and, as long as the service contract is not terminated, the servant may in addition to his pay also claim suitable compensation for the failure of the employer to furnish him board.

The term for giving notice is as a rule fixed at two weeks. This term may not be reduced to less than one week by agreement and must be of equal length for both parties. If unequal terms have been agreed upon, the longer term shall be valid. After having received notice of his discharge the servant is entitled to four hours' leave on two week days in order that he may have opportunity to find another place of employment. If a servant leaves his employment without valid reason before the expiration of his service contract the employer may either demand his return into his service or claim damages for breach of contract. If, on the other hand, an employer discharges a servant without valid reason, the latter, without prejudice to his claim for damages, has the right to demand full pay for the period up to the expiration of his service contract; he is moreover entitled to compensation for any amount he could have saved during that time or earned through other service. An entirely new feature of the present law is the provision which stipulates that after 10 years' continuous service with the same employer the servant is on discharge entitled to receipt of a bonus in the amount of three months' pay. This bonus increases by 5 per cent for each additional year of continuous service up to a maximum amount equivalent to one year's pay. If the service relation is, however, terminated through fault of the servant the latter loses his claim to a service bonus.

Whenever a servant leaves his service the employer is obligated to issue him a certificate which shall merely state the duration and nature of the service. Each servant must be provided with a service card issued to him by the proper communal authority.

The law contains special provisions for servants rendering services of a higher order, such as governesses, tutors, etc. They shall be furnished a separate room, whenever possible, and be granted a rest

period of three hours per day. After one year's service they are entitled to two weeks' leave and after two year's service to four weeks. They must be given 6 weeks' notice in case of discharge.

Disputes between masters and domestic servants are to be settled by the ordinary courts, i. e., by the court of that locality in which the servant was in service at the time he brought suit. Regulations to be issued for the enforcement of the present law shall, however, provide for the establishment of special conciliation boards for the settlement of disputes between masters and domestic servants.

The law became effective May 1, 1920.

LABOR ORGANIZATIONS.

European Trade-Union Statistics.

Compiled by ALFRED MAYLANDER.

Germany.

ACCORDING to a recent issue of the *Correspondenzblatt*,¹ the General Federation of German Trade-Unions, with which at present 54 federations (*Verbände*) of trade-unions are affiliated, has a membership of more than 7,500,000. In the following table is shown the membership of affiliated federations having more than 100,000 members:

FEDERATIONS OF THE GERMAN FREE TRADE-UNIONS WITH A MEMBERSHIP OF MORE THAN 100,000 AT THE END OF FEBRUARY, 1920.

Federation.	Membership.	
	Before the war.	End of February, 1920.
Metal workers.....	531,991	1,600,000
Agricultural workers.....	22,531	650,000
Factory workers.....	207,330	600,000
Transport workers.....	228,207	540,000
Textile workers.....	133,034	450,000
Building trades.....	309,562	430,430
Mine workers.....	101,956	400,000
Railway men.....		400,000
Woodworkers.....	192,465	370,000
Salaried employees.....	35,219	367,000
Municipal workers.....	54,522	269,915
Tailors.....	49,145	136,000
Total.....	1,865,962	6,213,345

Thus the above 12 federations comprise more than 6,200,000 members, or 83 per cent of the entire membership of the General Federation. Ten more federations have a membership of more than 50,000, 11 of 20,000 to 50,000, 7 of 10,000 to 20,000, 12 of 1,000 to 10,000, and 2 of less than 1,000 members.

Of the entire membership somewhat more than 5,000,000 belong to industry, handicraft, and mining, 917,000 to commerce and transport, 650,000 to agriculture and forestry, 670,000 to State and municipal undertakings, 157,000 to the hotel and restaurant trade and musical and theatrical callings, and 38,000 to the domestic service group.

Austria.

THE annual report of the executive committee of the Austrian Federation of Trade-Unions (*Gewerkschaftskommission Deutsch-österreichs*) for the year 1919² shows that the total paying mem-

¹ *Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands*. Berlin, Mar. 6, 1920.

² *Die Gewerkschaft*. Vienna, Mar. 16, 1920.

bership of the unions affiliated with the federation was 378,381, as compared with 262,808 in 1918. The membership movement during the period 1913 to 1919 is shown in the following table:

PAYING MEMBERSHIP OF THE AUSTRIAN FEDERATION OF TRADE-UNIONS, 1913 TO 1919.

Year.	Paying membership.	Increase (+) or decrease (-).
1913.....	331,816	
1914.....	292,103	- 39,713
1915.....	154,281	-137,822
1916.....	130,697	- 23,584
1917.....	142,925	+ 11,598
1918.....	262,808	+120,513
1919.....	378,381	+115,573

It should be noted that the membership figures shown in the preceding table include only paying members, i. e., members having made 52 weekly contributions to their union during the year. During 1918 and 1919 unemployment was very extensive in German Austria and a large number of organized workers did not pay regularly their union dues. The actual membership of the Austrian trade-unions must therefore have been considerably larger than that shown in the table. In comparing the figures for 1919 with those of preceding years it should be considered that the peace treaty separated from Austria all crown lands of non-German nationality.

The increase in membership during the year 1919 is chiefly due to the affiliation of numerous organizations of nonindustrial wage-workers, such as bank employees, policemen's unions, postal and telegraph employees, domestic servants, hospital nurses, etc. Through the affiliation of these organizations the Federation of Austrian Trade-Unions has become the official representative not only of the industrial workers of Austria but of Austria's entire wage-earning population.

Czecho-Slovakian Republic.

A BROCHURE³ issued by Rod. Tayerle, secretary-general of the General Federation of Czecho-Slovak Trade-Unions, contains the following data as to membership of the unions affiliated with this federation.

MEMBERSHIP STATISTICS OF THE GENERAL FEDERATION OF CZECHO-SLOVAK TRADE-UNIONS, 1897-1918.

Year.	Federation.	Unions.	Membership.	
			Total.	Female.
1897.....	68	22	7,102	502
1907.....	59	796	71,001	2,393
1912.....	53	1,449	107,255	8,093
1914.....	50	1,135	55,175	5,268
1916.....	49	753	23,932	3,239
1917.....	50	766	42,728	6,468
1918.....	50	1,178	161,247	23,824

³ Les Syndicats Professionnels Tchécoslovaques. Paris, 1919. 22 pp.

Data for the year 1919 are not available. The brochure states, however, that at the end of June, 1919, 42 reporting federations show a membership of 450,896, of which 98,150 were women, and estimates the total membership, inclusive of nonreporting federations, at 500,000. This large increase is chiefly due to the affiliation of the German trade-unions in the German-speaking districts of Bohemia and Moravia with the Czecho-Slovak General Federation.

The strongest federations represented in the general federation are those of the metal workers with 95,130 members; agricultural workers with 90,000 members; miners with 49,654 members; railroad men with 42,262 members; unskilled workers with 35,656 members; textile workers with 29,616 members; building trades workers with 12,009 members; woodworkers with 14,769 members; and glass workers with 12,500 members. Women are strongly represented in agricultural unions (50,000), textile workers' unions (17,321), and unskilled workers' unions (7,996).

In 1918 the 50 federations affiliated with the general federation had receipts amounting to 2,544,846 crowns (\$516,603.74, par) and expenditures amounting to 1,828,903 crowns (\$371,267.31, par). Their combined capital was 2,875,077 crowns (\$583,640.63, par). They disbursed in benefits 451,107 crowns (\$91,574.72, par), of which 63,449 crowns (\$12,880.15, par) were for strike benefits and 124,366 crowns (\$25,246.30, par) for sick benefits. The general federation publishes a semimonthly bulletin, *Odborové Sdružení československe*, and since 1915 also a journal, *Zájmi Žen*, for its female members.

Hungary.

ACCORDING to an article in the *Correspondenzblatt*⁴ the trade-unions in Hungary had some 500,000 members in November, 1918. An immediate result of the revolution was that nearly all classes of workers, including railway men, civil-service employees, private salaried employees, teachers, brain workers, etc., began to organize, whereby it appeared that the new trade-unionists were more radical than the most extreme of the old organizations. The brain workers, especially, became ardent adherents of the soviet dictatorship, while the old unions, without exception, were opposed to it. The failure of the old trade-unions to support the soviet government was the prime cause of its collapse.

The first effect of the debacle of the communistic régime was the closing of all industrial establishments. The owners took back the socialized undertakings into their own hands, dismissed the workers, and proceeded to take stock of what was left to them. Extensive unemployment continues up to the present date, scarcely 10 to 15 per cent of the workers being employed. In Budapest about 200,000 workers are idle, and in the provincial towns matters are not much better.

The radicalism of the new unions founded since November, 1918, did not stand the test of such severe trials. Part of them, especially the unions of the brain workers, speedily took refuge in the Christian-National camp and many of the newly founded ultraradical unions became now ultra reactionary. Thus ended the supercommunists of

⁴ *Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands*. Berlin, Mar. 6, 1920.

the Hungarian commune. Although the old conservative unions were opposed to the soviet, the new Government seizes every pretext to persecute them. In the provinces the military functionaries of the new Government arbitrarily dissolved all trade-unions and seized their funds. Since August, 1919, thousands of organized workers have been thrown into prison or interned in concentration camps, although no indictable offense has been proved against them.

Holland.

THE Dutch Federation of Trade-Unions (*Nederlandsch Verbond van Vakverenigingen*) reports⁵ that on January 1, 1920, the movement numbered 247,870 members. During 1919 the membership increased by 56,805, as against an increase of 28,000 in 1917, and 31,000 in 1918. During the last quarter of 1919 the number of male members increased by 17,120 and that of female members by 1,412

Denmark.

THE progress of the trade-union movement in Denmark during 1919 is illustrated in *Social-Demokraten*⁶ from figures published by the Danish Trade-Union Association.

The total number of workers organized in unions was 360,016 at the end of 1919. Of these, 277,392 were affiliated with the association, as compared with 255,150 at the end of 1918. Of the affiliated organizations the growth of membership has been largest in the Danish General Workers' Union, with an increase of 5,454, in the Textile Workers' Union with 2,754, in the Agricultural Workers' Union with 2,000, in the Municipal Workers' Union with 1,628, the Smiths' and Machinists' Union with 1,231, and the Railway men's Union with 1,202.

Among the nonaffiliated organizations the telephone workers record an increase from 3,200 to 5,300 members, the mercantile clerks from 19,800 to 29,770. The Bricklayers' Union shows a decrease in membership from 8,024 to 6,324.

Switzerland.

IN SWITZERLAND the individual trade-unions were so busy during the last two years with wage movements, the development of their organization, and benevolent institutions that their reports to their central organization, the *Gewerkschaftsbund*, were greatly delayed. Owing to this delay the *Gewerkschaftsbund* was but lately able to publish statistics on the Swiss trade-union movement for the year 1918.⁷ At the end of that year the unions affiliated with the *Gewerkschaftsbund* had 177,143 members, of which 26,647 were women. The increase in membership over the preceding year was 29,446. The report states, however, that 85,076 new members were admitted during 1918. As the increase in membership at the end of the year was only 29,446 there must have been a large number of resignations. During the year under review the switchmen's, loco-

⁵ Rotterdamsche Courant. Rotterdam, Mar. 27, 1920.

⁶ Social-Demokraten. Copenhagen, Mar. 17, 1920.

⁷ Die Gewerkschaft. Vienna, Feb. 24, 1920.

motive engineers', and trainmen's unions are the only ones having experienced a decrease in membership. This decrease was largely due to curtailment in the operation of trains. The following unions showed the largest increases in membership: Building trades, workers in communal and State employment, workers in foodstuff industries, mercantile and transport establishments, woodworkers, textile and metal workers. The cities having the largest number of organized workers were Zürich (22,662), Basel (14,172), and Bern (12,385). The three cantons of the same name had likewise the largest number of trade-union members among their population, the number of trade-union members being 44,367 in the Canton of Zürich, 35,934 in the Canton of Bern, and 14,172 in the Canton of Basel (city).

The membership dues had to be increased considerably during 1918, owing to increased expenditures. In 1917 the highest weekly membership dues were 1.85 francs (35.7 cents, par); in 1918, however, 2.25 francs (43.4 cents, par). The annual receipts of the trade-unions totaled 5,242,808 francs (\$1,011,861.94, par). Included in this sum are State and cantonal subsidies in the amount of 169,918 francs (\$32,791.17, par) for unemployment funds and of 156,900 francs (\$30,281.70, par) for sick funds. The expenditures of the union amounted to 5,347,394 francs (\$1,032,047.04, par), and thus exceeded the receipts for the year. Seventy-one and four-tenths per cent of the expenditures were for benefits.

The Gewerkschaftsbund reports 1,800 wage movements for the year 1918, affecting 9,253 establishments and 325,240 workers. The great majority of these movements, 1,533 affecting 7,786 establishments with 300,868 workers, did not involve any stoppage of work. In 264 instances, affecting 1,464 establishments and 24,318 workers, the wage movement culminated in a strike, and in four instances affecting three establishments and 64 workers in a lockout. The total loss of wages through labor disputes was 2,230,294 francs (\$430,446.74, par). Strike benefits for 289,860 days were paid in the amount of 894,650 francs (\$172,667.45, par) by central labor organizations and in the amount of 162,967 francs (\$31,452.63, par) by local labor organizations. The average number of days lost per striker was 12. Most of the wage movements terminated with partial success for the workers, only 71, or 4 per cent, failed entirely. The wage increases obtained totaled 2,562,064 francs (\$494,478.35, par) per week. The curtailment of hours of labor shows a total gain of 320,614 hours per week, or of 3½ hours for the individual worker. Collective agreements affecting 2,414 establishments and 15,274 workers were concluded in 202 instances.

The report states that at the end of the first six months of 1919 the membership of the unions affiliated with the Gewerkschaftsbund had passed the 200,000 mark.

STRIKES AND LOCKOUTS.

Strikes and Lockouts in the United States, 1916, 1917, 1918, and 1919.

Compiled by EDSON L. WHITNEY.

DURING the past six years the United States Bureau of Labor Statistics has kept a record of such strikes in this country as have come to its attention. The department has no authority to require reports relative to strikes from anyone, and therefore is obliged to obtain its information in such way as it can from such sources as are available. During these six years this information has been obtained from agents of the Bureau in the field, reports of commissioners of conciliation of the Department of Labor and other similar boards, reports of the various State labor boards, lists of strikes issued by labor, trade, and other organizations, and from clipping bureaus, supplemented by an examination of 25 daily papers printed in the more important industrial cities of the country, 100 or more labor papers, as many trade-union periodicals, and 20 leading trade papers. During the year 1919, 6,931 circulars of inquiry asking information in regard to about 3,500 reputed strikes and lockouts were sent to employers reported to have had strikes in their establishments and to officials of unions whose members had been concerned in or were believed to have knowledge of labor troubles. Of this number 2,222 were returned answered in whole or in part, 351 were returned undelivered for various reasons, and the remainder were unanswered. In addition 206 letters were sent. While this report, based on the data secured from the above-mentioned sources, omitting such reputed strikes as the returned schedules of inquiry indicated had been erroneously reported, is not based on a complete list of all strikes that have occurred in the country during the years under review, for such a list is unobtainable, it is believed that no strikes of importance have failed to come to the attention of the Bureau, and that the report is reasonably complete. Statistics for the four years 1916, 1917, 1918, and 1919 are given for purposes of comparison of two years of the war with the years immediately preceding and following.

The table following shows the number of strikes and lockouts beginning in each month during 1916, 1917, 1918, and 1919:

TABLE 1.—NUMBER OF STRIKES AND LOCKOUTS BEGINNING IN EACH MONTH, 1916, 1917, 1918, AND 1919.

Year.	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.	Month not stated.	Total.
Strikes:														
1916.....	180	203	289	419	604	310	310	318	217	257	193	147	174	3,681
1917.....	274	204	308	431	451	313	414	353	340	317	251	184	454	4,324

1918.....	8	11	11	11	6	6	6	5	10	-----	5	10	16	105
1919.....	5	7	6	14	25	12	6	10	13	8	6	6	3	121
Total:														
1916.....	188	206	294	434	617	354	313	326	252	261	197	149	198	3,789
1917.....	288	211	318	445	463	323	448	360	349	321	257	196	471	4,450
1918.....	191	223	311	319	391	295	285	278	207	145	207	249	236	3,337
1919.....	189	190	181	262	413	315	366	383	390	304	151	100	130	3,374

The large increase in number of strikes during the month of May in each year is accounted for by the fact that the trade agreements in many industries terminate on the 30th day of April and the unions very generally ask for an increase in wages in making the new agreement with their employers. Reports for the closing months of the year 1919 are incomplete, since reports, aside from those obtained from the daily and weekly papers and periodicals, frequently do not reach the Bureau until several months after the strike has ended. Corrected figures for these months will therefore undoubtedly show an increase over those here given.

Although the number of strikes during 1919 was not appreciably larger than in 1918 and was less than in 1916 or 1917, the number of persons on strike during the year 1919 was greatly in excess of the number on strike in any of the three preceding years, due to the number of strikes in which large numbers of persons were involved. The strike in which the largest number of persons was involved in 1916 was the men's clothing strike in New York City in December of that year, involving 60,000 employees. No strike in 1917 involved as many as 40,000 persons. In 1918 the strike involving the largest number of persons was that of machinists in northern New Jersey in July, where 60,000 persons struck.

In 1919 there were nine disturbances in each of which 60,000 or more persons were directly concerned: A general strike in Tacoma and Seattle in February in sympathy with the metal-trades strikers, in which 60,000 persons were involved; 65,000 employees in the Chicago stockyards struck in August; 100,000 longshoremen along the Atlantic coast struck in October; 100,000 employees in the shipyards of New York City and vicinity struck in October; 115,000 members of the building trades were locked out in Chicago in July; 125,000 in the building trades in New York City struck in February; 250,000 railroad shop workers struck in August; 367,000 iron and steel workers struck in September; and 435,000 bituminous coal

miners struck in November. The number of persons concerned in these nine strikes and lockouts was upward of 1,600,000, while the total number of persons involved in strikes and lockouts during 1919 was 4,112,507.

The strikes of 1919 have not been accompanied by the violence and loss of life that have at times characterized the strikes of former years, due perhaps to the fact that employers more frequently closed their establishments during the strike, and employed strike breakers in a less number of cases. On the other hand, the number of working days lost in 1919 increased greatly and the average duration of strikes was nearly twice that in each of the preceding three years. It is difficult to particularize, for many of the strikes involving a few thousand persons caused the public more inconvenience than some of those involving many times that number. Many of the larger strikes occurred in New York City and vicinity, where, in addition to those already mentioned, 35,000 waist and dress makers struck in January, 50,000 cloak and suit makers in May, 25,000 shirt makers in July, 50,000 men's clothing workers in October, 16,000 millinery workers in September, 10,000 rag pickers and paper sorters in March, as many paper box makers in August, and as many pressmen in October, 14,000 painters in August, 15,000 shoe workers in February, 15,000 street car men in August, 16,000 marine workers in January, 17,000 harbor workers in March, 18,000 teamsters in October, 20,000 longshoremen in March, 25,000 ship-builders in November, 40,000 tobacco workers in July, and 40,000 tug and ferrymen in October. In March, 12,000 woolen operatives struck in Passaic, 24,000 silk workers in Paterson in February and 17,000 again in August, 32,000 textile workers in Lawrence in February, 30,000 in New Bedford in May, and 35,000 in Fall River in December. In July, 40,000 marine workers along the Atlantic coast struck, 20,000 meat cutters in cities along the Atlantic coast in August and again in October, 12,000 telephone operators in New England in April, 15,000 street railway men in Chicago in July, 10,000 building laborers in Chicago in June, followed by 13,000 carpenters in July, 15,000 carpenters in Columbus, Ohio, in May, 17,000 machinists in Toledo in May, 15,000 miners in Illinois in July, 10,000 railroad shopmen in western Pennsylvania in October, 15,000 steel workers in Pennsylvania in July, 43,000 anthracite miners in Pennsylvania in September, 10,000 tobacco workers in Philadelphia and 11,000 in Allentown in July, 15,000 in Porto Rico in January, and as many more in Tampa in October, 10,000 men in the building trades in Dallas in June, 28,000 metal workers in Seattle in January, and 25,000 workers in the shipyards of San Francisco and vicinity in February and 40,000 more in October.

The table following shows the number of strikes and lockouts in 1916, 1917, 1918, and 1919, by States and by sections of the country.

TABLE 2.—NUMBER OF STRIKES AND LOCKOUTS BEGINNING IN EACH YEAR, BY STATES AND SECTIONS, 1916, 1917, 1918, AND 1919.

The largest number of disputes occurred in the leading manufacturing States—New York, Massachusetts, Pennsylvania, Ohio, and Illinois—nearly one-half the strikes being in these States.

The table following shows the number of strikes and lockouts in cities in which 25 or more disputes occurred during 1916, 1917, 1918, or 1919.

TABLE 3.—NUMBER OF STRIKES AND LOCKOUTS IN CITIES IN WHICH 25 OR MORE DISPUTES OCCURRED IN 1916, 1917, 1918, OR 1919

City.	1916	1917	1918	1919	City.	1916	1917	1918	1919
Baltimore, Md.	39	36	45	22	New Orleans, La.	7	23	15	25

Newark, N. J.	55	50	36	30	Youngstown, Ohio.	27	1	5	13

The table following shows, by sex of persons involved, the number of strikes and of lockouts occurring during the four years under consideration:

TABLE 4.—NUMBER OF STRIKES AND LOCKOUTS BEGINNING IN 1916, 1917, 1918, AND 1919, BY SEXES.

Sex.	Strikes.				Lockouts.			
	1916	1917	1918	1919	1916	1917	1918	1919
Males.....	3,045	3,513	2,380	2,599	76	99	76	70
Females.....	122	158	87	86			3	1
Males and females.....	260	184	263	478	9	6	11	21
Not reported.....	254	469	502	90	23	21	15	29
Total.....	3,681	4,324	3,232	3,253	108	126	105	121

In 1919 the employees were connected with unions in 1,811 strikes and 102 lockouts; they were not connected with unions in 135 strikes and 1 lockout; in 27 strikes and 2 lockouts they were not so connected at the time of striking, but organized almost immediately thereafter; in 1,280 strikes and 16 lockouts the relation of employees to unions was not reported. In 1918 the corresponding figures were 1,830 strikes and 73 lockouts, 358 strikes and 4 lockouts, 26 strikes, and 1,018 strikes and 28 lockouts. In 1917 the figures were 2,297 strikes and 95 lockouts, 206 strikes and 3 lockouts, 55 strikes, and 1,766 strikes and 28 lockouts. In 1916 the figures were 2,364 strikes and 94 lockouts, 441 strikes and 5 lockouts, 70 strikes and 1 lockout, and 806 strikes and 8 lockouts.

The causes of strikes and lockouts were numerous. Aside from wages few strikes occurred in which the cause was confined to one matter in dispute. The principal causes are shown in the table following.

TABLE 5.—PRINCIPAL CAUSES OF STRIKES AND LOCKOUTS BEGINNING IN 1916, 1917, 1918, AND 1919.

Matter of dispute.	Strikes.				Lockouts.			
	1916	1917	1918	1919	1916	1917	1918	1919
Increase of wages.....	1,290	1,554	1,378	999	11	17	14	24
Decrease of wages.....	33	34	34	80	2	2	2	3

101 to 250....	395	358	369	436	4	10	13	19	Total.....	3,681	4,324	3,232	3,253	108	126	105	121
251 to 500....	348	284	275	328	6	3	9	13									

In 1919, in 2,399 strikes and 94 lockouts the number of persons involved was reported to be 3,950,411 and 162,096, respectively, or an average of 1,647 in strikes and 1,724 in lockouts. In 1918, in 2,080 strikes and 71 lockouts the number of persons involved was reported to be 1,196,928 and 43,061, respectively, or an average of 575 in strikes and 605 in lockouts. In 1917, in 2,279 strikes and 46 lockouts the number of persons involved was reported to be 1,208,121 and 19,133, or an average of 530 and 416, respectively. In 1916, in 2,603 strikes and 64 lockouts the number of persons involved was reported to be 1,546,735 and 53,182, or an average of 594 and 831, respectively.

TABLE 7.—INDUSTRY GROUPS IN WHICH THE LARGEST NUMBER OF STRIKES AND LOCKOUTS OCCURRED IN 1916, 1917, 1918, AND 1919.

Industry.	Strikes.				Lockouts.

In 1919, in 3,149 strikes and 116 lockouts the number of establishments involved in each was stated. Only 1 establishment was involved in each case in 1,945 strikes and 88 lockouts, 2 establishments in 131 strikes and 4 lockouts, 3 in 94 strikes, 4 in 51 strikes and 3 lockouts, 5 in 48 strikes and 2 lockouts, over 5 in 880 strikes and 19 lockouts. In 1918, in 2,987 strikes and 109 lockouts, the number of establishments involved in each was stated. Only 1 establishment was involved in 2,460 strikes and 80 lockouts, 2 establishments in 66 strikes and 4 lockouts, 3 in 41 strikes and 1 lockout, 4 in 23 strikes, 5 in 90 strikes, and over 5 in 307 strikes and 24 lockouts. In 1917, in 3,643 strikes and 113 lockouts, the number of establishments involved in each was stated. In each case only 1 establishment was

involved in 2,994 strikes and 84 lockouts, 2 establishments in 140 strikes and 3 lockouts, 3 in 69 strikes and 4 lockouts, 4 in 41 strikes, 5 in 18 strikes, over 5 in 381 strikes and 22 lockouts.

Tables 9, 10, and 11 relate to those strikes and lockouts which were reported to have ended during the four years under consideration:

TABLE 9.—NUMBER OF STRIKES AND LOCKOUTS ENDING IN EACH MONTH DURING 1916, 1917, 1918, AND 1919.

Year.	Janu- ary.	Feb- ruary.	March.	April.	May.	June.	July.	Aug- ust.	Sep- tem- ber.	Octo- ber.	No- vem- ber.	De- cem- ber.	Month not stated.	Total.

In 1919 the total duration of these strikes was 57,885 days, and of the lockouts 2,215 days, the average duration of the former being 34 days and of the latter 38 days. In 1918 the total duration of these strikes was 28,779 days and of the lockouts 1,116 days, the average duration of the former being 18 days and of the latter 31 days. In 1917 the total duration of these strikes was 25,077 days and of the lockouts 1,904 days, the average of the former being 18 days and of the latter 56 days. In 1916 the total duration of the strikes was 46,305 days and of the lockouts 3,375 days, an average of 22 days and 64 days, respectively.

Included in the above table as "not reported" are 81 strikes and 2 lockouts in 1919, 127 strikes and 4 lockouts in 1918, and 200 strikes and 3 lockouts in 1917, designated in the reports as "short," but their exact duration not being given.

In addition, there were, in 1919, 175 strikes and 13 lockouts; in 1918, 79 strikes and 8 lockouts, and in 1917, 95 strikes and 1 lockout in which the places of the employees were filled very soon after the strike occurred, and the work became normal in a few days, but the Bureau has no record that these disturbances were ever formally settled.

In 1919 the number of unauthorized strikes of which the Bureau has information was 125, involving 1,053,256 strikers. In 1918 the number was 58 and in 1917, 72. Between April 6, 1917, the date of our entrance into the war, and November 11, 1918, the date of signing the armistice, 6,205 strikes and lockouts occurred.

The table following shows the number of strikes and lockouts in 1918 and 1919 in the leading industries and occupations, by States:

CURRENT NOTES OF INTEREST TO LABOR.

Efficiency of Labor Increasing.

The question of the present efficiency of labor was the subject of a recent investigation by the research department of the National Association of Credit Men, and the results of the answers to a questionnaire which was sent to a list of representative manufacturers were summarized in the May issue of the Credit Monthly. The questionnaire covered the following points: (1) The efficiency of labor in March, 1920, as compared with December, 1919; (2) present efficiency as compared with so-called normal times (1913-14); (3) reasons for reduced efficiency when present conditions are unsatisfactory; (4) the reasons for the increase in efficiency if present conditions show improvement.

Replies were received from 169 manufacturers located in all sections of the country, and an analysis of the answers led the author, Dr. Whyte, to conclude first that there is a good deal of exaggeration in the often repeated statement that labor in this country is only 50 or 60 per cent as efficient as it was before the war, and, second, that the year 1920 is so far showing an increase in efficiency.

In reply to the question, "Is your labor more efficient now than it was three months ago?" 57, or 34 per cent, of the 167 firms replying reported an increase in efficiency; 72, or 43 per cent, reported no improvement; and 10, or 6 per cent, reported a decrease in efficiency, while 18 companies thought that, although there was no improvement shown, labor was as efficient as in prewar times, and 10 stated that old labor showed as much efficiency as in the prewar period but that new labor was inefficient. Since more than one-third of these firms believed that conditions in this respect had improved, as against 6 per cent who reported a reduction in efficiency, altogether an increase of production for the three-month period was shown.

On the other hand, the replies to the question comparing the present with the so-called normal period show that production is not yet up to the prewar standard. Seventy per cent of the 169 companies answering this question stated that they did not believe that labor is as efficient now as it was in 1913-14. Thirteen of these employers, however, attempted to make a percentage comparison which, when averaged, showed a relative efficiency at present of 73 per cent, and while the number reporting was too small to form a general estimate it was considered that it refutes in a measure the charge that the relative degree of efficiency reaches as low a point as 50 or 60 per cent. Twenty-seven, or 16 per cent, believed that labor is as efficient now as formerly, but only 3 per cent considered that efficiency has reached a standard beyond that of normal times.

The reasons assigned for lowered production show that a large number of employers attribute it to labor shortage. The causes

next in order of importance are given as industrial unrest, high rate of labor turnover, high wages, reaction from the war, and high cost of living, while in a few instances the blame was laid upon organized labor, the high wages paid by the Federal Government during the war, lack of interest, general extravagance, shorter hours, housing shortage, radical social agencies, and prohibition.

Causes for increased efficiency were attributed to profit sharing, bonuses, high wages, industrial welfare work, improved methods of management, abatement of industrial unrest, and education of employees along economic lines.

Apprenticeship in Wisconsin.

THE Industrial Commission of Wisconsin has as one of its functions the supervision of a system of apprenticeship. This is the only State in the Union in which such a system exists, or in fact in which apprenticeship receives real attention from the State. A brief report¹ by the commission sets forth the reasons for the attempt at standardization that has been entered upon by the State, with representative standards or schedules worked out for application to certain trades. Provision is made for a variety of establishments and equipment so as to avoid difficulties due to an unnecessary rigidity. The schedules presented relate to the metal trades, covering the occupations of machinist, automobile machinist, toolmaker, boiler maker, and metal pattern maker; the building trades, including bricklayers, plasterers, and plumbers; the allied printing trades, including compositors, and lithographic transferrers; unclassified trades, including shoemakers, bakers, custom tailors, milliners, jewelry engravers, jewelers, and barbers. Thirty questions and answers intended to explain and enforce the principles involved conclude the pamphlet. On the satisfactory completion of the apprenticeship the apprentice receives a diploma issued by the State under the seal of the industrial commission and countersigned by the employer. What constitutes a satisfactory completion of the apprenticeship is determined by the commission.

A Home-Building Experiment in Manchester, England.

IN THE April, 1920, issue of The Labor Gazette, issued by the Canadian department of labor, there is a brief account of a labor enterprise of an unusual character which has been inaugurated in Manchester, England.

The housing committee of the city corporation has agreed to the proposition of the building guild, a newly formed federation of building trades, to erect 1,000 houses in Irlam, a suburb of Manchester. The municipality is to provide the funds while the guild is to furnish

¹ Apprenticeship in Wisconsin. Third report. Industrial Commission of Wisconsin [Madison], 1919, 18 pp.

not only the manual labor but also the technical and administrative workers. The city is to pay the labor cost and 10 per cent additional, and is to receive the houses when they are built. The workers are to get full week's wages even though the work is delayed because of inclement weather. The extra 10 per cent is to cover (a) losses ensuing from the full-week system; (b) purchase of plant, such as scaffolding, etc.; (c) transportation cost. The city council is to buy the building material, as it was thought a public body could best handle this matter under present circumstances. In carrying on the work the guild will be represented by an executive committee which will include administrative and technical advisers. "The entire working force is to be subject to the direction and discipline of men in good union standing." Provision is made for full-week or "all-weather" employment by having "one staff for both inside and outside work." In fine weather all the workers are concentrated on outside jobs and in wet weather they are shifted to inside jobs. This method will result in having many houses at different stages of completion at one time and calls for a correspondingly large working capital, but Manchester stands ready to meet this difficulty. It is alleged that this guild scheme is an advantage to the worker because it insures him regular payment and gives him a sense of responsibility to the public.

Middle Classes Union of Great Britain.¹

AROUSED by the enormous weekly amounts that were being paid in out-of-work donations, appalled by the menace of strikes in mines and on railways, and in other essential industries, by increasing income taxation, and the rising cost of living, and feeling that existing and prospective housing legislation should also benefit the British middle classes, representatives of these classes held a crowded meeting on March 6, 1919, at Cannon Street Hotel, London, which resulted in the organization of the Middle Classes Union.

In addressing the assembly, the chairman is reported to have said:

If you are properly organized, you will be the greatest force in the nation. You can possibly hold up all the workers. You could hold up the capitalists or you could even hold up the Government. You must see you are not squeezed or crushed and that you are placed in such a position as will necessitate a fair and square deal in all things and the right to live.

Early in March, 1920, the union celebrated the first anniversary of its organization.

Notwithstanding the special difficulties besetting the organizing of the Middle Classes Union, because of the variety of political viewpoints and individual interests of its members, according to a report made to the press by Capt. Stanley Abbott, the secretary, that organization already has 140 branches in various parts of the country. Many branches have a membership of as many as 1,500. Sections of the union are to be found in London. The home counties, the south, the midlands, and Scotland also have their Middle Classes

¹ Compiled from data in London Times, Mar. 7, 1919; and Christian Science Monitor, Jan. 16, Feb. 9, Apr. 20, and May 6, 1920.

Unionists. The Brighton and Hove branch has become so large that it is being divided in two.

The policy of the union is summarized as follows:

1. The strongest measures against Bolshevism.
2. The prevention of industrial nationalization.
3. The suppression of profiteers in exploitation and sectional tyranny.
4. More equitable distribution of taxation.
5. Representation of the "middle interests" in all political and

economic affairs.

The "challenge which certain classes of labor offer to what the middle classes believe to be essentially right in the existing social order" brought about the formation of the union. The "continued existence of this challenge on the one hand, together with the aggressive policy of pure capitalism on the other," is the reason for the union's continued activity.

The Middle Classes Union does not consider itself a "strike breaker," but it is resolved to keep the whole community from being held up by any one part of the community. The union plans to aid in the carrying on of essential public services in emergencies and to ward off "lightning strikes."

Members of the Middle Classes Union are asked to back candidates who stand for the union's principles, regardless of such candidates' party affiliations. The union prepares lists of questions which are sent out to candidates for Parliament and members of the union are counseled to support candidates answering these questions satisfactorily. If all of the candidates do so, members may choose according to party lines.

The Middle Classes Union has appointed a taxation committee of experts who submitted evidence to the Royal Commission on Income Tax. The union is also represented upon the Board of Trade central profiteering committee, as well as other governmental committees.

Recent efforts have been made to organize the Association of Engineering and Shipbuilding Draftsmen, the Electrical Power Engineers Association, the Railway Clerks Association, the National Association of Colliery Managers, the Bank Officers Guild, the National Union of Journalists, the Actors Association, and the Association of Industrial Chemists into a federation of "black-coat" workers, "under the ægis of the Labor Party," which have been met by a countermovement to constitute these workers into a "third party" independent of manual workers and employers. If these black-coat organizations are not affiliated with the Middle Classes Union there is at least a likelihood that some of these associations will be represented on the grand council of that union. At any rate the trend of the black-coated workers toward "an alliance with labor" has received a check. However, this does not make it an easy task to forecast the future of the Middle Classes Union.

In connection with this brief account of the British Middle Classes Union, it is interesting to note that Hon. Edward James Gavegan, justice of the supreme court of New York, recently approved incorporation articles for "The Public Union (Inc.)," described as "a growing union of middle-class people," the aim of which is "to benefit in any way those who are not either organized manual laborers or high-salaried executives." Other aims of this new union that

are cited in the petition are "to help relieve class oppression; to protect the public by lawful means from industrial and commercial oppression; to regulate and classify all forms of voluntary service; to serve in emergency crisis and to secure representation of all middle interests in all legislative action."¹

Census of Home Workers in Switzerland.²

A RECENT census of home workers in Switzerland brought out the fact that 70,874 homes are carrying on home work and that the number of home workers is 92,136. The home industry in Switzerland represents 12.4 per cent of the total number of undertakings (571,498) and the home workers 5 per cent of the total number of workers (1,851,599).

The textile industry contains the largest proportion of homes and workers carrying on home work. Embroidery occupies the most hands (35,887) and is carried on chiefly in the canton of St. Gall, but also in Appenzell and Thurgau, and in the cantons of Zurich, Schwytz, Glarus, and Grisons. Silk weaving, which occupies 12,478 home workers, is carried on mostly in the cantons of Zurich, Schwytz, and Outer Rhoden. The manufacture of silk ribbons, which occupies 7,557 home workers, is confined almost exclusively to Basel firms; the workers are to be found in the cantons of Basel (city and country), Aargau, and Soleure. The watch industry occupies 12,071 home workers but is tending to become more confined to the factories. The straw plaiting industry, which occupies 6,095 home workers, is also tending to become a factory trade by reason of the complicated articles made on looms. The chief seat of the industry is in Aargau; the home workers extend to the cantons of Lucerne, Freiburg, Obwald, and Tessin.

A census taken in the winter would show a much larger number of home workers.

Unrest Among Agricultural Labor in Northern Italy.

An article on the agrarian crisis in northern Italy appeared in the *Gazette de Lausanne* (Mar. 7, 1920) and is summarized in the *Economic Review*³ as follows:

At the beginning of February the Federation of the Cooperative Societies of Agricultural Laborers in the Province of Ferrara addressed to the employers' association a memorial demanding certain economic concessions. The federation, as is its wont, accompanied the memorial with a threat to strike. As the federation is an extremely powerful organization, and as the strike would occur at a moment when the spring sowings are commencing, the situation is of a nature to preoccupy not only the land-owners but the entire nation.

The movement soon spread to the Provinces of Rovigo, Verona, Bologna, and Reggio, the large district below the Appenines and the Trentino Mountains. The demands of the workers' syndicates are as follows: The organization of agricultural laborers must be given the sole right to decide as to the distribution of work, as to the share of the produce of the soil to be given to the workers, and as to the arranging for the accommodation of laborers on the farms and even in the houses of the owners. The syndicates also demand a reduction of the working day to seven hours, and even

¹ Evening Star, Washington, Apr. 23, 1920.

² *Gazette de Lausanne*, Lausanne, Mar. 12, 1920.

³ Review of the Foreign Press. *Economic Review*, London, Mar. 24, 1920, p. 517.

to six hours for eight months of the year. The minimum wage for ordinary work is to be raised from 1.50 to 2.75 lire (29 to 53.1 cents, par) per hour. The time occupied by the laborers in proceeding to work and getting tools ready is to be counted as working time. According to the new wage schedules demanded the driver of a team of oxen would receive in money and in kind 6,000 lire (\$1,158, par) per year.

The strike in the Ferrara district was postponed for 10 days because many of the laborers disapproved of these exaggerated demands and were unwilling to obey the orders of the federation of syndicates. On the other hand, the strike commenced on the appointed day in the Rovigo district. The whole movement is but an episode in the struggle carried on for years by the federation, whose aim is to transfer the ownership of the land to the laborers.

It has usually happened in Italy that in districts where peasant proprietorships have been established the socialist campaign is powerless. In Mantua, for example, 25 years ago agrarian socialism was rampant. The land was split up into farms of 60 to 70 hectares (148 to 173 acres), each giving employment to numerous laborers. The landowners then decided to subdivide the farms into holdings of 5 and 6 hectares (12.4 and 14.8 acres), each cultivated by a single family. These holdings were then let to the most intelligent among the peasants. The result was that socialist agitation ceased entirely. A similar procedure is now to be adopted in the Ferrara district, and it is hoped that it may have a like result.

Resolutions of Conference of Employers and Employees of South Africa.¹

THE conference of employers and employees called by the Government of the Union of South Africa to meet at Pretoria, November 3-7, 1919, and again on December 8-11, and attended by delegates representing every class of employers, including mining, manufacturing, State, municipal, commercial, etc., and delegates representing various labor organizations and other associations of employees, adopted unanimously resolutions favoring—

(1) Recognition of employees' organizations by employers of labor; (2) the registration of voluntary industrial agreements entered into between representative bodies and employers and employees in any industry, and the application of the terms of such agreements to the whole of the persons engaged in that industry, either locally or throughout the Union as required; (3) the establishment of joint boards as the best means for regulation and constant exchange of views between employers and employees, and that the method of selection of representatives on the various joint boards, conferences, etc., representing both employers and employees, should (except in the case of employers' representatives in Government departments) be entirely in the hands of the unions or organizations concerned, where such exist, and should be free from Government direction or ratification, direct or indirect; (4) legislation establishing the principle of a minimum wage based on a minimum standard of living; (5) the principle of equal payment for equal work, irrespective of the sex of the person performing such work; (6) the provision of adequate and comfortable housing of the workers by the Government by means of a national housing scheme; (7) the principle of a half holiday on one afternoon per week in all trades, industries, and occupations where such is feasible; (8) legislation to limit profits on the necessities of life; (9) an act for the regulation of apprenticeship.

Other resolutions adopted, but not unanimously, relate to nationalization of industries; a 48-hour week as a maximum for any industry, with a 44-hour week wherever practicable, and 40-hour week for workers in underground or hazardous occupations; the application of minimum-wage legislation on national lines; the abolition of systematic overtime in any industry; and the adoption of legislation providing a complete scheme of registration for all unemployed persons.

PUBLICATIONS RELATING TO LABOR.

Official—United States.

COLORADO.—*State inspector of coal mines. Seventh annual report, 1919. Denver, 1920. 78 pp.*

Tables devoted to mining accidents show 91 fatalities and 1,283 injuries, 1 being permanent total, 25 permanent partial, and 1,257 temporary disabilities. Of the last, 682 caused a time loss of more than 14 days.

ILLINOIS.—*Industrial Commission. Annual report for fiscal year ending June 30, 1919, and statistical report for calendar years 1918 and 1917. Springfield, 1920. 49 pp.*

A brief review of this report appears on pages 175 and 176 of this issue of the REVIEW.

KENTUCKY.—*Department of Agriculture, Labor and Statistics. Bureau of Labor. Ninth biennial report, and report of Bureau of Immigration, 1918-19. Frankfort [1920]. 225 pp.*

In this report the commissioner of agriculture, labor and statistics recommends that the labor bureau be made a separate department headed by a commissioner of labor who shall be elected at the same time and in the same manner as the heads of other State departments. Provision for a woman's division in the department is also recommended. It is urged that the legal period of employment for women be reduced to eight hours per day, that one day's rest in seven be made compulsory, that the minimum period allotted for meals be three-quarters of an hour, that a rest period of 10 minutes be demanded for the middle of each working period without thereby increasing the length of the working day, that no woman be employed between the hours of 10 p. m. and 6 a. m., and that equal pay for equal work be demanded in behalf of woman workers.

The report of the bureau of immigration and state free employment states that between December 1, 1917, and November 30, 1919, there were 2,223 applications for employment by males and 750 by females. During the period 1,852 males and 534 females were placed in position.

— *Workmen's Compensation Board. Annual report, June 30, 1918, to June 30, 1919. [Frankfort, 1919.] 82 pp.*

A digest of this report appears on pages 176 and 177 of this issue of the REVIEW.

LOUISIANA.—*Department of Labor and Industrial Statistics. Tenth biennial report, 1919-1920. New Orleans, 1920. 208 pp.*

MASSACHUSETTS.—*Bureau of Statistics. Thirty-third annual report on the statistics of manufactures for the year 1918. Boston, 1920. 133 pp. Public document No. 36.*

This report covers returns from 9,695 establishments and states that "manufacturing operations in 1918 quite generally reflected the extraordinary conditions which had characterized the preceding 12 months of 1917 and registered results surpassing all records." The average number of wage earners employed was 719,210, as against 708,421 in 1917. Whereas in 1917, 495,831, or 70 per cent of the total, were men, in 1918 the number fell to 489,237, a loss of 1.3 per cent. This decline was offset by an increase of 8.2 per cent in the number of women wage earners, the total rising from 212,590 in 1917 to 229,973 in 1918. The total amount paid to labor during the year was \$679,401,273, as compared with \$537,144,629 in 1917, an increase of \$142,256,644, or 26.5 per cent. The average yearly earnings for all wage earners, without distinction as to age, sex, or skill, rose to \$944.65 per capita, as compared with \$758.23 in 1917 and \$569.43 in 1913.

MASSACHUSETTS.—*Department of Labor and Industries. Division of statistics. Forty-eighth quarterly report on employment in Massachusetts, quarter ending December 31, 1919. Boston, 1920. 26 pp.*

The outstanding feature of the labor market during the final quarter of 1919 is stated to have been the continued undersupply of skilled workers in practically all of the principal trades, with an additional shortage of unskilled operatives in certain industries. The total number of strikes reported for this quarter was 78, as compared with 188 for the preceding quarter. Approximately 52,000 wage earners were involved. The estimated cost of new buildings and alterations for which permits were granted in 36 cities making reports to the department during the quarter was \$26,606,-195, as compared with \$27,746,966 for the third quarter, or a decrease of 4.1 per cent. Activity in the boot and shoe industry, the textile industry, iron and steel manufacturing, and printing and publishing was above normal; in steam and electric transportation practically normal; and in paper products "intense." Returns from 1,244 organizations, representing an aggregate of 273,673 members, show that at the close of December, 1919, 16,438, or 6 per cent of the total number of members, were unemployed for all causes. The corresponding percentage for the close of the preceding quarter was 5.4, but it was higher for the close of December in each year of the past decade, except 1916. The three State employment offices report 37,615 positions filled during the year, as compared with 39,735 for 1918, or a decrease of 5.3 per cent. The number filled by females decreased by 387, or 2.1 per cent, while that filled by males decreased by 1,733, or 8.1 per cent.

—*State Board of Labor and Industries. Sixth annual report, 1918. Boston, January, 1919. 65 pp. Public document No. 104.*

The report of the board on inspection work shows that the total number of orders issued for the year was 12,283, of which 5,785 referred to labor, 4,467 to industrial health, and 2,031 to industrial safety. There were 2,216 complaints made to the department during the year, divided as follows: Overtime employment, 353; nonpayment of wages, 1,202; violation of eight-hour law on public works, 13; health and sanitation, 270; advertising for help without stating "strike on," 31; one day of rest in seven, 26; preference of citizens, 14; prevailing rate of wage, 3; no time notice posted, 17; employing minors without certificate, 45; employing minors under 14, 61; labor, general (including intimidation of employees, fines, employment on legal holidays, etc.), 91; miscellaneous, 90. During the year the department issued 2,031 orders for industrial safety in manufacturing and mechanical establishments, and investigated 1,548 typical injuries occurring to workmen engaged in different industries in the State. The report on the administration of the weekly payment law states that 1,202 complaints were filed during the year.

The final report of the War Emergency Commission, created shortly after the declaration of war by the United States, is included in this volume.

NEW JERSEY (Newark).—*Evening technical courses of the Newark technical school. Annual bulletin, 1920-1921. Newark [1920.] 45 pp.*

A detailed outline of the technical, trade, and preparatory courses offered by the Newark Technical School to night students for the school year, 1920-21.

OHIO.—*Industrial Commission. Union scale of wages and hours of labor in Ohio on May 15, 1919. Columbus, December 17, 1919. 35 pp. Department of Investigation and Statistics, Report No. 38.*

This pamphlet gives the union scale of wages and hours of labor of street car employees and teamsters and chauffeurs, and of various occupations in the bakery, building, metal, and printing trades. The regular rates per hour, the overtime rates, and the Sunday and holiday rates are given; also the hours of labor per full day and per week, and in most instances, the hours of labor per short day and the number of months in the year in which the half holiday is in effect.

OREGON.—*Industrial Accident Commission. Third report showing the cumulative experience for the three-year period ending June 30, 1918. Workmen's compensation law. Salem, 1920. 81 pp.*

A summary of this report is given on pages 178 and 179 of this issue of the REVIEW.

— — — *Industrial board. Bulletin of Information. Nos. 1, 2, 4, 5, 7, 8, 9, Nov. 3, 1919–May 15, 1920. Mimeographed.*

The initial copy of this bulletin states that its purpose is to keep the members of the department informed of the work of the industrial board and to invite cooperation in the interests of the entire department.

PORTO RICO.—*Department of Agriculture and Labor. Report, 1919. Washington, 1919. From the report of the Governor of Porto Rico, 1919, pages 685–718, inclusive.*

TENNESSEE.—*Bureau of Workshop and Factory Inspection. Seventh annual report, 1919. Nashville, 1920. 73 pp.*

Material changes made by the general assembly in the labor department—formerly known as the State factory inspection department—include the making of the department a subsidiary bureau of the State mining department, the chief mine inspector being given general control and direction of the new bureau of workshop and factory inspection, and the giving to the bureau, by enactment of the workmen's compensation law, the handling of accident reports, and the adjustment of compensation claims and settlements. This report includes a directory of industries inspected, with the number of employees; and sections on woman labor in Tennessee, Regulation of child labor, Industrial accident reporting, and workmen's compensation law.

WASHINGTON.—*Industrial Insurance and Medical Aid Department. Eighth annual report for the 12 months ending September 30, 1919. The Workmen's compensation act. Olympia, 1920. 95 pp.*

A brief review of this report appears on pages 179 to 181 of this issue of the REVIEW.

WISCONSIN.—*Industrial Commission. Apprenticeship in Wisconsin. Third report. [Madison] 1919. 18 pp.*

A brief summary of this report is given on page 220 of this number of the REVIEW.

WYOMING.—*Coal Mine Inspector. Annual report, 1919. Cheyenne, 1920. 71 pp.*

Twenty-five fatal and 146 nonfatal accidents were reported in district No. 1, as compared with 30 fatal and 190 nonfatal accidents for the previous year. As 4,902 men were employed in and around the mines, the ratio of fatal accidents per 1,000 men employed was 5.1 and of nonfatal accidents 29.78. The number of fatal accidents reported by district No. 2 for 15 months ending December, 1919, was 17 and of nonfatal 44.

— — — *Workmen's Compensation Department. Fourth report, 1919. Laramie, 1920. 165 pp. Employer's number.*

This report is noted on pages 181 and 182 of this issue of the REVIEW.

UNITED STATES.—*Department of the Interior. Bureau of Mines. Metal-mine accidents in the United States during the calendar year 1918. Washington, 1920. 113 pp. Technical paper 252.*

A brief review of this report appears on pages 164 and 165 of this issue of the REVIEW.

— — — *Federal Board for Vocational Education. Employment management. Washington, January, 1920. 34 pp. Employment management series No. 1. Bulletin No. 50.*

The functions of an employment manager are defined in the report as follows: Hiring shop employees and sometimes office employees as well; taking charge of transfers and discharges; assisting in determining rates of pay; supervising working

conditions; adjusting grievances; and studying the causes of labor turnover and methods of reducing it. The relative weights of the five principal qualifications necessary in the successful employment manager are: Personality, 35 per cent; general industrial experience, 25 per cent; executive experience, 20 per cent; shop experience (for employment managers in manufacturing establishments), 15 per cent; experience with organized social movements, 5 per cent.

While the employment manager idea spread rapidly during the war, it has been estimated that only about 10 per cent of the factories which are large enough to support central employment departments have started them.

UNITED STATES—*Federal Board for Vocational Education. The labor audit, a method of industrial investigation.* Washington, January, 1920. 48 pp. *Employment management series No. 8. Bulletin No. 43.*

The subjects covered in the labor audit are grouped under three general heads: The employment organization, which comprises working conditions, turnover, job analysis, methods of selection and of starting work, and training; the outside economic and industrial forces not under the control of the management but with which it has to deal; and the wages and total earnings, which include the form and efficiency of management, the amounts and methods of pay, and various welfare provisions.

The labor audit is useful to the management as a method of standard record and analysis and as an aid in solving the particular industrial problems of the plant; to the personnel manager because it affords the broadest view of the problem he has to meet and helps to formulate his policy; to the workers because it will, if fairly conducted, serve as a means for correcting the injustices from which they may suffer; and to the community because of the dissemination of knowledge, which in the event of labor disputes will enable the public to exert an influence according to the facts of the case. In general, it should result in a comprehensive and far-sighted program for bettering conditions and establishing a more just relationship.

— *The turnover of labor.* Washington, November, 1919. 60 pp. *Employment Management Series No. 6. Bulletin No. 46.*

A study of the relative extent of turnover among different classes of employees shows, as would be expected, that it is usually much greater among the unskilled workers than among the skilled or the clerical employees. It is stated that the proportion of turnover due to discharges is often much exaggerated and that a comparison of postwar with prewar figures for certain groups of establishments shows a reduction of almost one-half in this class of separations. This improvement is ascribed to two reasons: The great demand for labor during the war and the consequent reluctance to "fire" unnecessarily and the improvement in employment methods and establishment of centralized employment departments. A summary of measures which have been advocated as necessary for the maintenance of a stable working force is as follows: "(1) Good pay and steady work; (2) the careful selection and placement of help; (3) a well-organized employment department; (4) installation of some system for the hearing and adjustment of complaints."

— *The wage-setting process.* Washington, November, 1919. 32 pp. *Employment management series No. 5. Bulletin No. 44.*

In determining a wage in proportion to the task, consideration is given to the quantity and quality of the product, the amount of energy required or of fatigue produced, and to the nature of the working conditions. In order to fix standards it is necessary to analyze all these elements and upon determination of a standard process and of standard working conditions it is possible to fix a standard space or a proper work-and-rest schedule. To do this, time studies and fatigue studies must be made. The payment methods, which include the day rate, the ordinary piece rate, differential piece rates, and various bonus and premium plans, are discussed.

UNITED STATES.—*Federal Trade Commission. Food investigation. Report on private car lines, June 27, 1919. Washington, 1920. 271 pp.*

Official—Foreign Countries.

AUSTRALIA (NEW SOUTH WALES).—*Board of Trade. Declaration of the 23d December, 1919, as to the living wage to be paid to adult female employees. Sydney, 1920. 3 pp. Published in Government Gazette No. 2 of 2d January, 1920.*

——— *Department of Labor and Industry. Report with an historical review on the operations of the department during the year 1918. [Including the 22d series of annual reports of inspectors under the factories and shops act, 1912.] Sydney, 1920. 183 pp. Illustrated.*

Sections are devoted to the ministerial office, board of trade, special commissioner for conciliation, industrial registrar's office, office of chief inspector of factories and investigation officer, State labor exchanges and immigration branch, office of departmental engineer and chief inspector of scaffolding and lifts, and gas examiner's office. Figures covering the operation of the Workmen's Compensation Act, 1916, for the year 1918 show that there were 69 death cases in which compensation was payable under the act, as against 34 for the preceding year, and 65 in 1914; incapacity cases compensated by weekly payments increased by nearly 150 per cent, the number being 4,689 in 1917, and 11,504 in 1918. The total compensation paid increased from £52,358 (\$254,800.21, par) in 1917 to £117,384 (\$571,249.24, par) in 1918. Seventeen cases of industrial diseases due to employment were reported as follows: Lead poisoning, 10 cases; nystagmus, 5; cellulitis of arm, 1; phosphorus poisoning, 1. The total compensation paid in respect of these injuries was £367 (\$1,786, par).

——— (ONTARIO).—*Bureau of Municipal Affairs. Report re housing for 1919 including reports of officials, statements as to operations of housing commissions, plans, etc. Toronto, 1920. 140 pp. Illus.*

Report of activities under the Ontario Housing Act, March 20, 1919, during the first year of its operations. Ninety-nine cities in Ontario have housing commissions, and 68 have commenced the building of houses under the scheme of Government loans for that purpose. Of the total Federal loan Ontario's share was \$8,753,291.93, and the Province agreed to add \$2,000,000. The total appropriated to municipalities is \$10,629,000. If all requirements of the municipalities are met for 1920 about \$8,000,000 will be necessary for housing loans. The number of houses erected by the cities is 1,184; the total loans made on them, \$3,677,974; and the average loan per house, \$3,106.40. Practically two-thirds of the houses for which loans have been made have six rooms.

CANADA (ONTARIO).—*Bureau of Municipal Affairs. Housing Committee. Report on the treatment of the surroundings of the small home; including (1) the subdivision of land for industrial housing and (2) the layout of the individual lot. Toronto, 1919. 85 pp.*

— (QUEBEC).—*Bureau of Statistics. Statistical year book. 6th year. Quebec, 1919. xvii, 666 pp.*

Part 6 of this report is devoted to organized labor, giving a brief summary of the provisions and operation of the Quebec Trades Disputes Act, and summaries of the Workmen's Dwellings Act and the Minimum Wage Act. Other labor legislation is cited. A tabulation shows a total of 366 trades unions with a membership of 48,570 in 1918, or an increase of 73.4 per cent over 1917. There are brief strike statistics, covering the years 1901 to 1918, inclusive. The report includes a statistical statement of the work of the provincial employment bureaus from 1911 to 1918; and also a table of accidents to workmen, classified by trade or industry and by nature of accident. There were 154 fatal accidents in 1918, the largest number, 37, being in steam railway services.

— [Department of Labor.] *Laws concerning the inspection of industrial establishments and public buildings. Edited by Gustave Francey under the direction and approval of the Department of Labor of the Province of Quebec. Quebec, 1920. 132 pp.*

The title of this booklet does not indicate its scope, which is said in the "Foreword" to be a "compilation of labor laws" which "could justly be named the labor code of the Province of Quebec." It includes also the conventions and recommendations adopted by the International Labor Conference, held at Washington, D. C., October-November, 1919. All matter is given in both French and English. There is an index, and a roster of the officers and principal employees of the department of public works and labor, department of factory inspection, public employment service, etc.

DENMARK.—*Statistiske departement. Statistisk Aarbog 1919 udgivet af det Statistiske departement. Copenhagen, 1920. 252, 4 pp.*

Statistical yearbook of the Kingdom of Denmark for the year 1919 containing among other material summary tables of statistics of retail prices, workmen's compensation, sick benefit funds, unemployment relief funds, amount of unemployment, wages, hours of labor, wages of agricultural workers and domestic servants, apprentices, cooperation, and cost of living.

GREAT BRITAIN.—*Board of Trade. Industrial Life Assurance Committee. Minutes of evidence. London, 1920. 278 pp. Cmd. 618.*

— [Home Office.] *Committee on the use of lead in painting of coaches, etc. Report of the departmental committee appointed to investigate the danger attendant on the use of lead compounds in the painting, enameling, and varnishing of coaches and carriages. London, 1920. 43 pp. Cmd. 630.*

This report forms Volume II of a series of four reports, Volume III of which is listed below. It contains a summary of the evidence given, including testimony concerning experience with leadless materials, and an analysis of the evidence covering the extent of lead poisoning, principal sources of danger, and methods of dealing with lead poisoning.

— [Committees on the use of lead in painting.] *Reports of the departmental committees appointed to investigate the danger attendant on the use of paints containing lead in the painting of buildings and in the use of lead compounds in the painting, enameling, and varnishing of coaches and carriages. London, 1920. Cmd. 631.*

This report forms Volume III of a series of reports, Volume I of which, on the use of lead in the painting of buildings, was published in 1915, Volume II, listed immediately above, and Volume IV, containing the minutes of the evidence taken by both committees, not yet received. The appendixes give statistical tables, regulations of several countries in regard to the use of lead, and method of making tests and results

of these various experiments to determine the relative danger of different kinds of exposure.

— *Registrar of Friendly Societies. Reports for the year ending 31st December, 1917. Part C.—Trade Unions.* London, 1920. 43 pp.

This report, which relates to registered trade-unions only, states that during 1917 the membership of employees' unions reached 4,306,279, an increase of 19 per cent over 1916. The largest increases in total membership were in the general and engineering groups, which increases were over 210,000 and 140,000, respectively, while the greatest proportional increase was in the agricultural group, where the membership rose from 22,197 at the end of 1916 to 36,994 at the end of 1917. Female membership increased from 120,191 in 1914 to 447,401 in 1917. The income during the year was £5,807,776 (\$28,263,542, par), of which 83.2 per cent was contributed by members. During the year £1,703,241 (\$3,288,822, par) was expended on benefits to members, including unemployment, dispute, sick and accident, and superannuation.

CONSUMERS' LEAGUE OF NEW YORK STATE AND CONSUMERS' LEAGUE OF THE CITY OF NEW YORK. *Women's wages to-day: One reason for a legal minimum in New York State*. New York, February, 1920. 12 pp.

DEUTSCHER BUND HEIMATSCHUTZ UND VEREINIGUNG FÜR DEUTSCHE SIEDLUNG UND WANDERUNG. *Die Wohnungs- und Siedlungsfrage nach dem Kriege. Unter Mitarbeit zahlreicher Fachmänner herausgegeben von Carl Johannes Fuchs*. Stuttgart, 1918. XI, 455 pp. Illustrated.

This volume, issued under the auspices of the German Federation for the Protection of the Home and the Association for German Settlement and Migration by Dr. Carl Johannes Fuchs with the collaboration of a number of German authorities on housing work, evolves a post bellum program for housing and settlement work in Germany. The introduction to the volume discusses the historical development of workmen's housing in Germany, Austria, and foreign countries, especially in England and Belgium, the housing density in London, Paris, Greater Berlin, and Vienna, and the relation of rent to income. The first part of the volume treats of methods and means of producing housing and the economic and architectural considerations governing it. The second part deals with the tasks of the future and proposed reforms of the present housing system.

FUNRISS, A. D. SANDERSON AND PHILLIPS, MARION. *The working woman's house*. London, The Swarthmore Press (Ltd.), 1920. 84 pp. Illustrated. Plans.

Chapters are on The views of the woman in the home, The inside of the house, Cooperative house management, The healthy town, and The new housing act and women's needs.

GAEBEL, KÄTHE AND VON SCHULZ, M. *Die Heimarbeit im Kriege*. Berlin, 1917. 210 pp. Bibliography.

This volume deals with homework in industries in Germany in general and with homework during the war in particular. It discusses the provisions of the Industrial Code relating to homeworkers, The German homeworkers' law, Social insurance of homeworkers, The protective laws for homeworkers of foreign countries (England, Austria, France, Norway, and the United States), Employment of homeworkers in the manufacture of military equipment (leather articles and clothing), The organizations of homeworkers (trade-unions and cooperative societies), The employment of war invalids in homeworking industries, Homeworking combined with agriculture, and The future prospects of German homeworking industries.

GASTON, HERBERT E. *The Nonpartisan League*. New York. Harcourt, Brace & Howe. 1920. 325 pp.

This book is a history of the foundation and growth of the National Nonpartisan League, written from the sympathetic viewpoint of one who has been active in the affairs of the league.

GRUNSKY, C. E. *A commodity unit to supplement money as a standard of value*. In *Transactions of the Commonwealth Club of California*. San Francisco. March, 1920, pp. 5-22.

The various plans and theories being advanced by economists and business men for stabilizing the money unit or insuring against the shrinkage in value of long-time

credits are of interest at this period of the rapid decline in the purchasing power of the dollar. A paper on "A commodity unit to supplement money as a standard of value" was read recently by Mr. C. E. Grunsky before the Commonwealth Club of California, in which he advocated the establishment of a standard which should be fixed, not upon a metal, but upon a definite quantity of necessities such as food, fuel, etc., which are essential for the ordinary comfort of the family. In determining the commodity unit, or "com" as the author calls it, it is suggested that the quantities of each of the 250 or more articles which the United States Department of Labor uses when it fixes the general commodity "index number" should be taken in the proportion of family consumption which would at the average wholesale prices during the 10 years, 1900 to 1909, have been purchasable, for example, for \$1,000. One "com" would then be one thousandth part of these various quantities. After fixing upon this standard all transactions would be made in "coms" instead of in dollars and the payment would be made in money according to the relation existing at the time of payment between the two. The principle may be shown by the following illustration: If a loan is made in terms of "coms" instead of in terms of gold, 1,000 "coms" might be equal to \$1,130 at the time the loan is made, but when the capital is returned it will still be 1,000 "coms" although in terms of money it may be equivalent to more or less than \$1,130 according to whether the value of the dollar has gone up or down.

This system, the author claims, would be of particular value in every transaction in which the element of time enters, as, for instance, salaries, wages, rents, investments, and loans, and it could be introduced into the business and industrial life of the country with practically no difficulty.

HASKELL, ALLAN C. *How to make and use graphic charts.* New York. Codex Book Co. (Inc.). 1919. 539 pp. *Bibliography.*

This is an exhaustive study of the theory and construction of the various kinds of charts and of the uses to which they may be put. It contains illustrations and typical examples which may be adapted to individual requirements, and gives valuable directions for the proper use of charts and methods for getting the best results.

HOFFMAN, FREDERICK L. *The mortality from respiratory diseases in the glass industry.* In *Journal of Industrial Hygiene*, Vol. II, No. 1. Boston, May, 1920. Pp. 1-5.

In view of the excessive mortality from pulmonary tuberculosis and possibly from nontuberculous respiratory diseases among certain occupations in the glass industry, and of the inadequate data so far collected in regard to the special hazards of the industry, the author advocates an extensive investigation similar to that being carried on among the granite workers of Vermont by the committee on dusty trades of the National Tuberculosis Association with the cooperation of various other agencies. He says "It is sincerely to be hoped that such an investigation will be made so that the facts may be known, and if conditions prove to be better than assumed, a further reduction in extra premium charges for life insurance may accrue to the benefit of wage-earners in the glass industry, and material restrictions may be removed in the case of occupations at the present time considered doubtful."

INDEPENDENT LABOR PARTY (GREAT BRITAIN). *Pamphlets. New Series, No. 1, International socialism and world peace. Resolutions of the Berne Conference, February, 1919; No. 3, The mine owners in the dock. Startling disclosures: A summary of the evidence given before the coal industry commission.* London, 8 and 9, Johnson's Court, Fleet Street EC. 4, 1919. 15, 16 pp.

JOSEPHSON, AKSEL, G. S. *Bibliographical notes on some books about reconstruction.* Chicago, 1919. 11 pp. Elbert H. Gary Library of Law, Northwestern University Law School, Bulletin No. 2.

LEGGE, THOMAS M. *Industrial diseases under the Workmen's Compensation Act.* In *Journal of Industrial Hygiene*. Vol. II, No. 1, Boston, May, 1920. Pp. 25-32.

Deals with the results of scheduling notifiable industrial diseases under the Workmen's Compensation Act of 1906, Great Britain.

LEGGE, THOMAS M. *Twenty years' experience of the notification of industrial diseases. In Journal of Industrial Hygiene, Vol. 1, No. 12. Boston, April, 1920. Pp. 590-596.*

Cutter lecture in preventive medicine and hygiene, delivered at the Harvard Medical School, December 8, 1919. Figures are given which "emphasize the value to be obtained from notification of clearly defined industrial diseases when sufficient time is given by a medical man to the elucidation of the subject."

LIBRARY BUREAU. *Filing as a profession for women. Boston, 1919. 49 pp.*

LITCHFIELD, PAUL W. *The Industrial Republic. Akron, Ohio. The Superior Printing Co. 1919. 73 pp.*

The author sketches briefly the causes leading up to the present industrial unrest, the reasons for the warfare between capital and labor, and the present status of the labor-capital opposition. A remedy for industrial troubles is found by the writer in the establishment of shop committee systems following the plan of Government of the United States, as he believes conditions within industries are analogous to those the same individuals have to meet as citizens of the Republic.

MASTERMAN, J. HOWARD B., EDITOR. *Clerical incomes. An inquiry into the cost of living among the parochial clergy, by 11 diocesan contributors. London, G. Bell & Sons (Ltd.), 1920. 307 pp.*

A volume of essays which aims to show how pressing is the problem of the poverty of the English clergy rather than to propound a solution of the problem. The last chapter, however, deals with Remedies for the poverty of the clergy.

MAXWELL, A. V., COMPILER. *New South Wales industrial arbitration acts and regulations, with amendments incorporated to August, 1918. With a complete index. Sydney, The Law Book Co. of Australasia (Ltd.), August, 1918. 113 pp.*

MORTON, D. S. *The 40 hours strike: An historic survey of the first general strike in Scotland. Clydebank (Scotland), Thos. Kane, 52 Second Avenue, [1919]. 16 pp.*

NATIONAL CIVIC FEDERATION. *Social Insurance Department. Committee on Constructive Plan. A refutation of false statements in propaganda for compulsory health insurance. New York, Metropolitan Tower, October, 1919. 43 pp.*

NATIONAL COMMITTEE FOR CONSTRUCTIVE IMMIGRATION LEGISLATION. *A proposed act amending the immigration laws. New York, 105 East Twenty-second Street, April 25, 1920. 16 pp.*

The general character of the proposed changes are: (A) Rearrangement and grouping of existing provisions; (B) Providing for an immigration commission; (C) Limiting future immigration by annual determination by Secretary of Labor, on report of Commission as to "maximum number of aliens of each nationality" or "percentage of each ethnic group" on basis of (1) Record of previous assimilation of their immigrants into our citizenship; (2) Needs of our labor market, including domestic servants; (D) As thus limited, repealing discriminatory acts and those in contravention of United States treaties.

— *Proposed amendments to the naturalization laws. New York, 105 East Twenty-second Street, April 25, 1920. 2 pp.*

These proposed amendments embrace: (1) Raising the standards of naturalization; (2) Extending the privileges of naturalization to all who qualify; (3) Repealing existing laws inconsistent with these provisions.

NATIONAL CONSUMERS' LEAGUE. *Pamphlets. The eight-hour day and rest at night, by statute; Equal opportunity for women wage earners—facts vs. fiction; Standard minimum wage bill; Minimum wage commissions—current facts. New York, 44 East Twenty-third Street, 1920. 12, 10, 8, 15 pp.*

NATIONAL MARINE ENGINEERS' BENEFICIAL ASSOCIATION OF THE UNITED STATES OF AMERICA. *Journal of proceedings. Minutes of 45th annual convention, January 19-24, 1920. Buffalo, N. Y., George A. Grubb, secretary-treasurer, 356 Ellicott Building, 1920. 574 pp.*

PROSSER, J. E. *Piece-rate, premium and bonus. London, Williams & Norgate, 1919. 122 pp.*

Discusses scientific management, profit sharing, and the various premium and bonus systems in use, including the Halsey, Rowan, Emerson, and Knoeppel systems. In appendix a comparison of wage systems is made, and the Lever Bros. (Ltd.) copartnership scheme and profit sharing in the United States are considered.

RAILROAD LABOR ORGANIZATIONS. *Report of proceedings in connection with 1919-20 wage movement. Statement by the chief executives, signatory hereto, to their respective constituencies, setting forth fully the progress of our negotiations since February 3, when we entered into a discussion of the wage question with the Director General of Railroads. Washington, National Publishing Co., Feb. 16, 1920. 20 pp.*

— *Supplementary report of proceedings in connection with 1919-20 wage movement covering period February 15 to March 4, 1920. Washington, National Publishing Co., 1920. 14 pp. Circular No. 3.*

RETAIL SHOE SALESMEN'S INSTITUTE. *Materials in shoes. Volume 3, constituting part of the training course for retail shoe salesmen. Boston, 1920. 190 pp.*

SOUTHWESTERN INTERSTATE COAL OPERATORS' ASSOCIATION. *The strike history of district No. 14 of Kansas from April 1, 1916, to December 31, 1919. Kansas City, 1920. 31 pp.*

STARR, E. B. *Excessive mortality from influenza-pneumonia among bituminous coal miners of Ohio in 1918. In American Journal of Public Health, Vol. 10, No. 4. Chicago, April, 1920. Pp. 348-351.*

The author gives the following figures as illustrative of the excessive mortality from influenza-pneumonia among coal miners in Ohio:

The total deaths from all causes among Ohio coal miners in 1918 was 1,923, a rate of 19.2 per thousand employed, as against a total in 1917 of 571 deaths, or a rate of 11.1 per thousand employed. The latter rate is not far from that found by Hayhurst¹ among Illinois coal miners for the six and one-half year period, February 1, 1912, to July 21, 1918; namely, 10.8 per thousand employed.

Of 39,565 deaths from all causes among males 15 years of age and over, in Ohio in 1918 (excluding coal miners), 11,989, or 30.3 per cent. were due to influenza-pneumonia, whereas 458 deaths, or 4.7 per cent. of the total deaths among Ohio coal miners were due to influenza-pneumonia. Though these percentages certainly indicate a preponderance of influenza-pneumonia mortality among coal miners they do not in themselves represent the true relation when one considers the distortion resulting from the large mortality among miners due to deaths from violence. * * *. By eliminating this distortion, due to violence, the relation between influenza-pneumonia mortality percentages in coal miners and males of the State at large appears in a truer light. The percentage of total deaths due to influenza-pneumonia among coal miners is then 55.9 as against 33.1 among males of 15 years and over in the State at large.

¹ Hayhurst, E. R.: Report of the Health Insurance Commission, State of Illinois, May 1, 1919, pp. 376-402. *Journal of Industrial Hygiene*, 1, No. 7 (November), 1919, pp. 360-367.

If one may hazard the statement of a death rate from influenza-pneumonia among males of 15 years and over, in the State at large (excluding miners), based upon an estimate of 1,886,000 males, we may compute a rate of 635 per 100,000 as against a rate of 862.6 per 100,000 from the same cause among miners.

TIMKEN SERVICE BUREAU. *Industrial Department. Compromise methods of harmonizing the relations between workers and employers. A defense of premium and bonus plans of compensation.* Baltimore, Keyser Building, 1920. 10 pp.

TRADES UNION CONGRESS. *Parliamentary Committee. Trade-union movement and political issues.* London, 32, Eccleston Square, SW1. [1919.] 11 pp.

UNITED STATES STEEL CORPORATION. *Eighteenth annual report for the fiscal year ended December 31, 1919.* Hoboken, N. J. 1920. 52 pp.

VEILLER, LAWRENCE. *A model housing law. Revised edition.* New York, Russell Sage Foundation, 1920. 430 pp.

VERBAND DER GEMEINDE- UND STAATSARBEITER. *Protokoll der Verhandlungen der dritten Konferenz des Krankenpflege-, Massage- und Baderpersonals Deutschlands.* Berlin, 1920. 160 pp.

The minutes of the third conference of German hospital nurses and employees in massage and bathing establishments held at Jena. Nov. 30 and Dec. 1, 1919. The conference discussed the vocational training, the economic situation, and the organization of hospital nurses and the bill regulating their hours of labor.

WHITTAKER, CHARLES HARRIS. *The joke about housing.* Boston, Marshall Jones Company, 1920. ix, 233 pp.

This is a discussion of the housing problem not alone from the point of view of providing houses for the workers but also in relation to other problems related to the economic system, chiefly the question of land control.

ZENTRALVERBAND DEUTSCHER KONSUMVEREINE. *Jahrbuch. Siebzehnter Jahrgang, 1919. Hamburg, 1919. 2 vols. (1035, 1127 pp.).*

The yearbook of the Central Federation of German Consumers' Cooperative Societies for 1919, containing statistical data of the German cooperative movement, and particularly of the consumers' cooperative movement. Some of the data given are found in this issue of the MONTHLY LABOR REVIEW, pp. 132 to 135.

INDEX TO VOLUME X—JANUARY TO JUNE, 1920.
